A. Subject to compliance with requirements, provide grounding and bonding products of one of the following (for each type of product):
1. Grounding Products:
a. Compression Connectors:

(1) FCI Burndy.
(2) Thomas & Betts.

b. Exothermic Connectors:
(1) Burndy Weld.
(2) Erico.
(3) Harger.

c. Ground Rods:
(1) Conex.
(2) Erico.
(3) Harger.

d. Ground Cable:
(1) Harger.
(2) Nehring.
(3) Southwire.

e. Precast Ground Well Box:
(1) Brooks Products Model: 3-RT Valve Box.
(2) Christy Concrete Products Model: G12 Valve Box.

2.02 GROUNDING AND BONDING:

A. Materials and Components:

1. General: Except as otherwise indicated, provide electrical grounding and bonding systems indicated; with assembly of materials, including, but not limited to, cables/wires, connectors, solderless lug terminals, grounding electrodes, bonding jumper braid, surge arresters, and additional accessories needed for a complete installation. Where more than one type component product meets indicated requirements, selection is Contractor's code-compliance option. Where materials or components are not indicated, provide products which comply with NEC, UL, and IEEE requirements and with established industry standards for those applications.
2. Conductors:
   a. Unless otherwise indicated, provide insulated electrical grounding conductors for equipment grounding conductor connections that match power supply wiring materials and as a minimum are sized according to the NEC.
   b. Provide annealed, tin-coated, bare copper cable for ground electrode conductors. Size as indicated.
   c. Provide annealed, tin-coated, bare copper cable for buried ground system conductors.
   d. Provide annealed, tin-coated, bare copper cable for exposed ground system conductors.
   e. Tin-coated ground conductors shall meet ASTM B8 and B33.
   f. Bare copper ground conductors shall meet ASTM B3 and B8.
3. Service Surge Protection: Refer to Section 26 43 13 - Surge Protection Devices. Ground according to manufacturer’s instructions.
4. Grounding Bus: Predrilled rectangular bars of annealed copper, 1/4 by 4 inches (6.3 by 100 mm) in cross section, with 9/32-inch (7.14-mm) holes spaced 1-1/8 inches (28 mm) apart. Stand-off insulators for mounting shall comply with UL 891 for use in switchboards, 600V. Lexan or PVC, impulse tested at 5,000V.
5. Bonding Plates, Connectors, Terminals, and Clamps: Provide electrical bonding plates, connectors, terminals, lugs, and clamps as recommended by bonding plate, connector, terminal, and clamp manufacturers for indicated applications.

a. Bolted Connectors for Conductors and Pipes: Copper or copper-alloy, pressure type with at least two silicon bronze or stainless-steel bolts and lock washers.
b. Bolted Service Connectors for Structural Steel: Shall have high-conductivity bronze alloy bolts and corrosion-resistant copper alloy nuts.
c. Irreversible Compression Fittings: Pure wrought copper extrusion clamps and connectors, made to be held in the dies of an installation tool. Connectors must be factory filled with an oxide inhibitor.
d. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.
e. Bus-Bar Connectors: Mechanical type, cast silicon bronze, solderless exothermic-type wire terminals and long-barrel, two-bolt connection to ground bus bar.

6. Ground Rods or Ground Electrodes:
   a. Ground Rods or Grounding Electrodes: Copper-clad steel or copper-alloy, sectional type rods. One end pointed to facilitate driving, 3/4-inch diameter by 10 feet unless noted otherwise on plans.
7. Electrical Grounding Connection Accessories: Provide electrical insulating tape, heat-shrinkable insulating tubing, welding materials, bonding straps, as recommended by accessories manufacturers for type service required or indicated.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install electrical grounding and bonding systems as indicated, in accordance with manufacturer's instructions and applicable portions of NEC, NECA's "Standards of Installation," and in accordance with recognized industry practices to ensure that products comply with requirements.

B. A grounding electrode shall be installed at each building or structure as indicated.
   1. Grounding electrodes shall consist of the following:
      a. Ground rod and cable system.
      b. Concrete-encased electrode.
      c. Grounded metal frame of the building or structure.
      d. Metal underground water pipe.
      e. Other systems or structures as indicated.

C. Ground Rods:
   1. Install rods as indicated by driving and not by drilling or jetting.
   2. Drive rods into unexcavated portion of the earth where possible.
   3. Where rods must be installed in excavated areas, drive rods into earth after compaction of backfill is completed.
   4. Drive to a depth such that top of rods will be approximately 18 inches below final grade or subgrade, and connect main grid ground cable thereto.
   5. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
   6. Separation between ground rods shall be equal to or greater than the length of the rods.
   7. The ground electrode conductor shall not contain splices between the ground electrode and the service entrance equipment.
   8. For grounding electrode system, install at least three rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.

D. Counterpoise Ring: Install a grounding conductor, electrically connected to each building structure ground rod and to each steel column, extending around the perimeter of building.
   1. Install a ground conductor for the ground ring and for taps to building steel.
   2. Bury ground ring not less than 24 inches (600 mm) from building's foundation.

E. Test Wells: Test well handholes shall be at least 12 inches (300 mm) deep, with cover.
   1. Ground rod driven through drilled hole in bottom of handhole.
   2. Install at least one test well for each service unless otherwise indicated. Install at the ground rod electrically closest to service entrance.
   3. Set top of test well flush with finished grade or floor.

F. Grounding Conductors:
   1. Install solid conductor for No. 8 AWG and smaller, and stranded conductors for No. 6 AWG and larger unless otherwise indicated.
   2. Install using as few joints as possible. Route along shortest and straightest paths possible unless otherwise indicated or required by Code.
   3. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage. Suitably protect cable against damage during construction.
   4. Replace or suitably repair cable if damaged by anyone before final acceptance.
   5. In Exposed Installations:
      a. Route runs as indicated.
      b. Route along the webs of columns and beams, and in corners where possible for maximum physical protection.
      c. Where physical protection is required, install in PVC conduit unless indicated otherwise.
      d. Support at intervals of 3 feet or less with nonmagnetic clamp-type supports.
   6. In Buried Installations:
      a. Conductor sizes shall be as indicated for specific connections. For required connections not indicated, use conductor size not less than No. 3/0 AWG if buried in the earth or cast in concrete, or No. 6 AWG at other locations.
      b. Lay in bottom of trench or in other excavations at the depth of the top of the ground rod.
      c. Bury at least 30 inches (600 mm) below grade.
      d. Maintain clearance of at least 12 inches from all underground metal piping or structures, except where connections thereto are specifically indicated.
      e. Ground cable shall enter the bottom of electrical gear or panels sitting on a slab through a PVC sleeve.
   7. Backfill as specified in Division 31.
   8. Duct-Bank Grounding Conductor: Bury in duct bank as indicated as part of duct-bank installation.

G. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.

H. Ground Bonding Common with Lightning Protection System: Comply with NFPA 780 and UL 96A when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in conduit.

I. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.

1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.

J. Conductor Terminations and Connections:
1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors with silicon bronze or stainless-steel bolts and lock washers.
2. Underground Connections: Provide exothermic welded connections where grounding conductors connect to underground grounding conductors and underground grounding electrodes.
3. Connections to Ground Rods at Test Wells: Bolted connectors.
4. Connections to Structural Steel:
   a. Exothermically welded connectors where allowed by the structural steel.
   b. Bolted fittings where structural steel cannot be welded, but can be field drilled.
   c. Irreversible compression ground clamp with breakaway bolt head to building steel that cannot be altered.
5. Clean metal contact surfaces of clamp-on connectors to ensure electrical conductivity and circuit integrity.
6. Exothermic terminations:
   a. Conform to manufacturer's instructions.
   b. Chemically degrease and dry completely before welding.
   c. Apply one coat of mastic coating to all exothermic-welded connections to be buried.

K. Ufer Ground (Concrete-Encased Grounding Electrode): Fabricate according to NFPA 70; use a minimum of 20 feet (6 m) of bare copper conductor not smaller than No. 3/0 AWG for a grounding conductor.
1. If concrete foundation is less than 20 feet (6 m) long, coil excess conductor within base of foundation.
2. Bond grounding conductor to reinforcing steel matte in at least four locations using compression fittings designed for the intended purpose.
3. The grounding connection to the supplemental electrode shall be bonded by either exothermic welding or irreversible compression fittings.
4. Extend a bonding conductor from concrete-encased electrode, below grade and out to building's grounding grid and bond.
5. Extend a bonding conductor from at least one concrete-encased electrode out of the concrete and bond to the grounding electrode.
6. Welding Ufer grounding conductor directly to the structural steel is prohibited.
7. Bond Ufer ground to the metal frame of the building or structure:
   a. A concrete-encased electrode shall be exothermically welded or connected with an irreversible compression fitting to the hold-down bolts securing the structural steel column to the support footing or foundation.
   b. A pig-tail of copper from the concrete-encased electrode shall penetrate the foundation and be mechanically bonded using an approved bonding plate or lug to the structural steel.

L. Grounding for Steel Building Structure:

1. Install a driven ground rod – part of the counterpoise system - at base of each corner column and at intermediate exterior columns at distances not more than 60 feet (18 m) apart.
2. Extend a bonding conductor from the counterpoise system to the structural steel and exothermically weld or connect with an irreversible compression fitting to the hold-down bolts securing the structural steel column to the support footing or foundation.
3. Exothermically weld to connect the counterpoise system to the steel building column.
4. Extend a bonding conductor from the counterpoise system to the structural steel as indicated. Drill and tap a preinstalled, grounding plate welded to the structural steel and secure the bonding conductor to the building steel with a service post.

M. Grounding Bus: Install in electrical equipment rooms, in rooms housing service equipment, and elsewhere as indicated.
1. Install bus horizontally, on insulated spacers 2 inches (50 mm) minimum from wall, 6 inches (150 mm) above finished floor unless otherwise indicated.
2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down to specified height above floor; connect to horizontal bus.
3. Insulate and support grounding bus at intervals not to exceed 2 feet on centers or as indicated.

N. Grounding and Bonding of Metal Underground Water Pipe:
1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes. Use a bolted clamp connector or bolt a lug-type connector to a pipe flange by using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
3. Gas Piping: If installed in, or attached to, a building or structure, bond each aboveground portion of gas piping system downstream from equipment shutoff valve. Metal underground gas piping systems shall NOT be used as a grounding electrode.
4. Metal Process Water Pipes:
   a. For a small or medium-sized pipe, connect the pipe to the ground system at an exposed location using a mechanical bolted clamp connector with silicon bronze hardware.
   b. Follow manufacturer’s instructions for cleaning pipe and applying oxide inhibiting compound around perimeter of connector.

O. Grounding Manholes and Handholes:
1. Install a driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4 inches (100 mm) will extend above finished floor.
2. If necessary, install ground rod before manhole is placed and provide No. 1/0 AWG minimum bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall.
3. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches (50 mm) above to 6 inches (150 mm) below concrete.
4. Seal floor opening with waterproof, non-shrink grout.

P. Grounding Connections to Manhole Components:

1. Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor.
2. Make connections with No. 4 AWG minimum stranded, hard-drawn copper bonding conductor.
3. Train conductors level or plumb around corners and fasten to manhole walls.
4. Connect to cable armor and cable shields according to written instructions by manufacturer of splicing and termination kits.

Q. All grounding system components shall be bonded to form one continuous grounding electrode.
R. Ground electrical service system neutral at service entrance equipment to grounding electrodes.
S. Ground each separately derived system neutral to the main building ground system:
T. Bond the system neutral to service entrance equipment enclosures.
U. Ground all exposed noncurrent carrying metal parts of electrical equipment, metal raceway systems, grounding conductors in raceways and cables, receptacle ground conductors, and metallic plumbing systems.
V. Tighten grounding and bonding connectors and terminals, including screws and bolts, in accordance with manufacturer's published torque tightening values for connectors and bolts. Where manufacturer's torqueing requirements are not indicated, tighten connections to comply with tightening torque values specified in UL 486A to assure permanent and effective grounding.
W. Apply mastic coating to field connections, buried metallic grounding and bonding products, and places where factory applied protective coatings have been destroyed, which are subjected to corrosive action.

3.02 INSTALLATION - EQUIPMENT GROUNDING:

A. Install insulated equipment grounding conductors with all feeders and branch circuits.
B. Terminate feeder and branch circuit insulated equipment grounding conductors with grounding lug on substation, switchgear, switchboard, motor control center, or panelboard ground bus. When conduit enters from below and is not connected to the enclosure, ground equipment grounding conductor on conduit grounding bushing and then bond to ground bus (or grounded enclosure if there is no ground bus).
C. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:
   1. Feeders and branch circuits.
   2. Lighting circuits.
   3. Receptacle circuits.
   4. Single-phase motor and appliance branch circuits.
   5. Three-phase motor and appliance branch circuits.
   6. Flexible raceway and power cords runs.
   7. Busway Supply Circuits: Install insulated equipment grounding conductor from grounding bus in the switchgear, switchboard, or distribution panel to equipment grounding bar terminal on busway.
   8. Computer and Rack-Mounted Electronic Equipment circuits.
D. Ground wireway at least once and at 10-foot intervals.
E. Ground all continuous runs of metallic cable tray and all isolated sections of metallic cable tray at each end. Install NEC sized bare copper equipment ground conductor in all cable tray. Clamp equipment ground conductor to cable tray at 20-foot intervals.
F. Bond cable trays routed parallel to each other with an NEC sized, bare copper tray bonding jumper ground conductor (based on highest ampacity circuit) at 100 foot intervals.

G. Pad-Mounted Transformers and Switches: Install two ground rods and ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Install tinned-copper conductor not less than No. 2 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 6 inches (150 mm) from the foundation.

H. Bonding Interior Metal Ducts: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120V and more, including air cleaners, heaters, blowers, fans, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping. Install tinned copper bonding jumper to bond across flexible duct connections to achieve continuity.

I. Water Heater and Heat-Tracing Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

J. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.

K. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.

L. Signal and Communication Equipment: In addition to grounding and bonding required by NFPA 70, provide a separate grounding system complying with requirements in TIA/ATIS J STD-607-A.

1. For telephone, alarm, voice and data, and other communication equipment, provide No. 4 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.
2. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 1/4- by 4- by 12-inch (6.3- by 100- by 300-mm) grounding bus.
3. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.

M. Metal and Wood Poles Supporting Outdoor Lighting Fixtures: Install a separate grounding conductor with branch-circuit conductors.

N. Ground fence enclosures at each post with Burndy Type GK and GAR connectors. Install flexible braid straps across all hinge points and gates for fence enclosures. Bond fence posts, gates, and fence material to ground where crossed above by a utility line.

O. Bond all motors and equipment to the grounding electrode system with a minimum No. 6 AWG bare copper wire.

P. Bond all motors with “identified” equipment grounding conductor. Route in conduit with phase conductors.

Q. Enclosure Grounds: Bond all enclosures by direct copper connection to the grounding electrode system.

R. Building Grounding Conductors: Support at intervals not to exceed 3 feet on center or as indicated.

3.03 LABELING:

A. Comply with requirements in Section 26 05 53 - Identification for Electrical Systems for instruction signs. The label or its text shall be green.

B. Install labels at the telecommunications bonding conductor and grounding equalizer and at the grounding electrode conductor where exposed.

1. Label Text: "If this connector or cable is loose or if it must be removed for any reason, notify the facility manager."

3.04 INSPECTION:

A. Do not cover up connections before they are inspected by Engineer.

B. Compression-type connections shall be inspected for embossment of proper die index per manufacturer's instructions.

3.05 FIELD QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:

1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
3. All compression-type connections shall be inspected for proper die index number.
4. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, at ground test wells, and at individual ground rods. Make tests at ground rods before any conductors are connected.
    a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
    b. Perform tests by fall-of-potential method according to IEEE 81 for the following:
        (1) Testing and commissioning of new grounds, not yet connected to the utility power supply.
        (2) Testing complex ground systems that include a metallic loop.
    c. A clamp-on ground tester may only be used if the Owner does not require strict adherence to IEEE 81 and for the following situations:
        (1) To test installed grounds without disconnecting them from the utility.
        (2) To test a grounding electrode configuration where the return path includes the earth. (This does not include a ground system that includes a metallic loop.)
        (3) To test the resistance of a single rod in a series or array.
        (4) To check errant current flow to ground for operator safety.
5. Prepare dimensioned Drawings locating each test well, ground rod and ground-rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location, and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.

D. Grounding system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

F. Report measured ground resistances that exceed the following values:
   1. Power and Lighting Equipment or System with Capacity of 500 kVA and Less: 10 ohms.
   2. Power and Lighting Equipment or System with Capacity of 500 to 1,000 kVA: 5 ohms.
   3. Power and Lighting Equipment or System with Capacity More Than 1,000 kVA: 3 ohms.
   4. Power Distribution Units or Panelboards Serving Electronic Equipment: 3 ohm(s).
   5. Substations and Pad-Mounted Equipment: 5 ohms.
   6. Manhole Grounds: 10 ohms.

G. Excessive Ground Resistance: If resistance to ground exceeds specified values, add additional ground rod and retest. If test fails, notify Engineer promptly and include recommendations to reduce ground resistance.

END OF SECTION 26 05 26

SECTION 26 05 33 – RACEWAYS, BOXES, SEALS, AND FITTINGS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies the following:
   1. Conduit.
   2. Wireway.
   3. Outlet and device boxes.
   4. Pull and junction boxes.
   5. Fittings.
   6. Bushings and ground bushings.
   7. Locknuts.
   8. Knockout closures.
   9. Telephone terminal cabinets.
   10. Seal fittings.
   11. Inground pull boxes.
   12. Firestopping and duct seal.
   13. Underground plastic line marker.
   14. Hangers, supports, anchors and accessories.
   15. Grout.
   16. Silicone sealants.

1.03 RELATED REQUIREMENTS:

A. Division 07 – Penetration Firestopping for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.
B. Division 31 – Trenching and Backfilling.
C. Section 26 05 10 – General Electrical.
D. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
E. Section 26 05 43 – Underground Duct Banks and Manholes.
F. Section 26 05 53 – Identification for Electrical Systems.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
B. American National Standards Institute (ANSI):
   1. ANSI C80.1 - Electrical Rigid Steel Conduit (ERSC).
   2. ANSI C80.3 - Electrical Metallic Tubing – Steel (EMT-S).
   3. ANSI C80.5 - Electrical Rigid Metal Conduit – Aluminum (ERMC-A).
   4. ANSI C80.6 - Electrical Intermediate Metal Conduit (EIMC).
C. American Welding Society (AWS):
   1. AWS D1.1/D1.1M - Structural Welding Code - Steel.
D. ASTM International:
   1. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.

2. ASTM A153/A153M. - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
3. ASTM A240/A240M - Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
4. ASTM A780/A780M - Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
5. ASTM B117 -Standard Practice for Operating Salt Spray (Fog) Apparatus.
6. ASTM C1107/C1107M REV A - Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Non-shrink).
7. ASTM B241/B241M - Standard Specification for Aluminum and Aluminum-Alloy Seamless Pipe and Seamless Extruded Tube.
8. ASTM D3917 REV A - Standard Specification for Dimensional Tolerance of Thermosetting Glass-Reinforced Plastic Pultruded Shapes.
9. ASTM D4385 - Standard Practice for Classifying Visual Defects in Thermosetting Reinforced Plastic Pultruded Products.
10. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
11. ASTM E814 - Test Method for Fire Tests of Penetration Firestop Systems.
12. ASTM F2160 - Standard Specification for Solid Wall High Density Polyethylene (HDPE) Conduit Based on Controlled Outside Diameter (OD).

E. Joint Industrial Council (J.I.C.):
1. Comply with standards for Oil and Dust Tight Lay-In Wireway.

F. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code (NEC).

G. National Electrical Contractor's Association (NECA):
1. NECA NEIS 1 - Standard for Good Workmanship in Electrical Construction.

H. National Electrical Manufacturers Association (NEMA):
1. NEMA RN 1 - Polyvinyl-Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit.
2. NEMA TC 2 - Electrical Polyvinyl Chloride (PVC) Conduit.
3. NEMA TC 3 - Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing.
4. NEMA TC 6 and 8 - Polyvinyl Chloride (PVC) Plastic Utilities for Underground Installation.
5. NEMA TC 14.AG - Aboveground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
6. NEMA TC 14.BG - Belowground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
7. NEMA TC 14.XW - Extra Heavy Wall Aboveground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
8. NEMA OS 1 - Sheet-Steel Outlet Boxes, Device Boxes, Covers and Box Supports.
9. NEMA OS 2 - Nonmetallic Outlet Boxes, Covers, and Box Supports.
10. NEMA 250 - Enclosures for Electrical Equipment (1,000V Maximum).

I. Society of Protective Coatings (SSPC):
1. SSPC-PA 1 - Shop, Field and Maintenance Painting of Steel.
2. SSPC-SP3 - Power Tool Cleaning.

J. Underwriters' Laboratories, Inc. (UL):
1. Provide all devices, components, and equipment that are UL listed and labeled.

2. UL 1 - UL Standard for Safety Flexible Metal Conduit.
3. UL 5 - UL Standard for Safety Surface Metal Raceways and Fittings.
4. UL 5C - UL Standard for Safety Surface Raceways and Fittings for Use with Data, Signal, and Control Circuits.
5. UL 6 - UL Standard for Safety Electrical Rigid Metal Conduit – Steel.
6. UL 6A - UL Standard for Safety Electrical Rigid Metal Conduit - Aluminum, Red Brass and Stainless Steel.
7. UL 50 - UL Standard for Safety Enclosures for Electrical Equipment, Non-Environmental Considerations.
8. UL 50E - UL Standard for Safety Enclosures for Electrical Equipment, Environmental Considerations.
9. UL 360 - UL Standard for Safety Liquid-Tight Flexible Metal Conduit.
10. UL 514A - UL Standard for Safety Metallic Outlet Boxes.
11. UL 514B - UL Standard for Safety Conduit, Tubing, and Cable Fittings.
12. UL 514C - UL Standard for Safety Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers.
13. UL 651 - UL Standard for Safety Schedule 40, 80, Type EB and A Rigid PVC Conduit and Fittings.
14. UL 651A - UL Standard for Safety Schedule 40 and 80 High Density Polyethylene (HDPE) Conduit.
15. UL 797 - UL Standard for Safety Electrical Metallic Tubing – Steel.
16. UL 797A - UL Standard for Safety Electrical Metallic Tubing – Aluminum and Stainless Steel.
17. UL 870 - UL Standard for Safety Wireways, Auxiliary Gutters, and Associated Fittings
18. UL 1203 - UL Standard for Safety Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations
19. UL 1242 - UL Standard for Safety Electrical Intermediate Metal Conduit - Steel
20. UL 2515 - UL Standard for Safety Aboveground Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.

1.05 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 - General Electrical Requirements for administrative and procedural requirements for submittals.

B. Submittals shall include, but not be limited to, the following:

1. Product Data:
   a. Submit manufacturer's technical product data, including specifications and installation instructions, for each type of product required. Include data substantiating that materials comply with requirements.
   b. Submit manufacturer's data on supporting devices including catalog cuts, specifications, and installation instructions, for each type of support, anchor, sleeve, and seal.
2. Certifications:
   a. Submit certifications for personnel responsible for installing conduit and fittings with PVC coated jackets.

1.06 QUALITY ASSURANCE:

A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, Structural Welding Code - Steel.

B. Comply with NFPA 70.
C. Installations shall follow standard practices of NECA NEIS 1.
D. Installers of the PVC-coated galvanized rigid conduit system shall be certified by the manufacturer and be able to present a valid, unexpired certified installer card prior to starting installation. All clamping, cutting, threading, bending, and assembly instructions given during the manufacturer's certified installation training shall be followed.

1.07 COORDINATION:
A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified together with concrete specifications.
B. Coordinate installation of roof curbs, equipment supports, and roof penetrations.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:
A. Rigid Steel Conduit and Fittings with Bonded Polyvinyl Chloride (PVC) Jacket:
1. OCAL, Thomas & Betts, ABB Group.
2. Robroy Industries.
B. Rigid Aluminum Conduit:
1. Allied Tube and Conduit, Atkore International.
2. Patriot Aluminum Products
3. Republic Conduit, Tenaris.
4. Wheatland Tube Company, JMC Steel Group.
C. Rigid Aluminum Conduit Fittings:
1. Appleton, Emerson Electric Company.
2. Crouse-Hinds, Eaton.
3. Killark, Division of Hubbell, Inc.
4. Thomas & Betts, ABB Group.
D. Rigid Polyvinyl Chloride (PVC) Conduit and Fittings:
1. Carlon, Thomas & Betts, ABB Group.
2. Cantex Inc.
3. Triangle Conduit and Cable.
E. Wireway:
1. Hoffman, nVent Electric, plc.
2. Schneider Electric.
F. Surface Metal Raceway:
1. Hubbell Wiring Systems.
2. MonoSystems, Inc.
3. Panduit.
4. Wiremold; Legrand.
G. Liquid-Tight Flexible Metal Conduit:
1. AFC Cable Systems, Atkore International.
2. Anaconda.
3. Electri-Flex Company.
4. Southwire Company, LLC.
H. Flexible Metal Conduit:
1. AFC Cable Systems, Atkore International.
2. Southwire Company, LLC.

I. Outlet and Device Boxes:
   1. Appleton, Emerson Electric Company.
   2. Crouse-Hinds, Eaton.
   3. Killark, Division of Hubbell, Inc.
   4. Leviton Manufacturing Company, Inc.
   5. O-Z/Gedney, Emerson Electric Company.
   6. Thomas & Betts, ABB Group.

J. Pull and Junction Boxes:
   1. Metallic Indoor and Outdoor Boxes:
      a. B-Line, Eaton.
      b. Hoffman, nVent Electric, plc.
      c. Wiegmann, Hubbell Inc.

K. Conduit Hubs and Bodies:
   1. Appleton, Emerson Electric Company.
   2. Calbond.
   3. Carlon.
   4. Crouse-Hinds, Eaton.
   5. Ocal, Inc.
   6. O-Z/Gedney, Emerson Electric Company.
   7. Robroy Industries.

L. Wall Entrance Seals:
   1. O.Z./Gedney Model: Type WSK.
   2. O.Z./Gedney Model: Type CSM.

M. Fittings:
   1. Crouse-Hinds, Eaton.
   2. Appleton, Emerson Electric Company.
   3. Thomas & Betts, ABB Group.

N. Bushings, Grounding Bushings, and Locknuts:
   1. Arrow Hart, Eaton.
   2. Appleton, Emerson Electric Company.
   3. O-Z/Gedney, Emerson Electric Company.
   4. Raco, Hubbell, Inc.
   5. Steel City, Thomas & Betts, ABB Group.

O. Electrical Enclosures:
   1. Custom Control Mfr.
   2. Eaton/Cutler-Hammer.
   3. General Electric.
   4. PTMW.

P. Telephone Terminal Cabinets:
   1. Hoffman, nVent Electric, plc.
   2. Schneider Electric.

Q. Anchor Manufacturers: Subject to compliance with requirements, provide anchors of one of the following manufacturers.
   1. Aickinstrut.
   2. Cooper B-line.
   3. Power-Strut.
   4. Robroy.

5. Thomas & Betts.
6. Unistrut, Atkore International.

R. Metal Channel System Manufacturers: Subject to compliance with requirements, provide channel system of one of the following manufacturers.
1. B-line, Eaton
2. Erico, nVent Electric, plc.
3. Kindorf, Thomas & Betts, ABB Group.
4. Power-Strut, Atkore International.
5. Superstrut, Thomas & Betts, ABB Group.
6. Unistrut, Atkore International.

S. Inground Pull Boxes:
1. Hubbell Power Systems.
2. Engineer-approved equal.

T. Firestopping:
1. 3M Company.
2. Engineer-approved equal.

U. Duct Seal:
1. Appleton.
2. Crouse-Hinds.
3. O-Z/Gedney.

V. Underground Type Plastic Line Marker:
1. Brady.
2. Engineer approved equal.

2.02 DESIGN REQUIREMENTS:

A. Conduit:
1. Each length of threaded conduit furnished with coupling on one end and metal or plastic thread protector on other end.
2. UL listed and labeled conduit, on each length, fittings, and accessories.
3. Sizes of conduit, fittings, and accessories as indicated, specified, or as required by Electrical Codes and Standards.

B. Supports:
1. Design supports for multiple raceways capable of supporting combined weight of supported systems and its contents.
2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
3. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of five times the applied force.

2.03 RIGID STEEL CONDUIT AND FITTINGS WITH BONDED POLYVINYL CHLORIDE (PVC) COATING:

A. General:
1. The PVC coated conduit system is specifically designed to prevent corrosive conditions from causing early replacement of the conduit. All the conduit, fittings, and supporting products shall be provided by a single manufacturer.
2. Installers of the PVC-coated galvanized rigid conduit system shall be certified by the manufacturer and be able to present a valid, unexpired certified installer card prior to

starting installation. All clamping, cutting, threading, bending, and assembly instructions given during the manufacturer's certified installation training shall be followed.

B. Raceway:
   1. Conform to hot-dipped galvanized rigid steel conduit as specified in RIGID STEEL CONDUIT, this Section, and as follows. Shall comply with NEMA RN1.
   2. PVC coating bonded to the conduit. Extruded PVC jackets are unacceptable.
   3. Coated externally with PVC to a nominal 40 mils, 0.035 inch to 0.045 inch.
   4. Uniformly coated around outside diameter and full length of the conduit.
   5. Pre-threaded ends coated with a urethane coating having a nominal thickness of 2 mils (0.002 inch).
   6. Interior surfaces of all conduits and feed-through fittings coated (except where prohibited by design) with a two-part, chemically cured, urethane coating having a nominal thickness of 2 mils (0.002 inch).
   7. The bond strength between the metal and coating must exceed the tensile strength of the coating.

C. Couplings, Elbows, and Fittings:
   1. Couplings, elbows, and other conduit fittings, boxes, cover plates, supports, hardware, and related items shall be treated and coated with the same process as conduit.
   2. Each coupling and fitting to include a PVC sleeve that overlaps the conduit.
   3. Length of the overlapping sleeve equals diameter of the conduit or 2 inches, whichever is least.
   4. Final cured PVC coating capable of withstanding a minimum electrical potential of 2,000V.
   5. All conduit accessories, clamps, and hardware that are uncoated shall be stainless steel.
   6. All fittings intended for wet, outdoor, or wash-down application shall carry a NEMA 4X water-tight rating or have an equivalent v-seal design.
   7. Form 8 bodies and covers.

2.04 RIGID ALUMINUM CONDUIT:

A. Raceway:
   1. Fabricated from ASTM B241 alloy GS 10A, identical to Aluminum Association Alloy 6063. Shall meet UL 6A.
   2. All scale, dirt, grease, burrs, and other foreign matter removed prior to applying coating.
   3. Entire length coated with a special silicone lubricating compound compatible with wire and cable coverings to minimize wire drag.
   4. Each length threaded at both ends.
   5. Threads protected with a homogenized zinc dust petroleum lubricating compound to prevent seizure.
   6. Coupling and elbows fabricated from the same material as conduit and each treated as required for conduit.
   7. Couplings may use alloy 3003 in lieu of 6063.

B. Fittings:
   1. Heavy-duty cast, copper-free aluminum (less than 0.4%).
   2. Full threaded hubs.
   3. Rubber-gasketed covers of pressed or cast aluminum.
   4. Cadmium-plated or bronze hardware bolts and screws.
   5. LBD or roller action type LB for right-angle fittings for conduit sizes 2 inches and larger.
   6. Standard and junction fittings.

7. Form 85 or Mark 9 bodies and covers.
8. Conduit Expansion Fittings:
   a. Aluminum expansion fittings for rigid aluminum conduit movement up to 4 inches.
   b. Insulated metal bushing on ends of the conduit, bonding jumper, and with expansion head sealed with a high-grade graphite packing.
   c. O-Z/Gedney, Type AX with Type ABJ bonding jumper or equal.

2.05 RIGID POLYVINYL CHLORIDE (PVC) CONDUIT:

A. Fabricated from self-extinguishing high-impact polyvinyl chloride designed for aboveground and underground installations.
B. Shall meet NEMA TC2, TC6 and TC8, and UL 651.
C. Type EPC Schedule 40 heavy-wall rigid conduit.
D. Fittings and accessories fabricated from same material as conduit. Shall meet NEMA TC3.
E. Solvent-cement-type joints as recommended by manufacturer.

2.06 WIREWAY:

A. General: Provide electrical wireways of types, grades, sizes, and number of channels for each type of service as indicated or required. Provide complete assembly of raceway including, but not limited to, couplings, offsets, elbows, expansion joints, adapters, holddown straps, end caps, and other components and accessories as required for complete system.
B. Lay-in Wireways
   1. NEMA (Rating per enironment requirements) Enclosure. Provide 2-1/2-by 2-1/2-inch, 4- by 4-inch, 6- by 6-inch, 8- by 8-inch and 12- by 12-inch sizes as indicated or required.
   2. NEMA 1 wireways in the 2-1/2-inch, 4-inch and 6-inch sizes shall be provided with knockouts unless indicated otherwise.
   3. Hinged covers, in accordance with UL 870 and with components UL listed, including lengths, connectors, and fittings. Wireways shall allow fastening hinged cover closed without use of parts other than standard lengths, fittings, and connectors.
   4. The 2-1/2-inch, 4-inch and 6-inch wireways shall be constructed with 16-gauge stainless steel. The 8-inch and 12-inch wireways shall be constructed with 14-gauge stainless steel.
   5. Units shall be capable of sealing cover in closed position with screws.
   6. Connectors: Provide wireway connectors suitable for lay-in conductors, with connector covers permanently attached such that removal is not necessary to utilize the lay-in feature.
   7. Finish: Brushed stainless steel.
   8. Protect screws installed toward inside of wireway with spring nuts to prevent wire insulation damage. Use stainless-steel hardware.

2.07 WIRING TROUGHS:

A. Provide electrical wiring troughs of types, grades, sizes, and number of channels for each type of service as indicated or required.
B. NEMA 12 for interior electrical rooms.
C. NEMA 4X stainless steel for all other locations.
D. Provide 2-1/2-by 2-1/2-inch, 4- by 4-inch, 6- by 6-inch, 8- by 8-inch and 12- by 12-inch sizes as indicated or required for application.
E. Hinged covers, in accordance with UL 870 and with components UL listed.
F. Wiring trough covers and bodies shall be constructed with 14-gauge stainless steel minimum.

G. Shall not include holes or knockouts.
H. Units shall be capable of sealing cover in closed position with screws or screw clamps.
I. Finish: Painted sheet metal parts shall have rust-inhibiting coating and baked enamel finish.
J. Use stainless-steel hardware.

2.08 SURFACE METAL RACEWAYS:

A. Surface Metal Raceways shall comply with UL 5 and UL 5C and be UL labeled.
   1. Type 1 Raceway: Multi-outlet assembly for prewired outlets, lengths as indicated. Provide 3-wire, single circuit with outlets on 18-inch centers. Provide green insulated ground as third wire.
   2. Type 2 Raceway: Multi-outlet assembly for prewired outlets, lengths as indicated. Provide 4-wire, double circuit with outlets on 18-inch centers. Provide green insulated ground as fourth wire.
   3. Type 3 Raceway: Two-piece type with single compartment, lengths as indicated. Provide nominal 2-3/4 inch by 1-7/16 inch with flush, snap-on cover. Install devices as indicated in raceway.
   4. Type 4 Raceway: Two-piece type, divided for power and communication use, lengths as indicated. Provide nominal 4-3/4 inch by 1-3/4 inch with two 2-3/8-inch compartments.
   5. Type 5 Raceway: Surface-mounted type for power use, lengths as indicated. Provide nominal 3/4 inch wide, depth as required, single-piece type.
   6. Type 6 Raceway: Two-piece type with single compartment, length as indicated. Provide nominal 4-3/4 inch by 3-9/16 inch with flush, snap-on cover. Install devices as indicated in raceway.
   7. Boxes for Surface Raceways: Designed, manufactured, and supplied by raceway manufacturer for use with specified raceway.

2.09 LIQUID-TIGHT FLEXIBLE METAL CONDUIT:

A. Liquid-tight conduit with flexible aluminum core and a synthetic rubber, polyvinyl chloride, or thermoplastic covering.
B. Shall comply with UL 360.
C. Spiral encased copper bonding conductors for conduit in sizes 1-1/4 inches and smaller.
D. External grounding jumper as required.
E. Provide hot-dipped galvanized fittings for connections to rigid steel conduit, and aluminum- or PVC-coated fittings for connections to aluminum and PVC-coated rigid steel conduit.
F. Fittings for liquid-tight flexible metal conduit shall comply with UL 514B.

2.10 OUTLET AND DEVICE BOXES:

A. Surface Mounted:
   1. Cast hub device boxes for receptacles and switches.
   2. Cast aluminum. Metallic boxes shall meet UL 514A and NEMA OS 1.
   3. PVC boxes for PVC conduit. PVC boxes shall meet UL 514C and NEMA OS 2.
   4. FS or FD single boxes as required.
   5. Outlet boxes intended for use in classified areas shall be UL 886 listed.
B. Flush Mounted in Plaster Walls:
   1. Stainless sheet-steel nongangable device boxes.
   2. Conduit knockout openings in bottom and sides.
   3. Threaded screw holes for fastening devices and box covers.
   4. Corrosion-resistant screws for equipment grounding.

5. Include mounting brackets, device extensions plaster ears, and plaster board expandable grip fasteners (for existing plaster walls) compatible with box.
6. Shall meet UL 514A and NEMA OS 1.

2.11 PULL AND JUNCTION BOXES:

A. Stainless Steel Boxes – Indoor and Outdoor:
1. Type 316 stainless steel with stainless-steel cover and stainless-steel clamps and screws. Minimum 16 gauge for boxes with no dimension exceeding 6 inches and minimum 14 gauge for all other boxes.
2. Continuously welded seams shall be ground for a smooth finish.
3. Seamless gasket for cover.
4. Conform to NEMA Type 4X.
5. Provide continuous hinge, gasketed cover, and interior mounting plate when used for enclosing terminal blocks and control relays.
6. Provide rigid weatherproof conduit hubs for all boxes.

B. Rigid Aluminum Conduit Boxes – Indoor and Outdoor:
1. For use with aluminum raceway systems.
2. Self-oxidizing, self-renewing aluminum alloy that is "copper-free" - less than 0.3 of 1% to assure resistance to corrosion, with a minimum wall thickness of 3/32 inch.
3. Threaded conduit entrance with thread lubricant.
4. Thoroughly cleaned to eliminate grease and other contaminates.
5. Rubber or neoprene gasket for cover.
6. Conform to NEMA Type 4X enclosures in all outdoor installations and process areas unless indicated otherwise.
7. Conform to NEMA Type 12 for indoor electrical rooms and similar conditioned spaces.
8. Interior mounting panel when used for enclosing terminal blocks and control relays.
9. Box size as required by NEC or as indicated for each particular installation.
10. Include provisions for mounting cable supports as indicated, specified or as required by NEC.
11. Provide where indicated for cable pulling, junctions, terminals and for mounting of switches, outlets, and control devices.

C. Metallic Barriers:
1. Designed not to separate phases of a power circuit.
2. Provide as indicated for the isolation of power circuits from other type circuits

D. Bushings: Provide threaded, nylon-insulated metallic bushings. Provide steel bushings for conduit sizes 1-1/2 inches and smaller. Provide malleable iron bushings for conduit sizes 2 inches and larger.

E. Grounding Bushings: Provided where required by NEC. Provide threaded, insulated, malleable iron bushing with lay-in screw clamp lug.

F. Locknuts: Provide locknuts for conduit sizes 2 inches and smaller. Provide malleable aluminum for conduit sizes 2.5 inches and larger. Locknut material shall match conduit type.

G. Sealing Hub: Provide watertight, threaded, insulated sealing hub connectors for all outdoor and indoor wet locations where conduit enters into enclosures. Sealing hub threaded lengths shall be adequate to allow installation of bushing.

H. Knockout Closures: Provide steel press-in knockout seals for all unused punched out knockouts 2 inches and smaller. Provide metal two-piece bolt on knockout seals for all unused punched out knockouts 2-1/2 inches and larger.

I. Compression Fittings: Provide all threaded nipples, insulated short elbows, offset nipples, offset connectors, enlargers and reducers as required.

J. Telephone Terminal Cabinets: Provide telephone terminal cabinets of sizes indicated, constructed of code gauge steel painted gray, concealed hinge door, keyed flush lock (all locks shall be keyed identically, provide one key per lock) and with 3/4-inch plywood backing. Plywood backing shall be finished with black paint.

K. Hinged-Cover Enclosures:
1. Comply with UL 50 and NEMA 250, Type 12 for indoor and Type 4X stainless steel for outdoor.
2. Provide with continuous-hinge cover with flush latch unless otherwise indicated.
3. Metal Enclosures: Stainless-Steel.
4. Metal barriers to separate wiring of different systems and voltage.
5. Gasketed enclosures shall meet UL 50E.

2.12 CONDUIT WALL ENTRANCE SEALS:

A. Provide where required or indicated.
B. Use O-Z/Gedney Type FSK for new walls.
C. Use O-Z/Gedney Type CSM for penetration in existing walls.

2.13 SEAL FITTINGS AND COUPLINGS FOR RIGID STEEL, ALUMINUM AND PVC-COATED RIGID STEEL CONDUIT:

A. Fittings:
1. Cast aluminum, copper free fittings for aluminum conduit.
2. PVC coated where PVC-coated conduit is used.
3. Explosionproof.
4. Threaded cover to conform to NEC.
5. Full thread hubs.
6. Seal Fittings:
a. Shall be designed to allow for 40% cable fill.
b. Provide sealing compound (“Chico”) and packing fiber for all sealing fittings.
c. Provide with seal drains where required to provide a continuous automatic drain of water.

B. Couplings:
1. Explosionproof.
2. Flexible.
3. Conform to NEC.
4. Threaded aluminum end fittings securely fastened to the core and braided to ensure electrical continuity.
5. PVC coated in corrosive areas where PVC-coated conduit is used.

2.14 STAINLESS STEEL SUPPORT SYSTEM:

A. General: Provide supporting devices which comply with manufacturer's standard materials, design, and construction in accordance with published product information, as required for complete installation, and as herein specified. All supports shall be designed for the support of the maximum number of conduits and their maximum conductor weights for maximum conduit loading. Where more than one type of supporting device meets indicated requirements, selection is Contractor's option. Do not use perforated metal straps for supports.

B. Fabricated from structural steel or manufactured framing members equal to "Unistrut" P-3000 (1-5/8 inch by 1-3/8 inch) series as manufactured by Unistrut Corporation, Kindorf B-995 (11/2 inch by 1-1/2 inch) series as manufactured by Thomas and Betts, or Superstrut A-1200 (1-5/8 inch by 1-5/8 inch) series as manufactured by Thomas and Betts.
C. Minimum 12 gauge.
D. Construct as required to rigidly support all conduit runs, boxes, and equipment.
E. Post bases shall include four (4) mounting holes for anchors and two (2) holes for channel-mount.
F. Stainless-Steel Supports:
   1. Channel Type 304 stainless steel conforming to ASTM A240.
   2. Stainless-steel conduit clamps and hangers, sized for the specific conduit diameter.
   3. Provide stainless-steel rods, anchors, inserts, bolts, washers, nuts, and support hardware.
G. Anchors: Anchors of types, sizes, and materials indicated, with the following construction features.
   1. Stainless-steel Expansion Anchors: 1/2, 5/8, or 3/4 inch as required.
   2. Toggle Bolts: Springhead, 3/16 by 4 inch or larger size as required.

2.15 INGROUND PULL BOXES:

A. Boxes and cover shall be made of polymer concrete.
B. Material shall be sunlight resistant, chemical resistant, moisture resistant, and non-conductive.
C. The boxes shall be stable type for extra depth.
D. The covers shall be heavy-duty and designed for 15,000 pounds over a 10-inch square with a minimum test load of 22,000 lbs. The covers shall be made of non-skid materials.
E. Shall be designed for outdoor inground installation.
F. Size shall be as required by the National Electrical Code. Minimum size shall be 12 inches wide by 24 inches deep by 12 inches high.
G. All mounting hardware shall be 316 stainless steel.
H. Install where indicated and required.

2.16 FIRESTOPPING AND DUCT SEAL:

A. Firestopping:
   1. Weather-resistant silicone sealant.
   2. Provide 4-hour fire rating.
   3. Provide flexible re-enterable and repairable seal around conduit.
   4. ASTM E814 tested system.
   5. Provide 3M® Fire Barrier 2000+ Silicone Sealant or Engineer-approved equal.
B. Duct Seal:
   1. Noncorrosive, permanently soft compound.
   2. Nontoxic.
   3. Provide flexible re-enterable and repairable seal around cables in conduits.
   4. Prevent air movement and drafts through conduits.
   5. Provide Ideal Industries Duct Seal, 3M® Moldable Putty, or Engineer-approved equal.

2.17 UNDERGROUND PLASTIC LINE MARKER:

A. Permanent, traceable, bright-colored, continuous-printed plastic tape marker, intended for marking below grade utilities.
B. Provide tape marker with printing which most accurately indicates type of utility such as “Fiber Optic Cable Below” or “Electric Below.”

C. Provide with continuous metal strip or core to allow nonmetallic conduits or fiber optic cables to be located.
D. Manufactured by Brady or Engineer-approved equal.

2.18 GROUT:
A. Description: Non-shrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.
B. Standard: ASTM C1107/C1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
C. Design Mix: 5,000-psi (34.5-MPa), 28-day compressive strength.
D. Packaging: Premixed and factory packaged.

2.19 SILICONE SEALANTS:
A. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below.
1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.
B. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, non-shrinking foam.

PART 3 - EXECUTION

3.01 PREPARATION:
A. Provide suitable protection for conduit risers against damage during construction.
B. Cap ends of all conduits before concrete is poured.
C. Cap all conduits after cleaning where conduits are to be left empty by this Contract.
D. Carefully ream ends of all conduit lengths after cutting to eliminate sharp burrs.
E. Clean out all conduits before pulling wire.
F. Clean out all conduits immediately after concrete work is finished.

3.02 RACEWAYS AND BOX INSTALLATION:
A. General Requirements:
1. Location:
a. Install conduit as near as possible to the routing indicated.
b. Shift locations as required to avoid interference with other equipment and piping being installed.
c. Where routing of conduit is not indicated, such as for lighting home run circuits and other systems requiring small conduit runs, route conduit as specified subject to approval by Engineer.
2. Do not use conduit in sizes smaller than 3/4 inch, except 1/2 inch may be used for connections to control devices and thermocouples where necessary.
3. Holes and Sleeves:
a. Provide through floors, walls, and roofs as necessary for conduit runs, including approved flashing and weather proofing at outside walls and on roofs.
b. Install sleeves or forms for all openings in new Work.
c. Provide the required inserts and holes, completely sleeved, bonded, curbed, flashed, and finished off in an approved manner, whether in concrete, steel grating, metal panels, or roofs.

d. Core-drill all holes required in existing building work using a dustless method.
e. Place non-shrinking grout or Dow Corning 3-6548 Silicone RTV or equivalent General Electric RTF 762 sealant as specified, in the following locations:
   (1) All holes in concrete, walls, floor, and roof slabs after installation of conduit.
   (2) All unused holes and sleeves as approved by Engineer.
f. Install wall entrance seals where conduit enters the building or vaults from exterior underground.

4. Install firestopping at all conduit penetration of fire-rated walls, ceilings, and floors. Firestopping system shall equal or exceed fire rating of wall, ceiling, or floor in which it is installed. Install duct seal in conduits around cables at all conduit terminations at control panels and boxes containing terminations and splices.
5. Make connections to boxes, panels, and other equipment as follows:
   a. Indoor Dry Locations: Double locknuts, one inside and one outside.
   b. Outdoor and Damp Locations: Rigid weatherproof conduit hubs.
   c. Bushings:
      (1) Threaded malleable metal.
      (2) Insulated with Bakelite, molded and bonded into the bushing.
      (3) Placed on end of conduit in addition to locknuts.
      (4) Install with integral grounding connector and conductor where all conduits pass through multiple concentric panel knockouts and where the conduit must be bonded to equipment it is not attached to.
6. Running threads will not be permitted.
7. Coat all field cut threads in galvanized conduit with cold galvanizing paint.
8. Comply with applicable requirements of NEC pertaining to installation of conduit systems.
9. Place drainage fittings or weep holes at unavoidable low points where moisture can collect.
10. Install an entire conduit system that is electrically continuous with bonding jumpers provided as necessary to conform to NEC.
11. Install expansion fittings at all building expansion joints and every 100 feet of continuous conduit.

B. PVC-Coated Rigid Steel Conduit:
1. Install at 90 degree sweeps from below grade to above grade.
2. Installers of PVC Coated Conduit must be certified by the manufacturer and be able to present a valid, unexpired Certified installer card prior to installation of conduit system.
3. Coat field cut threads with manufacturer's standard product in accordance with manufacturer's recommendations.
4. Use bender one size larger for conduit sized 1 inch or less and conventional bender for conduit sized above 1 inch.
5. Use strap wrench to tighten conduit. Repair damaged coating with liquid patching compound recommended by conduit manufacturer.
6. Buried:
   a. Bury conduits a minimum of 36 inches below finish grade unless indicated otherwise.
   b. Slope conduit away from conduit risers where possible.
   c. Maintain 6-inch separation from underground piping.
   d. Use long radius elbows for all feeders unless indicated otherwise.
   e. Use for conduit risers where routed through concrete slabs.

f. After trench bottom has been finished to grade, lay conduit. Backfilling shall be as specified in Division 31.
g. Cap ends of all conduit risers before backfilling.

C. Rigid Aluminum Conduit:
1. Install at interior and exposed locations,
2. Do not install underground or cast in concrete.
3. Use anti-seize compound on conduit threads.
4. Use bender one size larger than nominal up through 1 inch and conventional size bender for conduit over 1 inch in size.
5. Exposed:
a. Group parallel runs in neatly aligned banks where possible with a minimum of 1-inch clearance between conduits.
b. Run conduit parallel or perpendicular to walls, ceiling, beams, and columns unless indicated otherwise.
c. Route to clear all doors, windows, access walls, and openings.
d. Maintain 6-inch clearance between conduit and coverings on all hot lines; steam, hot water, and similar pipes.
e. Do not exceed a distance of 8 feet between supports on horizontal or vertical runs.
f. Install horizontal runs as high above floor as possible, and in no case lower than 7 feet above floor, walkway, or platform in passage area.
g. When terminating at cable tray, firmly attach conduit to tray and electrically bond conduit with ground wire to cable tray.
6. Concealed:
a. Conceal conduit for lighting, convenience outlets, and other circuits for finished office spaces in walls and above suspended ceiling where possible.
7. For short runs, the use of flat steel tapes is prohibited. Polyethylene fish tapes and round, flexible, speedometer-type steel cables are recommended.

D. Non-concrete Encased Rigid PVC Conduit:
1. Install below grade. Non-concrete encased.
2. Make all joints watertight with cement compound furnished by the conduit manufacturer.
3. Buried:
a. Install in as straight a run as possible between termination points of exact routing to be determined in the field and subject to approval by Engineer.
b. Bury conduits a minimum of 36 inches below finish grade unless indicated otherwise.
c. Slope conduit away from conduit risers where possible.
d. Maintain 6-inch separation from underground piping.
e. Use PVC-coated rigid steel elbows at all risers and at any bend greater than 45 degrees unless indicated otherwise.
f. Use long radius elbows for all primary feeders unless indicated otherwise.
g. All risers shall be PVC-coated rigid steel conduit.
h. After trench bottom has been finished to grade, lay conduit. Backfilling shall be as specified in Division 31.
i. Cap ends of all conduit risers before backfilling.

E. Liquid-Tight Flexible Metal Conduit.
1. Use between rigid conduit and motor terminal boxes except where conduit runs down from above and cannot be conveniently supported by a floor flange.

2. Place between rigid conduit or conduit box and control device cases where direct connection is not desirable for reasons of equipment movement, vibration, or for ease of maintenance.
3. Install at all points of connection to equipment mounted on supports to allow for expansion and contraction.
4. Conform to NEC with installation of conductors.
5. Install at locations where rigid conduit connections are impractical.
6. Use minimum length consistent with manufacturer's standard lengths, the acceptable bending radius, and with required movement of equipment.
7. Maximum length of 3 feet unless otherwise approved by Engineer.
8. Install an external bonding jumper to conform to NEC on conduit sized 1-1/2 inches and larger.

F. Flexible Metal Conduit:
1. Use for installation of luminaires only.
2. Do not use with vapor-tight fixtures. Use in accordance with the National Electrical Code Article 350.
3. Use minimum length consistent with manufacturer's standard lengths and acceptable bending radius.
4. Maximum length of 3 feet unless otherwise approved by Engineer.

G. Compression Conduit Fittings:
1. Installations of special fittings are indicated.
2. Use aluminum fittings for joining aluminum to steel conduit.
3. Install as required.

3.03 SURFACE METAL RACEWAYS AND WIREWAYS:

A. Mechanically assemble metal enclosures and surface metal raceways for conductors to form continuous electrical conductor, and connect to electrical boxes, fittings, and cabinets to provide effective electrical continuity and rigid mechanical assembly.
B. Provide only where indicated. Avoid use of dissimilar metals throughout system to eliminate possibility of galvanic corrosion. Where dissimilar metals are in contact, coat all surfaces with corrosion-inhibiting compound before assembling.
C. Install expansion fittings in all raceways, surface metal raceways, and wireways wherever structural expansion joints are crossed.
D. Make changes in direction of surface metal raceway and wireway with proper fittings supplied by raceway manufacturer. No field bends of surface metal raceway or wireway sections will be permitted.
E. Properly support and anchor surface metal raceways for their entire length with structural materials. Surface metal raceways are not to span any space unsupported.
F. Use boxes as supplied by surface metal raceway manufacturer wherever junction, pull or devices boxes are required. Standard electrical "handy" boxes, etc., shall not be permitted for use with surface metal raceway installations.
G. Provide identification of all raceways as specified in Section 26 05 53 - Identification for Electrical Systems.
H. Provide tap location nameplates for wireways when used as auxiliary gutters as specified in Section 26 05 53 - Indetification for Electrical Systems.
I. Ground wireways at 10-foot intervals per Section 26 05 26 - Grounding and Bonding for Electrical Systems.

3.04 BOXES AND FITTINGS:

A. Install electrical boxes, bushings, locknuts, nipples, connectors, sealing hubs, and fittings as required, indicated, in accordance with applicable requirements of NEC and in accordance with recognized industry practices to fulfill Project requirements.
B. Coordinate installation of electrical boxes and fittings with wire/cable, wiring devices, and raceway installation work.
C. Provide weatherproof boxes for interior and exterior locations exposed to weather or moisture.
D. All boxes containing emergency power and lighting circuits shall be identified as specified in Section 26 05 53 - Identification for Electrical Systems.
E. Provide (oil-tight) knockout closures to cap unused knockout holes where blanks have been removed.
F. Install electrical boxes in only those locations which ensure ready accessibility to enclosed electrical wiring.
G. Maximum box size in a fire-rated wall shall be 4 inches by 4 inches square. Do not install boxes back-to-back in walls. In walls that are not fire-rated or acoustic- rated, provide not less than 6 inches (150 mm) horizontal separation between boxes installed in opposite sides of wall. Provide not less than 24 inches (610 mm) horizontal separation between boxes installed in opposite sides of fire-rated and acoustic-rated walls.
H. Do not install aluminum products in concrete.
I. Position recessed outlet boxes accurately to allow for surface finish thickness.
J. Set floor boxes level and flush with finish flooring material.
K. Fasten electrical boxes firmly and rigidly to the surfaces to which attached, structural surfaces to which attached, or solidly embed them in concrete or masonry.
L. Provide electrical connections for installed boxes.
M. Properly ground metallic electrical boxes in compliance with the NEC. Bond all non-isolated equipment grounding conductors to all electrical boxes.
N. Subsequent to installation of boxes, protect boxes from construction debris and damage.
O. Install special boxes as indicated of size required for conduits and cables entering and leaving box.
P. Explosionproof Fittings:
    1. Install explosionproof fittings in the conduit system as required by NEC.
    2. Install necessary fittings where not indicated but required by code.

3.05 SUPPORTS:

A. Construct with sufficient rigidity to hold all mounted equipment and material in permanent and neat alignment.
B. Design to provide 1/4-inch space between equipment housings and walls or columns upon which they are mounted.
C. Do not exceed load requirements in NEC and NEMA standards.
D. Use aluminum supports, clamps, and straps to support aluminum conduit.
E. Use stainless-steel conduit straps to support PVC-coated rigid steel conduit. Use stainless-steel clamps for supporting PVC coated rigid steel conduit on stainless-steel supports.
F. Use nonmagnetic conduit clamps to support nonmagnetic conduit.

3.06 CONCRETE BASES:

A. Construct concrete bases of dimensions indicated but not less than 4 inches (100 mm) larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

B. Use 3,000-psi (20.7-MPa), 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 - Concrete.
C. Anchor equipment to concrete base.
   1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   2. Install anchor bolts to elevations required for proper attachment to supported equipment.
   3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.07 INGROUND PULL BOXES:
A. Install a minimum of 6 inches of compacted granular material below pull box.
B. Install top of pull box flush with finished grade.
C. Bring conduit up from below box or make conduit penetration in boxes per manufacturer's recommendations.

3.08 SEAL FITTINGS:
A. Install seal fittings in the rigid steel or aluminum conduit system as required by NEC.
B. Install necessary fittings where not indicated but required by code.

3.09 UNDERGROUND PLASTIC LINE MARKER:
A. Install underground traceable line marker 12-inches below grade above all conduits.

3.10 PAINTING:
A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils (0.05 mm).

END OF SECTION 26 05 33

SECTION 26 05 36 - CABLE TRAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes:
   1. Ladder cable trays.
   2. Basket cable trays.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
B. Section 26 05 53 – Identification for Electrical Systems.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.

A. American National Standards Institute (ANSI):
   1. ANSI H35.1/H35.1M - Alloy and Temper Designation Systems for Aluminum.

B. American Society of Civil Engineers/Structural Engineering Institute.
   1. ASCE/SEI 7 - Minimum Design Loads for Buildings and Other Structures.

C. ASTM International:
   1. ASTM A123/A123M - Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   2. ASTM A510/A510M - Standard Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel.
   3. ASTM A653/A653M - Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   4. ASTM A1008/A1008M - Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
   5. ASTM A1011/A1011M - Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
   6. ASTM B633 - Specification for Electrodeposited Coatings of Zinc on Iron and Steel.
   7. ASTM D769 - Specification for Black Synthetic Iron Oxide.
   8. ASTM F593: Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs.
   9. ASTM F594 - Specification for Stainless Steel Nuts.
   10. ASTM F1136 - Specification for Zinc/Aluminum Corrosion Protective Coatings for Fasteners.

D. National Electrical Manufacturers Association:
   1. NEMA VE 1 - Metal Cable Tray Systems.
   2. NEMA VE 2 - Cable Tray Installation Guidelines.

E. National Fire Protection Association (NFPA):
   1. NFPA 70 – National Electrical Code (NEC).

1.05 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

B. Product Data: For each type of product.

1. Include data indicating dimensions and finishes for each type of cable tray indicated.

C. Shop Drawings: For each type of cable tray.

1. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.

D. Seismic Qualification Certificates: Submit certification that switchboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 26 05 48 – Vibration and Seismic Controls for Electrical Systems.

1.06 WARRANTY

A. The equipment Manufacturer shall warrant that all equipment shall be free from defects caused by faulty material or workmanship for a minimum period of two (2) years from the date of Substantial Completion, unless otherwise specified.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Ladder Cable Tray:

1. B-Line, Eaton.
2. Chalfant Manufacturing Company.
3. PW Industries, Legrand.
4. MP Husky.

B. Basket Cable Tray:

1. B-Line, Eaton.
2. Cablofil, Legrand.
3. Chalfant Manufacturing Company.
4. Cope, Unistrut.
5. MP Husky.

2.02 GENERAL REQUIREMENTS FOR CABLE TRAYS:

A. Cable Trays and Accessories: Identified as defined in NFPA 70 and marked for intended location, application, and grounding.

1. Source Limitations: Obtain cable trays and components from single manufacturer.

B. Sizes and Configurations: See the Cable Tray Schedule on Contract Drawings for specific requirements for types, materials, sizes, and configurations.

C. Structural Performance: See articles on individual cable tray types for specific values for the following parameters:

1. Uniform Load Distribution: Capable of supporting a uniformly distributed load on the indicated support span when supported as a simple span and tested according to NEMA VE 1.
2. Load and Safety Factors: Applicable to both side rails and rung capacities.

2.03 LADDER CABLE TRAYS:

A. Description:

1. Aluminum Tray.
2. Configuration: Two I-beam side rails with transverse rungs welded to side rails.
3. Rung Spacing: 9 inches
4. Radius-Fitting Rung Spacing: 9 inches at center of tray's width.
5. Structural Performance of Each Rung: Capable of supporting a maximum cable load, with a safety factor of 1.5, plus a 200-lb (90-kg) concentrated load, when tested according to NEMA VE 1.
6. Straight Section Lengths: 20 feet except where shorter lengths are required to facilitate tray assembly.
7. Depth and Width: Refer to Contract Drawings.
8. Fitting Minimum Radius: 12 inches.
9. Class Designation: Comply with NEMA VE 1, Class 20C.
10. Splicing Assemblies: Bolted type using serrated flange locknuts.
11. Hardware and Fasteners: ASTM F593 and ASTM F594 stainless steel, Type 316.
12. Splice Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

2.04 BASKET CABLE TRAYS:

A. Provide wire basket cable tray of types and sizes indicated with connector assemblies, clamp assemblies, connector plates, splice plates and splice bars. Construct units with rounded edges and smooth surfaces; in compliance with applicable standards.
B. All straight section longitudinal wires shall be constructed with a continuous top wire safety edge. Safety edge must be kinked and T-welded on all tray sizes.
C. Wire basket cable tray shall be made of high strength aluminum wires and formed into a standard 2 inch by 4 inch wire mesh pattern with intersecting wires welded together. All mesh sections must have at least one bottom longitudinal wire along entire length of straight section.
D. Wire mesh cable tray fittings shall be field fabricated from straight tray sections, in accordance with manufacturer instructions.
E. Shall be constructed of aluminum.
F. Basket cable tray shall consist of continuous, rigid, welded steel wire mesh cable management system, to allow continuous ventilation of cables and maximum dissipation of heat.
G. Basket cable tray shall be grounded using UL Listed splicing methods per manufacturer recommendations.
H. UL Classified splices where tray acts as Equipment Grounding Conductor (EGC). Wire mesh cable tray will have continuous welded top side wire to protect cable insulation from being damaged.
I. Basket cable tray supports and mounting hardware shall be hot dipped galvanized. Support locations and mounting hardware shall be per manufacturer recommendations.
J. Wire basket sizes shall conform to widths and usable depths as indicated on the Drawings. Where specific dimensions are not called out, cable tray shall be sized for all cables designed to be in cable tray plus 20%.

2.05 CABLE TRAY ACCESSORIES:

A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as cable tray.
B. Barrier Strips: Same materials and finishes as for cable tray.
C. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

2.06 WARNING SIGNS:

A. Lettering: 1-1/2-inch high, black letters on yellow background with legend "Warning! Not To Be Used as Walkway, Ladder, or Support for Ladders or Personnel."

B. Comply with requirements in Section 26 05 53 –Electrical Identification.

2.07 SOURCE QUALITY CONTROL:

A. Testing: Test and inspect cable trays according to NEMA VE 1.

PART 3 - EXECUTION

3.01 CABLE TRAY INSTALLATION:

A. Install cable trays according to NEMA VE 2 and TIA/EIA-560-A-7.

B. Install cable trays as a complete system, including fasteners, hold-down clips, support systems, barrier strips, adjustable horizontal and vertical splice plates, elbows, reducers, tees, crosses, cable dropouts, adapters, covers, and bonding.

C. Install cable trays so that the tray is accessible for cable installation and all splices are accessible for inspection and adjustment.

D. Remove burrs and sharp edges from cable trays.

E. Join aluminum cable tray with splice plates; use four square-neck carriage bolts and locknuts.

F. Fasten cable tray supports to building structure and steel supports as shown on Contract Drawings.

G. Place supports so that spans do not exceed maximum spans on schedules and provide clearances shown on Drawings. Install intermediate supports when cable weight exceeds the load-carrying capacity of the tray rungs.

H. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.

I. Locate and install supports according to NEMA VE 2. Do not install more than one cable tray splice between supports.

J. Make changes in direction and elevation using manufacturer's recommended fittings.

K. Make cable tray connections using manufacturer's recommended fittings.

L. Basket Cable Tray:

1. Cutting: Field-fabricate changes in direction & elevation by cutting & bending cable tray.
2. Cut cable tray wires in accordance with manufacturer's instructions.
3. Cable tray wires must be cut with side-action bolt cutters with offset head to ensure integrity of protective galvanic layer.
4. Remove burrs and sharp edges from cable trays.
5. Installers shall have completed the manufacturer certified installation training prior to installation.

M. Install all 600V power and control cables in power cable trays. Install all shielded analog cables, 24V discrete signal cables, data and communications in the instrumentation tray.

N. Install warning signs in visible locations on or near cable trays after cable tray installation.

3.02 CABLE TRAY GROUNDING:

A. Ground cable trays according to NFPA 70 unless additional grounding is specified. Comply with requirements in Section 26 05 26 – Grounding and Bonding for Electrical Systems.

B. Cable trays with electrical power conductors shall be bonded together with splice plates UL listed for grounding purposes or with UL listed bonding jumpers.

C. All grounding clamps shall be UL listed.

3.03 CABLE INSTALLATION:

A. Install cables only when each cable tray run has been completed and inspected.
B. Fasten cables on horizontal runs with cable clamps or cable ties according to NEMA VE 2. Tighten clamps only enough to secure the cable, without indenting the cable jacket. Install cable ties with a tool that includes an automatic pressure-limiting device.
C. Fasten cables on vertical runs to cable trays every 18 inches.

3.04 CONNECTIONS:

A. Connect raceways to cable trays according to requirements in NEMA VE 2.
B. Install UL listed conduit clamps for all conduit connections to cable tray.

3.05 FIELD QUALITY CONTROL:

A. Perform the following tests and inspections:
    1. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements.
    2. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.
    3. Verify that the number, size, and voltage of cables in cable trays do not exceed that permitted by NFPA 70. Verify that communications or data-processing circuits are installed in separate cable trays from power circuits.
    4. Verify that there are no intruding items such as pipes, hangers, or other equipment in the cable tray.
    5. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.
    6. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.
    7. Check for improperly sized or installed bonding jumpers.
    8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.
    9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 ohm.
B. Prepare test and inspection reports.

3.06 PROTECTION:

A. Protect installed cable trays and cables.
    1. Install temporary protection for cables in open trays to safeguard exposed cables against falling objects or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials and shall remain in place until the risk of damage is over.
    2. Repair damage to galvanized finishes with zinc-rich coating.
    3. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.

END OF SECTION 26 05 36

SECTION 26 05 43 – UNDERGROUND DUCT BANKS AND HANDHOLES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes the following:
   1. Complete underground duct systems consisting of banks of nonmetallic ducts encased in reinforced concrete, and precast concrete handholes and manholes.
   2. All necessary earth and rock excavation and backfill.
   3. Removal and disposal of all excess excavation material.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
B. Section 26 05 33 – Raceways, Boxes, Seals, and Fittings for Electrical Systems.
C. Earthwork: Division 31.
D. Concrete: Division 03.

1.04 REFERENCE STANDARDS:

A. American Concrete Institute (ACI):
   1. 318-14 – Building Code Requirements for Structural Concrete.
B. American Society for Testing and Materials (ASTM):
   1. ASTM A48 – Standard Specification for Gray Iron Castings.
   2. ASTM C857 – Minimum Structural Design Loading for Underground Precast Concrete Utility Structures.
   3. ASTM C858 – Standard Specification for Underground Precast Concrete Utility Structures.
   4. ASTM C979/C979M – Pigments for Integrally Colored Concrete.
   5. ASTM D4385 – Practice for Classifying Visual Defects in Thermosetting Reinforced Plastic Pultruded Products.
   6. ASTM F512 – Standard Specification for Smooth Wall Polyvinyl Chloride (PVC) Conduit and Fittings for Underground Installation.
   7. F2160 – Standard Specification for Soldi Wall High Density Polyethylene (HDPE) Conduit Based on Controlled Outside Diameter (OD).
C. Federal Specifications:
   1. W-C-1094A – Conduit and Conduit Fittings Plastic, Rigid.
D. National Electrical Manufacturer's Association (NEMA):
   1. NEMA TC 2 – Electrical Polyvinyl Chloride (PVC) Conduit.
   2. NEMA TC 3 – Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing.
   3. NEMA TC 6 – PVC and ABS Plastic Utilities Duct for Underground Installation.
   4. NEMA TC 8 – Extra Strength PVC Plastic Utilities Duct for Underground Installation.
   5. NEMA TC-14 – Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
   6. TCB 4 - Guidelines for the Selection and Installation of Smooth-Wall Coilable High-Density Polyethylene (HDPE) Conduit for Trench Installation.
E. Underwriters Laboratories, Inc. (UL):
   1. UL 651 – Schedules 40, 80, Type EB and A Rigid PVC Conduit and Fittings
   2. UL 1684 – Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.

1.05 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

B. Product Data: Submit the following for each type of product specified and included as minimum:
   1. Data sheets for each product supplied.

C. Shop Drawings: Provide the following as minimum:
   1. Submit shop drawings for fabrication and installation of pre-cast concrete structures and cast-in-place concrete structures including the following:
      a. Steel reinforcement drawings.
      b. Elevation showing openings, pulling irons, cable supports, sump, steps, covers, frames and other details.

D. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Certified "As-Built"/"As-Installed" drawings.
   2. Copies of all approved Product Data.

1.06 QUALITY ASSURANCE:

A. Manufacturer Qualifications:
   1. The manufacturer shall be by a company specializing in providing precast products and services normally associated with precast-concrete construction. Design of precast handholes shall be prepared by a professional engineer licensed in the state associated with the project to conform to the procedures set forth in ACI 318 and applicable standards of this specification and of the size, shape, and details indicated or specified.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Ducts:
   1. Carlon.
   2. Certain-Teed.
   3. Cantex.

B. Duct Spacers:
   1. Carlon.
   2. CertainTeed.
   3. Formex.
   4. Professional Plastics.

C. Concrete Inserts:
   1. Unistrut Corporation.
   2. B Line Systems, Inc.

D. Precast Handholes and Manholes:
   1. Barbour Concrete Co.
   2. Champion Precast Inc.
   3. Old Castle.
   4. Engineer approved equal.

2.02 DUCTS:

A. Conduit Types for Concrete Encasement:
   1. Schedule 40:
      a. Tested to Underwriters' Laboratories, Inc. (UL) Standard UL 651.

b. Schedule 40, Heavy Wall, Thickness conforming to NEMA TC-2 and TC-3.

B. Rated for use with 90°C conductors.
C. Provide with all necessary end bells, couplings, offset couplings, elbows, plugs, and other fittings.
D. Sizes as indicated.
E. Provide PVC coated rigid galvanized steel elbows for all duct termination risers and all non-sweeping 90 degree bends.
F. Provide PVC-Coated Rigid Steel conduit for all risers, through floor, and through wall penetrations.
G. Provide prefabricated duct spacers (trench cards) or interlocking type plastic duct spacers for duct spacing as indicated.

2.03 REINFORCING STEEL:

A. Provide as specified in Division 03.

2.04 CONCRETE:

A. Provide as specified in Division 03 and as indicated.

2.05 PRECAST HANDHOLES AND MANHOLES:

A. Precast concrete with precast concrete base and top slab shall conform to ASTM C857 and C858, and Concrete Division 03.
B. Units shall be constructed monolithically or of assembled sections with tongue-and-groove joints.
C. Concrete top cover shall be removable with recessed galvanized steel lifting inserts. Lifting inserts shall conform to ASTM C857.
D. Provide a flush mounted 30-inch manhole frame and cover shall be cast in the center of the cover.
E. Provide flush mounted plastic coated pulling irons in the walls located opposite of each set of duct openings.
F. Provide duct terminators to accommodate ducts entering as indicated.
G. Provide 8-inch sump hole through base slab.
H. Provide galvanized cable rack supports in each wall.
I. Provide submittal for precast reinforced concrete handholes prior to installation. The submittal shall be sealed by a professional engineer licensed in the state associated with the project.

2.06 CASTINGS:

A. Manhole Frames and Covers:
1. ASTM A48, Class 30B. Cover shall be marked with “Electric.”
2. Watertight bolt-down type with drop handles.
3. Machine-bearing surfaces to provide an even seating.
4. Coat with coal-tar pitch varnish or equivalent coating system.

2.07 WARNING TAPE:

A. Standard detectable warning tape, 4-mil 3 inch wide tape, red with black letters imprinted with "CAUTION BURIED ELECTRIC CABLE BELOW".

2.08 "PULLING IN" ROPE:

A. Nylon or nylon equivalent composite.
B. Minimum average breaking strength: 2000 pounds.

PART 3 - EXECUTION

3.01 EXCAVATION AND TRENCHING FOR DUCT BANKS AND HANDHOLES

A. Perform as specified in Division 31.
B. Work with extreme care near existing underground utilities to avoid damaging them.
C. Pitch the trench uniformly toward handholes or both ways from high points between handholes for required drainage.
D. Notify the Owner's representative for inspection prior to any duct bank installation and prior to concrete placement.

3.02 INSTALLATION:

A. Duct Banks:
   1. Ducts:
      a. Assemble as follows:
         (1) On spacers to maintain horizontal and vertical separation indicated.
         (2) With joints in adjacent ducts staggered.
         (3) All joints watertight by application of joint sealer compound furnished by duct manufacturer.
         (4) No reinforcing steel or other ferrous material between individual ducts.
      b. Securely tie overall at 5 foot or closer intervals as required.
      c. Secure to anchors after assembling to prevent flotation when placing concrete.
      d. Slope towards handholes with a minimum continuous slope of 1/2 percent.
      e. Align ducts for each 100 feet not greater than 4 inches horizontal.
      f. All risers shall be PVC coated rigid galvanized steel as specified.
      g. All elbows at duct termination risers and non-sweeping bends shall be PVC coated rigid galvanized steel as specified.
      h. Install end bells flush with face of concrete at each handhole and termination point unless indicated otherwise.
      i. Immediately after cleaning, install a "pulling in" rope in each duct, and plug each end of all ducts.
   2. Install detectable warning tape along the entire length of duct banks at a depth of 12 inches below grade or as indicated on drawings.
   3. Reinforcing:
      a. Duct banks shall be steel reinforced at the following locations:
         (1) Within 10-ft of and under all roadways and parking areas.
         (2) Within 10-ft of all locations where duct bank ties into or passes under a structure including buildings and manholes and handholes.
         (3) Other locations as indicated.
      b. Where duct banks terminate at vertical concrete structures (e.g. manholes and handholes), drill and epoxy longitudinal duct bank reinforcement into the structure.
   4. Concrete:
      a. Concrete shall be installed for all duct bank.
      b. Do not place prior to inspection and approval of duct and reinforcing installation by Engineer.
      c. Place as specified in Division 03.
      d. Mark concrete using red sprinkled (dry shake) pigmentation or by a red color admixture in concrete according to ASTM C979/C979M.
B. Precast Handholes and Manholes:

1. Install a minimum of 6 inches of compacted granular material on undisturbed soil below handhole.
2. Place at location and alignment as indicated.
3. Top slab and handhole and manhole shall be set flush with finished grade.
4. Install conduits as indicated.
5. Provide sufficient cable slack during installation to rack and secure cabling around the handhole walls.

C. Duct and Conduit Sealing:
1. Seal the ducts and conduits at building entrances and at outdoor equipment with a suitable non-hardening compound to prevent the entrance of moisture and gases. Refer to Section 26 05 33 for duct seal requirements.

3.03 BACKFILLING:

A. Provide backfill and compaction as specified in Division 31.

3.04 ADJUSTING AND CLEANING:

A. Rod and clean all ducts with suitable cleaners, swabs, and mandrels after completion of the duct bank.

END OF SECTION 26 05 43

SECTION 26 05 48 – VIBRATION AND SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes the following:
   1. Isolation pads.
   2. Spring isolators.
   3. Restrained spring isolators.
   4. Channel support systems.
   5. Restraint cables.
   6. Hanger rod stiffeners.
   7. Anchorage bushings and washers.

B. Related Sections include the following:
   1. Section 26 05 33 - Raceways, Boxes, Seals, and Fittings for Electrical Systems: For commonly used electrical supports and hardware materials and installation requirements.

1.03 REFERENCE STANDARDS:

A. American Society for Testing and Materials (ASTM)
   1. ASTM-A492, “Standard Specification for Stainless Steel Rope Wire”
   2. ASTM A603, “Standard Specification for Zinc-Coated Steel Structural Wire Rope”
   3. ASTM E488, “Standard Test Methods for Strength of Anchors in Concrete Elements”

B. American Welding Society
   1. AWS D1.1/D1.1M, “Structural Welding Code – Steel”.

C. International Building Code (IBC)

D. International Code Council (ICC)
   1. ICC-ES, “ICC Evaluation Services”

E. Metal Framing Manufacturers Association (MFMA)
   1. MFMA-3, “Metal Framing Standards Publication”

F. National Fire Protection Association (NFPA).
   1. NFPA 70, “National Electrical Code (NEC)”.

G. Nationally Recognized Testing Laboratory (NRTL)

H. Occupational Safety and Health Administration(OSHA)
   1. OSHA 29 CFR 1910.7, “Definition and requirements for a nationally recognized testing laboratory”.

I. Office of Statewide Health Planning and Development for the State of California (OSHPD)

1.04 DEFINITIONS:

A. The IBC: International Building Code.

B. ICC-ES: ICC-Evaluation Service.

C. OSHPD: Office of Statewide Health Planning and Development for the State of California.

1.05 PERFORMANCE REQUIREMENTS:

A. Seismic-Restraint Loading:
   1. Site Class as Defined in the IBC: D.
   2. Assigned Seismic Category : B.
      a. Importance Factor, Ie = 1.25.
      b. Mapped Special Acceleration Parameters:
         (1) $S_s = 0.091$
         (2) $S_1 = 0.067$
      c. Design Acceleration Parameters:
         (1) $S_{ds} = 0.097$
         (2) $S_{d1} = 0.106$

1.06 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

B. Product Data: For the following:
   1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.
   2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of seismic-restraint component used.
      a. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an agency acceptable to authorities having jurisdiction.
      b. Annotate to indicate application of each product submitted and compliance with requirements.
   3. Restrained-Isolation Devices: Include ratings for horizontal, vertical, and combined loads.

C. Delegated-Design Submittal: For vibration isolation and seismic-restraint details indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Design Calculations: Calculate static and dynamic loading due to equipment weight and operation, seismic forces required to select vibration isolators and seismic restraints.
      a. Coordinate design calculations with wind-load calculations required for equipment mounted outdoors. Comply with requirements in other Division 26 Sections for equipment mounted outdoors.
   2. Indicate materials and dimensions and identify hardware, including attachment and anchorage devices.
   3. Field-fabricated supports.
   4. Seismic-Restraint Details:
      a. Design Analysis: To support selection and arrangement of seismic restraints. Include calculations of combined tensile and shear loads.
      b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.

c. Preapproval and Evaluation Documentation: By an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

D. Coordination Drawings: Show coordination of seismic bracing for electrical components with other systems and equipment in the vicinity, including other supports and seismic restraints.
E. Qualification Data: For professional engineer and testing agency.
F. Welding certificates.
G. Field quality-control test reports.

1.07 QUALITY ASSURANCE:

A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
B. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.
C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M.
D. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval OPA number from OSHPD, preapproval by ICC-ES, or preapproval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.
E. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 VIBRATION ISOLATORS:

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Ace Mountings Co., Inc.
   2. Amber/Booth Company, Inc.
   3. California Dynamics Corporation.
   4. Isolation Technology, Inc.
   5. Kinetics Noise Control.
   6. Mason Industries.
   7. Vibration Eliminator Co., Inc.
   8. Vibration Isolation.
   9. Vibration Mountings & Controls, Inc.
B. Pads : Arrange in single or multiple layers of sufficient stiffness for uniform loading over pad area, molded with a nonslip pattern and galvanized-steel baseplates, and factory cut to sizes that match requirements of supported equipment.
   1. Resilient Material: Oil- and water-resistant neoprene.
C. Spring Isolators : Freestanding, laterally stable, open-spring isolators.
   1. Outside Spring Diameter: Not less than 80% of the compressed height of the spring at rated load.

2. Minimum Additional Travel: 50% of the required deflection at rated load.
3. Lateral Stiffness: More than 80% of rated vertical stiffness.
4. Overload Capacity: Support 200% of rated load, fully compressed, without deformation or failure.
5. Baseplates: Factory drilled for bolting to structure and bonded to 1/4-inch- (6-mm-) thick, rubber isolator pad attached to baseplate underside. Baseplates shall limit floor load to 500 psig (3447 kPa).
6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

D. Restrained Spring Isolators : Freestanding, steel, open-spring isolators with seismic or limit-stop restraint.
1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to weight being removed; factory-drilled baseplate bonded to 1/4-inch- (6-mm-) thick, neoprene or rubber isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
2. Restraint: Seismic or limit-stop as required for equipment and authorities having jurisdiction.
3. Outside Spring Diameter: Not less than 80% of the compressed height of the spring at rated load.
4. Minimum Additional Travel: 50% of the required deflection at rated load.
5. Lateral Stiffness: More than 80% of rated vertical stiffness.
6. Overload Capacity: Support 200% of rated load, fully compressed, without deformation or failure.

2.02 SEISMIC-RESTRAINT DEVICES:

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Amber/Booth Company, Inc.
2. California Dynamics Corporation.
3. Cooper B-Line, Inc.; a division of Cooper Industries.
4. Hilti Inc.
5. Loos & Co.; Seismic Earthquake Division.
6. Mason Industries.
7. TOLCO Incorporated; a brand of NIBCO INC.
8. Unistrut; Tyco International, Ltd.

B. General Requirements for Restraint Components: Rated strengths, features, and application requirements shall be as defined in reports by an agency acceptable to authorities having jurisdiction.
1. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.

C. Channel Support System: MFMA-3, shop- or field-fabricated support assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; and rated in tension, compression, and torsion forces.

D. Restraint Cables: ASTM A492 stainless-steel cables with end connections made of steel assemblies with thimbles, brackets, swivels, and bolts designed for restraining cable service; and with a minimum of two clamping bolts for cable engagement.
E. Hanger Rod Stiffener: Stainless steel tube or stainless steel slotted-support-system sleeve with internally bolted connections to hanger rod. Do not weld stiffeners to rods.
F. Bushings for Floor-Mounted Equipment Anchor: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchors and studs.
G. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices.
H. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.
I. Mechanical Anchor: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchors with strength required for anchor and as tested according to ASTM E488. Minimum length of eight times diameter.
J. Adhesive Anchor: Drilled-in and capsule anchor system containing polyvinyl or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

2.03 FACTORY FINISHES:
A. Finish: Manufacturer's standard prime-coat finish ready for field painting.

PART 3 - EXECUTION

3.01 EXAMINATION:
A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements for installation tolerances and other conditions affecting performance.
B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS:
A. Multiple Raceways or Cables: Secure raceways and cables to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction.
B. Hanger Rod Stiffeners: Install hanger rod stiffeners where required to prevent buckling of hanger rods due to seismic forces.
C. Strength of Support and Seismic-Restraint Assemblies: Select sizes of components so strength will be adequate to carry present and future static and seismic loads within specified loading limits.

3.03 SEISMIC-RESTRAINT DEVICE INSTALLATION:
A. Equipment and Hanger Restraints:
1. Install restrained isolators on electrical equipment.

2. Install resilient, bolt-isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch (3.2 mm).
3. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction providing required submittals for component.

B. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

C. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

D. Drilled-in Anchors:
1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
5. Set anchors to manufacturer's recommended torque, using a torque wrench.
6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.04 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION:

A. Install flexible connections in runs of raceways, cables, wireways, cable trays, and busways where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where they terminate with connection to equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

3.05 FIELD QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections and prepare test reports.

B. Perform tests and inspections.

C. Tests and Inspections:
1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
2. Schedule test with Owner, through Structural Engineer, before connecting anchorage device to restrained component (unless post connection testing has been approved), and with at least seven days' advance notice.
3. Obtain Structural Engineer's approval before transmitting test loads to structure. Provide temporary load-spreading members.
4. Test at least four of each type and size of installed anchors and fasteners selected by Structural Engineer.

5. Test to 90% of rated proof load of device.
6. Measure isolator restraint clearance.
7. Measure isolator deflection.
8. Verify snubber minimum clearances.
9. If a device fails test, modify all installations of same type and retest until satisfactory results are achieved.

D. Remove and replace malfunctioning units and retest as specified above.
E. Prepare test and inspection reports.

3.06 ADJUSTING:

A. Adjust isolators after isolated equipment is at operating weight.
B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
C. Adjust active height of spring isolators.
D. Adjust restraints to permit free movement of equipment within normal mode of operation.

END OF SECTION 26 05 48

SECTION 26 05 53 – IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies electrical identification work including the following:
   1. Buried cable and duct bank warnings.
   2. Electrical power, control, and communication conductors (and raceways).
   3. Operational instructions and warnings.
   4. Danger, caution and warning signs.
   5. Equipment/system identification nameplates.
   6. Source of supply and circuit identification labels.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 73 – Power System Studies.

1.04 REFERENCE STANDARDS:

A. Applicable Standards: Comply with the applicable requirements of the following standards.
   1. American Society of Mechanical Engineers (ASME):
      a. A13.1 - Scheme for the Identification of Piping Systems.
   2. Federal Specifications (FS):
      a. FS L-P-387 - Polyethylene Low and Medium Density – Molding Material (for designation plates).
   3. National Electrical Manufacturers Association (NEMA):
      a. Z535.1 - Safety Colors.
      b. Z535.4 - Product Safety Signs and Labels.
   4. National Fire Protection Association (NFPA):
      a. 70 - National Electrical Code (NEC), as applicable to installation of identifying labels and markers for wiring and equipment.
      b. 70E - Electrical Safety in the Workplace.
      c. 72 - National Electric Safety Code (NESC) – IEEE C2.
   5. Occupational Safety and Health Administration (OSHA):
      a. 29 CFR 1910.144 - Safety Color Code for Marking Physical Hazards.
      b. 29 CFR 1910.145 - Specifications for Accident Prevention Signs and Tags.
   6. Underwriters Laboratories (UL), pertaining to electrical identification systems:
      a. 969 - Standards for Marking and Labeling Systems.

1.05 SUBMITTALS:

A. Refer to Division 01 and Section 26 05 10 - General Electrical Requirements for administrative and procedural requirements for submittals.
B. Includes, but not limited to, the following:
   1. Product Data: Submit manufacturer's data on electrical identification materials and products.

2. Samples: Submit samples of each color, lettering style, and other graphic representation required for each identification material or system.

1.06 QUALITY ASSURANCE:

A. Comply with ASME A13.1 and IEEE C2.
B. Comply with NFPA 70.
C. Comply with 29 CFR 1910.144 and 29 CFR 1910.145.
D. Comply with NEMA Z535.4 for safety signs and labels.
E. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.

1.07 COORDINATION:

A. Coordinate identification names, abbreviations, colors, and other features with requirements in other sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual; and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout Project.
B. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
C. Coordinate installation of identifying devices with location of access panels and doors.
D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Subject to compliance with requirements, provide electrical identification products of one of the following (for each type marker):
1. Brady Worldwide, Inc.
2. Panduit Corp.
3. Seton Identification Products.
4. Thomas & Betts Corp.

2.02 ELECTRICAL IDENTIFICATION MATERIALS:

A. General: Except as otherwise indicated, provide manufacturer's standard products of categories and types required for each application. Where more than single type is specified for an application, selection is Installer's option; but provide single selection for each application.
B. Orange "Emergency" and "( )-VOLT" Conduit, Equipment, Box, and Cable Tray Markers:
1. General: Self-adhesive vinyl tape marker not less than 3 mils thick. Provide 1-1/8 inch wide by 4-1/2 inch long marker for 2 inch and smaller conduit. Provide 2-1/4 inch wide by 9 inch long marker for 2-1/2 inch and larger conduit and all cable tray. Except as otherwise indicated, provide black lettering which indicates highest voltage of cables(s) in conduit or cable tray. Provide black lettering that indicates "Emergency" power circuit is in conduit or cable tray.
2. Colors: Unless otherwise indicated or required by governing regulations, provide orange background tape marker.
C. Underground Type Plastic Line Marker:
1. General: Permanent, bright-colored, continuous-printed plastic tape marker, intended for direct-burial service; not less than 6 inches wide by 4 mils thick. Provide tape marker

with printing which most accurately indicates type of service of buried cable or duct bank. (Provide embedded continuous metallic strip or core when used with non-metallic conduit and fiber optic cable to enable locating.)

D. Wire/Cable Identification Bands:
   1. General: Vinyl self-adhesive cable/conductor markers of wrap-around type, print-on type with clear plastic self-adhesive cover flap; numbered to show circuit identification number indicated on Drawings or Shop Drawings.

E. Plasticized Tags:
   1. General: Preprinted or partially preprinted accident-prevention and operational tags, on plasticized card stock with matt finish suitable for writing, approximately 3-1/4 inches by 5-5/8 inches, with brass grommets and wire fasteners, and with appropriate preprinted wording, including large-size primary wording, e.g., "DANGER, DO NOT OPERATE." Tags shall comply with OSHA requirements.

F. Self-Adhesive Plastic or Vinyl Signs:
   1. General: Self-adhesive or pressure-sensitive, preprinted, flexible vinyl signs for operational instructions and warnings; of sizes suitable for application areas and adequate for visibility, with proper wording for each application.
      a. Colors: Unless otherwise indicated or required by governing regulations, provide white signs with black lettering.

G. Baked Enamel "Danger" Signs:
   1. "DANGER" signs of baked enamel finish on 20-gauge minimum aluminum; of standard safety red, safety black, and safety white as defined by NEMA Z535.1; 14 inches by 10 inches size, except where 10 inches by 7 inches is the largest size which can be applied where needed, and except where larger size is needed for adequate vision; with recognized standard explanation wording, e.g., "_____VOLTS, KEEP AWAY." Sign shall conform to OSHA and NEMA Z535.4.

H. Baked Enamel "Caution" Signs:
   1. "CAUTION" signs of baked enamel finish on 20-gauge minimum aluminum; of standard safety yellow with safety black letters; 14 inches by 10 inches size, except where 10 inches by 7 inches is the largest size which can be applied where needed, and except where larger size is needed for adequate vision; with recognized standard explanation wording, e.g., "Caution for Ear Protection Required in this Area."

I. Based Enamel "WARNING" Signs:
   1. "WARNING" signs of baked enamel finish on 20-gauge minimum aluminum; of standard safety orange with safety black letters; 14 inches by 10 inches size, except where 10 inches by 7 inches is largest size that can be applied where needed and except where larger size is needed for adequate vision; with recognized standard explanation wording. Sign shall conform to OSHA and NEMA Z535.4.

J. Engraved Plastic-Laminate Nameplates:
   1. General: Engraving stock melamine plastic laminate nameplates, in sizes (minimum height of characters shall be 1/8 inch) and thicknesses specified or indicated, engraved with engraver's standard letter style of sizes and wording indicated, white face and black core plies (letter color) except as otherwise indicated, specified or required. Colors shall comply with OSHA and NEMA Z535.1. Nameplate shall be punched for mechanical fastening except where adhesive mounting is necessary because of the surface type it is mounted to, or where mechanical fastening will compromise the enclosure protection ratings.
      a. Thickness: 1/16-inch, for units up to 20 square inches or 8 inch length; 1/8-inch for larger units.

b. Fasteners: Self-tapping stainless steel screws, except contact-type permanent adhesive where screws cannot or should not penetrate surface it is mounted to.

2. Lettering and Graphics:
   a. Coordinate names, abbreviations, and other designations used in electric identification work with corresponding designations shown, specified, or scheduled. Provide numbers, lettering, and wording as indicated or, if not otherwise indicated, as recommended by manufacturer or as required for proper identification and operation/maintenance of electrical systems and equipment. Comply with ASME A13.1 pertaining to minimum sizes for letters and numbers. Comply with OSHA requirements. Comply with design requirements of NEMA Z535.4.

PART 3 - EXECUTION

3.01 APPLICATION AND INSTALLATION:

A. General Installation Requirements:
   1. Install electrical identification products as indicated, in accordance with manufacturer's written instructions and requirements of NEC.
   2. Coordination: Where identification is to be applied to surfaces which require finish painting, install identification after completion of painting.
   3. Regulations: Comply with governing regulations and requests of governing authorities for identification of electrical work.

B. Conduit and Cable Tray Identification Markers:
   1. General: Where electrical conduit is exposed, apply identification markers on electrical conduit at 20 foot intervals (visible from the floor) and within 3 feet of all panelboards, switchboards, switchgear, automatic transfer switches, emergency generators, substations, switches, devices, and circuit breakers (readily visible when standing in front of equipment). Identification on cable tray shall be on outside of both sidewalls at 20 foot intervals.

C. Underground Cable, Conduit, and Duct Bank Identification Marker:
   1. General: During back-filling/top-soiling of each exterior underground direct buried electrical, signal or communication cable, conduit and duct bank, install continuous underground-type plastic line marker, located directly over the direct buried cable, conduit or duct bank at 12 inches below finished grade. Where multiple small direct buried cables are buried in a common trench and do not exceed an overall width of 16 inches, install a single line marker.
   2. Install line marker for every cable below grade, regardless of whether direct-buried, protected in conduit, or conduit in duct bank.

D. Wire/Cable Identification Bands:
   1. General: Apply cable/conductor identification bands, including circuit number, on each wire/cable in each box/enclosure/cabinet where wires of more than one circuit or communication/signal system are present. Match identification with marking system used in panelboards, shop drawings, contract documents, and similar previously established identification for project's electrical work.

E. Operational Identification and Warning Plasticized Tags and Metal Signs and Plastic Signs:
   1. General: Wherever reasonably required to ensure safe and efficient operation and maintenance of electrical systems, and electrically connected mechanical systems and general systems and equipment, including prevention of misuse of electrical facilities by unauthorized personnel, install signs with instruction or warnings.

2. When signs are installed on switches, outlets, controls, devices and covers of electrical enclosures they may be self-adhesive vinyl or plastic.
3. Where detailed instructions or explanations are needed, provide plasticized tags with clearly written messages adequate for intended purposes.
4. Where switchboards, switchgear, motor control centers, and panelboard are supplied by a feeder, provide an informational sign indicating each device or piece of equipment from where the power originates.
5. Receptacle outlets and switches shall include a source of supply circuit label that includes the panelboard tag and circuit number. E.g “ADM-PNL-040-01”.

F. Danger Signs:
1. General: In addition to installation of danger signs specified, indicated, and required by governing regulations and authorities, install appropriate danger signs at locations indicated and at locations subsequently identified by Installer of electrical work as constituting similar dangers for persons in or about Project.
2. XXXX Volts: Install danger signs (with actual circuit voltage) on all building doors, substations, switchgear, switchboards, panelboards switches, circuit breakers, etc., wherever it is possible (under any circumstances) for persons to come into contact with electrical voltages to ground greater than 277V.
3. Critical Switches/Controls: Install danger signs on switches and similar controls, regardless of whether concealed or locked up, where untimely or inadvertent operation (by anyone) could result in significant danger to persons or damage to or loss of property.
4. Provide the following danger sign on the equipment indicated:
   a. "Danger This Machine Starts Automatically" on all fire pumps, air compressors and emergency generators.
5. Provide the following danger signs on the doors leading to the equipment indicated:
   a. "Danger Hearing Protection Required" on all emergency generator room doors.
   b. "Danger: No Smoking, Matches or Open Flames" on all emergency generator room doors (, personnel doors opening into aircraft hangar,) and battery room doors.

G. Warning Signs:
1. Provide an orange background sign with black letters reading "WARNING: LOAD SIDE OF SWITCH MAY BE ENERGIZED BY BACKFEED" on all tie switches and tie circuit breakers.
2. Provide cable tray warning signs with 1-1/2-inch high black letters on an orange background that reads: "Warning! Not to be used as a walkway, ladder or support for ladders for personnel." Provide on each side of cable tray at 10-foot intervals, visible from the floor below.
3. Provide Arc Flash Warning signs on electrical equipment such as switchboards, switchgear, panelboards, industrial control panels, motor control centers and meter socket enclosures that are likely to require examination, adjustment, servicing, or maintenance while energized. Marking shall be permanently affixed and of a durable nature to withstand the environment within which it is installed.
4. Provide Available Fault Current Warning signs on electrical equipment as specified in Section 26 05 73. Label shall include possible incident energy exposure within arc flash boundary in front of equipment as well as meet NFPA 70E for additional content.

H. Caution Signs:
1. Provide yellow background caution signs with black letters on the doors leading to the equipment indicated:
   a. "Caution Ear Protection Required in this Area" on all emergency generator room doors.

2. Provide the following yellow background caution sign with black letters on all automatic transfer switches, switches, circuit breakers, equipment, and emergency panelboards that are energized by the emergency power system:
   a. "Caution Automatically Energized by the Emergency Power System."

I. Equipment/System Identification Nameplates:

1. General: Install engraved plastic-laminated nameplates on each major unit of electrical equipment in the building; including central or master unit of each electrical system including communication/control/signal/alarm systems, unless unit is specified with its own self-explanatory identification or signal system. Except as otherwise indicated, provide single line of text, 1/2-inch high lettering on 1-1/2-inch high sign (2 inches high were two lines are required), black lettering on white field. Provide text matching terminology and numbering of the contract documents and shop drawings. Nameplate shall include unit designation, normal source circuit number ("Fed from..."), circuit voltage, and other data specifically indicated. Nameplate shall indicate normal source circuit number ("Fed from..."), and emergency source circuit number ("Fed from..."), when the equipment is a transfer switch or fed directly from a transfer switch. Provide nameplates for each unit of the following categories of electrical work:
   a. Switchboards, panelboards, electrical cabinets, and enclosures. (Include main bus ampacity on the nameplate.)
   b. Access panel/doors to electrical facilities.
   c. Major electrical switchgear (Include main bus ampacity on the nameplate.)
   d. Electrical substations (Include main bus ampacity on the nameplate.)
   e. Motor control centers, (Include main bus ampacity on the nameplate.) and individual motor starters.
   f. Disconnect switches.
   g. Push buttons, selector switches, indicating lights. (Circuit number and voltage not required on nameplate).
   h. Power transfer equipment: Contactors and transfer switches.
   i. Lighting control equipment and contactors.
   j. Remote controlled switches, dimmer modules, and control devices.
   k. Transformers (Include primary voltage, secondary voltage, number of phases, feeder, and panelboards or equipment supplied by the secondary.)
   l. Inverters. (Include input voltage, output voltage, number of input phases.)
   m. Rectifiers. (Include input voltage, output voltage, and number of phases.)
   n. Frequency converters. (Include input and output frequency.)
   o. Battery racks.
   p. Power generating units.
   q. Telephone cabinets and switching equipment. (Circuit number and voltage not required on nameplate.)
   r. Clock/program master equipment.
   s. TV/audio monitoring master station.
   t. Fire alarm and mass notification systems master station.
   u. Security monitoring master station.
   v. Public address system.
   w. Uninterruptible power supplies (UPS).
   x. Wireway used as auxiliary gutter tap locations with circuit number of circuit being tapped. Provide on outside of wireway.
   y. Provide conduit markers on all conduit and pull boxes that contain medium voltage conductors and indicate voltage.

z. Provide "EMERGENCY" conduit markers on all conduit and pull boxes that contain emergency power conductors.
aa. Switchboard main switches and circuit breakers.

2. Install markers, tags, nameplates, and signs at locations indicated or, where not otherwise indicated, at location for best convenience of viewing without interference with operation and maintenance of equipment. Secure the identification with fasteners, except use adhesive where fasteners should not or cannot penetrate surface.

END OF SECTION 26 05 53

SECTION 26 05 73 – POWER SYSTEM STUDIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes computer-based fault-current, arc flash hazard analysis, and overcurrent protective device coordination studies.

B. The study shall be provided for the electrical distribution system and include all power sources (normal and emergency) down to the branch circuit overcurrent protective device and equipment.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 53 – Identification for Electrical Systems.

1.04 REFERENCE STANDARDS:

A. The study shall be completed in accordance with the latest edition of the following standards:
   1. IEEE Standard 242 – Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems (IEEE Buff Book).
   2. IEEE 399 – Recommended Practice for Industrial and Commercial Power Systems Analysis (Brown Book).

B. The arc flash hazard analysis shall be completed in accordance with latest editions of the following standards:
   1. IEEE Standard 1584 – Guide for Performing Arc-Flash Hazard Calculations.
   2. NFPA70E – Standard for Electrical Safety Requirements for Employee Workplaces.

1.05 PERFORMANCE/DESIGN CRITERIA:

A. The study shall calculate the available short-circuit current at each point in the electrical distribution system. The overcurrent protective devices shall have an interrupting rating equal to or greater than the available short-circuit current at the point of application.

B. The study shall examine proper protection of electrical system components and utilization equipment such that the equipment has a sufficient short-circuit current rating.

C. The overcurrent protective devices shall be analyzed for selective coordination. This analysis shall identify any potential selective coordination problems up to the available short-circuit current. Any areas where the overcurrent protective devices are not selectively coordinated shall be explicitly noted and recommendations shall be made to achieve selective coordination.

D. The study shall include an arc flash hazard analysis for electrical distribution equipment. The analysis shall determine the flash protection boundary, incident energy, and required level of personal protective equipment (PPE) for workers at the electrical distribution equipment. The electrical distribution equipment shall be labeled with this information in accordance with codes and standards.

1.06 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

B. Product Data: Submit computer analysis software to be used for the specified studies.

C. The results of the studies shall be summarized in report format with explanation of how to interpret the data.
D. As a minimum the report shall include the following:
   1. Short Circuit Study:
      a. A printout of input data, calculated results and an explanation of how to interpret the data.
      b. A one-line diagram identifying all bus locations and the maximum available three-phase and line-to-ground short-circuit currents at each bus.
      c. A bus-to-bus listing of the maximum available short-circuit current expressed in RMS symmetrical amperes and the X over R ratio of that fault current.
      d. A table of specified equipment short-circuit ratings versus calculated short-circuit current values with notations of locations where are specified equipment short-circuit ratings are less or greater than required at the point of application.
      e. An analysis of the results in which any overrating or inadequacies shall be called to the attention of the Engineer and recommendations made for improvements.
   2. Protective Device Coordination Study:
      a. Time-current characteristic curve drawings on log-log printouts which illustrate:
         (1) The recommended settings for all adjustable relays, overcurrent protective devices and ground fault protective devices provided for the project.
         (2) The key or limiting overcurrent device characteristics, load characteristics, and protection requirements affecting the settings or ratings of the overcurrent protective devices supplied.
         (3) The degree of selective coordination achieved with the overcurrent protective devices supplied.
      b. A tabulation of the recommended settings for all adjustable relays, overcurrent protective devices and ground fault protective devices and type selections for fuse protective devices supplied.
      c. An analysis of the results in which any inadequacies related to selective coordination shall be called to the attention of the Engineer with recommendations for improved coordination.
   3. Arc Flash Hazard Analysis Study:
      a. The following for each piece of switchgear, switchboard, motor control center, distribution panel, panelboard, automatic transfer switch, enclosed circuit breaker, disconnect switch, and equipment control panel installed on the project:
         (1) Minimum Arc Fault Current, Arc Flash Boundary and Arc Fault Incident Energy Level (cal/cm2).
         (2) Risk of personnel injury as a result of exposure to incident energy released during an arc flash event.
         (3) Appropriate ratings of personal protective equipment (PPE).
         (4) The Flash Protection Boundary (approach limit distance).
         (5) Information for equipment specific arc-flash hazard warning labels.
      b. Recommendations and methods to mitigate the hazard risk, where applicable, in order to reduce PPE requirements.
   4. Cut sheets and submittal information on the Arc Flash warning labels being provided. Coordinate with Section 26 05 53 – Identification for Electrical Systems.

1.07 QUALITY ASSURANCE:

A. The company and individual(s) performing the study shall have experience in power system analysis and completed projects of similar size and scope. The individual(s) performing the

study shall be a registered Professional Engineer in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of Engineer.

B. The company performing the study shall have the capability and experience to provide assistance during system start up.
C. Comply with IEEE 242 for short-circuit currents and coordination time intervals.
D. Comply with IEEE 399 for general study procedures.
E. Comply with IEEE 1584 or NFPA 70E for arc flash hazard analysis.

1.08 SEQUENCING AND SCHEDULING:

A. The selection of the company and the individual performing the study shall be submitted and approved by the design Engineer prior to the start of the study.
B. The study shall be completed and submitted and approved prior to the facility startup.

PART 2 - PRODUCTS

2.01 GENERAL:

A. The short circuit, protective device coordination, and flash hazard analysis study shall be completed with the computer software program SKM Power Tools. Other computer software programs shall not be allowed.
B. The Contractor shall provide all lengths of cable for use in the studies.
C. All equipment ratings, make, and model information shall be obtained by the Contractor from the equipment manufacturers and/or suppliers and provided for use in the studies.
D. Information on the electrical service including available fault current, transformer impedance, primary fuse ratings, primary cable size, and any other required information shall be obtained from the local utility for inclusion in the studies.
E. The study shall be inclusive of the entire electrical distribution system from all power sources (normal and emergency) down to the branch circuit overcurrent protective device and equipment.
F. Separate calculations shall be performed for both the normal and emergency sources. Device settings shall be based upon the normal source study.
G. The Arc Flash Study shall be based on the study that results in the highest incident energy.

2.02 SHORT CIRCUIT COORDINATION STUDY:

A. The short circuit study shall as minimum include the following:
    1. A schematic one-line drawing of the entire electrical system included in the study, from the power company system including the point of delivery, to each primary transformer, and including all main secondary buses of each transformer included in the study. Secondary buses shall include multiple secondary transformations within the scope of the study. Each device shall be identified using project assigned identification labels. Each motor 10 hp and larger shall be shown and identified. Each bus shall be assigned an identification number.
    2. Source voltage and impedance data shall be given in the analysis, including reactance and resistance in OHMS to the source, and available symmetrical and asymmetrical short circuit amperes at the point of delivery of electrical power. Short circuit amperes shall be based on an assumed bolted three-phase and line-to-ground short circuits.
    3. At each bus, including buses of all primary protective and switching devices, primary and secondary of all transformers, all secondary main and feeder breakers, and all secondary devices and panelboards within the scope of the study, the following shall be calculated:

a. Symmetrical RMS short circuit amperes, calculated using total source and motor contribution reactance and resistance values.
b. Asymmetrical average 3 phase RMS amperes at 1/2 cycle, calculated using actual total source and motor contribution X/R ratio.
c. Reactance ("X") and Resistance ("R") in OHMS at the voltage of the device being examined, including both The Power Company source and all motor contributions.

4. Calculation sheets for cable sections shall indicate voltage, wire size, cable length, reactance and resistance of the section in OHMS and total "X" and "R" to the source.
5. Calculation sheets for transformer sections shall indicate transformer kVA, secondary voltage, percent impedance, percent reactance, percent resistance, and total "X" and "R" value in OHMS at the secondary voltage to source, including The Power Company source impedance plus any primary motor contribution.
6. Calculation sheets for busway and miscellaneous devices shall provide all pertinent parameters including operating voltage, section "X" and "R" values in OHMS, and total "X" and "R" values in OHMS to the source, based on source impedance plus any motor contribution.
7. Bus summary sheets shall be provided giving consecutive bus numbers, description, voltage, "X" and "R" values in OHMS including The Power Company plus all motor contributions, symmetrical and asymmetrical short circuit amperes, X/R ration, and asymmetrical factor.
8. Motor summary sheets shall provide motor description and all pertinent motor data including subtransient reactance for each motor 10 hp and larger. Symmetrical short circuit amperes shall be given for each motor at the motor terminals.

2.03 PROTECTIVE DEVICE COORDINATION STUDY:

A. The protective device coordination study shall as a minimum include the following:
1. Time-current coordination plots shall be made on log-log software generated plots and shall graphically indicate the coordination proposed for all of the key systems. The plots shall include complete titles, one-line diagram and legend.
2. The Power Company's relay, fuse, or protective device shall be plotted with all load protective devices at the same voltage.
3. Transformer primary protective device, transformer magnetic inrush, transformer ANSI withstand points, secondary voltage fuse or circuit breaker and largest feeder fuse or circuit breaker shall be plotted at the secondary voltage. Circuit breaker curves shall include complete operating bands, terminating with the appropriate available short circuit current. Fuse curves shall be identified as either total clearing time or damage time as applicable.
4. Low voltage circuit breakers shall have instantaneous, short delay, long-time pick-up and ground fault trip settings and ground fault ampere and time delay settings identified as plotted. Sensor or monitor rating shall be stated for each circuit breaker. All regions of the circuit breaker curve shall be identified.
5. The coordination plots shall include significant motor starting characteristics and large motor protective devices.
6. Feeder circuit breakers shall have the time-damage curve of the feeder conductors plotted to indicate protection of the conductor insulation at the total clearing time of the circuit breaker or fuse. The time-damage point shall be calculated for the specific parameters of conductor insulation used, with average 3 phase RMS asymmetrical amperes as 1/2 cycle calculated using actual resistance and reactance values of the source plus all motor contributions which exist at the load end of the feeder conductors.

7. A determination of settings or ratings for the overcurrent and ground fault protective devices supplied. Where necessary, an appropriate compromise shall be made between selective coordination and service continuity with selective coordination considered more important than system service continuity. The time-current coordination analysis shall be performed with the aid appropriate software.
8. A summary tabulation shall be provided listing manufacturer and type for all overcurrent protective devices and all recommended settings of each adjustable band included in each device.
9. Settings of protective devices shall minimize the arc flash hazard while maintaining selective coordination.

2.04 ARC FLASH HAZARD ANALYSIS STUDY:

A. The arc flash hazard analysis study shall as minimum include the following:
   1. Calculate incident energy levels and flash protection boundaries at all relevant equipment busses based on available short-circuit current, protective device clearing time and other applicable one-line diagram information.
   2. As a minimum, the following shall be calculated for each piece of switchgear, switchboard, motor control center, distribution panel, panelboard, automatic transfer switch, enclosed circuit breaker, disconnect switch, and equipment control panel to be installed on the project:
      a. Minimum Arc Fault Current, Arc Flash Boundary and Arc Fault Rating (cal/cm2).
      b. Risk of personnel injury as a result of exposure to incident energy released during an arc flash event.
      c. The appropriate ratings of personal protective equipment (PPE).
      d. The Flash Protection Boundary (approach limit distance) as required by NFPA 70E.
   3. Provide equipment specific arc-flash hazard warning label requirements per NEC Section 110.16, including all information specified to be provided on individual equipment warning labels.
   4. Provide recommendations and incorporate with the protective coordination study methods to mitigate the hazard risk, where applicable, in order to reduce PPE requirements.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are as indicated on Drawings.
B. Proceed with short circuit and coordination study only after relevant equipment submittals have been approved and assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

3.02 PROTECTIVE DEVICE SELECTION AND SETTINGS:

A. Prior to project Substantial Completion, the Contractor shall set all relays, overcurrent devices and ground fault protection devices and confirm selection of fuse overcurrent devices as follows:
   1. Relays: Reset all adjustable relay settings from the factory default settings to the settings recommended in the studies specified in this Section.

2. Circuit Breakers and Motor Circuit Protectors: Reset all adjustable trip settings from the factory default settings to the settings recommended in the studies specified in this Section.
3. Ground Fault Protection Devices: Reset all adjustable device settings from the factory default settings to the settings recommended in the studies specified in this Section.
4. Fuses: Confirm that fuse types installed on the project are as recommended in the studies specified in this Section.

B. Certification: Prior to project Substantial Completion, the Contractor shall submit a document certifying that the Contractor has completed the settings and selection scope specified to the Engineer.

3.03 INSTALLATION:

A. Install arc flash and available fault current labels on equipment as specified in Section 26 05 53 – Identification for Electrical Systems.

END OF SECTION 26 05 73

SECTION 26 09 23 - LIGHTING CONTROL EQUIPMENT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. Types of lighting control equipment specified in this Section include the following:
   1. Time controlled switches.
   2. Photo sensor controls.
   3. Standalone daylight-harvesting switching controls.
   4. Indoor occupancy sensors.
   5. Emergency shunt relays.

1.03 RELATED REQUIREMENTS:

A. Division 26 Sections for wires/cables, electrical boxes, fittings, and wiring devices which are required in conjunction with lighting control equipment work.
B. Section 26 05 10 – General Electrical Requirements.
C. Section 26 27 26 – Wiring Devices.

1.04 REFERENCE STANDARDS:

A. Applicable Standards: Comply with applicable requirements of the following standards.
   1. Electronic Industries Association (EIA):
      a. RS-232 - Interface between data terminal and equipment data communication equipment employing serial binary data interchange.
      b. RS-453 - Dimensional, Mechanical, and Electrical Characteristics Defining Phone Plugs and Jacks.
   2. National Electrical Manufacturers' Association (NEMA):
      a. Pub. No. 250 - Enclosures for Electrical Equipment (1,000V Maximum).
   3. National Fire Protection Association (NFPA):
      a. 70 - National Electrical Code (NEC): Comply with applicable local electrical code requirements of the authority having jurisdiction and NEC as applicable to construction and installation of lighting control and communications equipment.
   4. Underwriters Laboratories (UL): Provide lighting control equipment and components which are UL-listed and labeled.
      a. 486A - Wire Connectors and Soldering Lugs for Use with Copper Conductors.

1.05 SUBMITTALS:

A. Refer to Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.
B. Includes, but not limited to, the following:
   1. Product Data: Submit manufacturer's data on lighting control equipment and components.
   2. Device plates and plate color and material.
   3. Ballasts and lamp combinations compatible with dimmers.
   4. Wiring Diagrams: Power, signal, and control wiring.

5. Shop Drawings: Submit dimensioned drawings of lighting control equipment and components including, but not necessarily limited to, programmable controllers, transceivers, printers, relays, sensors, contactors, and switches. Provide floor plans that clearly identify each controlled zone, including the address code of each zone.
6. Wiring Diagrams: Submit wiring diagrams for lighting control equipment and components showing control wiring and interconnection wiring, including connections to equipment components and electrical power. Differentiate between portions of wiring that are manufacturer factory installed and portions that are field installed.
7. Agreement to Maintain: Prior to time of final acceptance, the Contractor shall submit four copies of an agreement for continued service and maintenance of lighting control equipment for Owner's possible acceptance. Offer terms and conditions for furnishing parts and providing continued testing and servicing, including replacement of materials and equipment, for a one year period with an option for renewal of the Agreement by the Owner.
8. Operation and Maintenance Manuals: Furnish maintenance manuals which contain equipment cuts, operating instructions, shop drawings, wiring diagrams, troubleshooting procedures, and spare parts list for equipment. Ensure that the manual includes operating instructions in addition to instructions for revising the system's software package.

C. Samples for Initial Selection: For master and remote-control stations, and faceplates with factory-applied color finishes and technical features.
D. Samples for Verification: For master and remote-control stations, and faceplates with factory-applied color finishes and technical features.

1.06 DELIVERY, STORAGE, AND HANDLING:

A. Deliver lighting control equipment and components in factory-fabricated type containers or wrappings that properly protect equipment from damage.
B. Store lighting control equipment in original packaging and protect from weather and construction traffic. Store at secured and insured warehouse location. Wherever possible, store indoors; where necessary to store outdoors, store above grade and enclose with watertight wrapping.
C. Handle lighting control equipment carefully to prevent physical damage to equipment and components. Do not install damaged equipment; remove from site and replace damaged equipment with new.

1.07 QUALITY ASSURANCE:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Subject to compliance with requirements, provide lighting control equipment of one of the following (for each type of equipment):
1. Crestron.
2. Cooper Industries, Inc.
3. Cutler-Hammer.
4. Eaton Corporation.

5. General Electric Co.
6. Hubbell Building Automation, Inc.
7. Intermatic, Inc.
8. Leviton Manufacturing Company, Inc.
9. Lighting Control and Design; Acuity Lighting Group, Inc.
10. Lightolier Controls.
11. Lithonia Lighting; Acuity Lighting Group, Inc.
12. Lutron Electronics, Inc.
13. RAB Lighting.
14. Sensor Switch, Inc.Square D Co.; a brand of Schneider Electric.
15. NSi Industries LLC; TORK Products.
16. Watt Stopper.

2.02 TIME SWITCHES:

A. Electronic Time Switches: Solid state, programmable, with alphanumeric display; complying with UL 917.
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Contact Configuration: DPST.
   3. Contact Rating: 20-A LED load, 120/240Vac.
   4. Programs: Eight on-off set points on a 24-hour schedule and an annual holiday schedule that overrides the weekly operation on holidays.
   5. Programs: Two on-off set points on a 24-hour schedule, allowing different set points for each day of the week and an annual holiday schedule that overrides the weekly operation on holidays.
   6. Circuitry: Allow connection of a photoelectric relay as substitute for on-off function of a program on selected channels.
   7. Astronomic Time: All channels.
   8. IAutomatic daylight savings time changeover.
   9. Battery Backup: Not less than seven days reserve, to maintain schedules and time clock.

2.03 OUTDOOR PHOTOELECTRIC SWITCHES:

A. Description: Solid state, with SPST dry contacts rated for 1,800VA tungsten LED load, to operate connected relay, load, contactor coils, or microprocessor input; complying with UL 773A.
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Light-Level Monitoring Range: 1.5 to 10 fc (16.14 to 108 lux), with an adjustment for turn-on and turn-off levels within that range[, and a directional lens in front of the photocell to prevent fixed light sources from causing turn-off].
   3. Time Delay: Fifteen second minimum, to prevent false operation.
   4. Surge Protection: Metal-oxide varistor.
   5. Mounting: Twist lock complies with NEMA C136.10, with base-and-stem mounting or stem-and-swivel mounting accessories as required to direct sensor to the north sky exposure.

2.04 DAYLIGHT-HARVESTING DIMMING CONTROLS:

A. System Description: Sensing daylight and electrical lighting levels, the system adjusts the indoor electrical lighting levels. As daylight increases, the lights are dimmed.

1. Lighting control set point is based on two lighting conditions:
   a. When no daylight is present (target level).
   b. When significant daylight is present.
2. System programming is done with two hand-held, remote-control tools.
   a. Initial setup tool.
   b. Tool for occupants to adjust the target levels by increasing the set point up to 25%, or by minimizing the electric lighting level.

B. Ceiling-Mounted Dimming Controls: Solid-state, light-level sensor unit, with separate controller unit, to detect changes in lighting levels that are perceived by the eye.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Sensor Output: 0 to 10Vdc to operate electronic dimming ballasts. Sensor is powered by controller unit.
3. Power Pack: Sensor has 24Vdc, Class 2 power source, as defined by NFPA 70.
4. Light-Level Sensor Set-Point Adjustment Range: 20 to 60 fc (120 to 640 lux).

2.05 INDOOR OCCUPANCY SENSORS AND VACANCY SENSORS:

A. General Requirements for Sensors: Wall- or ceiling-mounted, solid-state indoor occupancy sensors with a separate power pack.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Operation: Unless otherwise indicated, turn lights on when coverage area is occupied, and turn them off when unoccupied; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
3. Vacancy Sensor: Unless otherwise indicated, lights are manually turned on and sensor turns lights off when the room is unoccupied; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
4. Combination Sensor: Unless otherwise indicated, sensor shall be programmed to turn lights on when coverage area is occupied and turn them off when unoccupied, or to turn off lights that have been manually turned on; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
5. Sensor Output: Contacts rated to operate the connected relay, complying with UL 773A. Sensor is powered from the power pack.
6. Power Pack: Dry contacts rated for 20-A ballast load at 120 and 277Vac. Sensor has 24Vdc, 150-mA, Class 2 power source, as defined by NFPA 70.
7. Mounting:
   a. Sensor: Suitable for mounting in any position on a standard outlet box.
   b. Relay: Externally mounted through a 1/2-inch (13-mm) knockout in a standard electrical enclosure.
   c. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.
8. Indicator: Digital display, to show when motion is detected during testing and normal operation of sensor.
9. Bypass Switch: Override the "on" function in case of sensor failure.
10. Automatic Light-Level Sensor: Adjustable from 2 to 200 fc (21.5 to 2152 lux); turn lights off when selected lighting level is present.

B. Ultrasonic Type: Wall or Ceiling mounted; detect occupants in coverage area through pattern changes of reflected ultrasonic energy .

1. Detector Sensitivity: Detect a person of average size and weight moving not less than 12 inches (305 mm) in either a horizontal or a vertical manner at an approximate speed of 12 inches/s (305 mm/s).
2. Detection Coverage (Small Room): Detect occupancy anywhere within a circular area of 600 sq. ft. (56 sq. m) when mounted on a 96 inch- (2440 mm-) high ceiling.
3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1,000 sq. ft. (93 sq. m) when mounted on a 96 inch- (2440 mm-) high ceiling.
4. Detection Coverage (Large Room): Detect occupancy anywhere within a circular area of 2,000 sq. ft. (186 sq. m) when mounted on a 96 inch- (2440 mm-) high ceiling.
5. Detection Coverage (Corridor): Detect occupancy anywhere within 90 feet (27.4 m) when mounted on a 10 foot- (3 m-) high ceiling in a corridor not wider than 14 feet (4.3 m).

C. Dual-Technology Type: Wall or Ceiling mounted; detect occupants in coverage area using PIR and ultrasonic detection methods. The particular technology or combination of technologies that control on-off functions is selectable in the field by operating controls on unit.
1. Sensitivity Adjustment: Separate for each sensing technology.
2. Detector Sensitivity: Detect occurrences of 6 inch- (150 mm-) minimum movement of any portion of a human body that presents a target of not less than 36 sq. inches (232 sq. cm), and detect a person of average size and weight moving not less than 12 inches (305 mm) in either a horizontal or a vertical manner at an approximate speed of 12 inches/s (305 mm/s).
3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1,000 sq. ft. (93 sq. m) when mounted on a 96 inch- (2440 mm-) high ceiling.

2.06 SWITCHBOX-MOUNTED OCCUPANCY SENSORS:

A. General Requirements for Sensors: Automatic-wall-switch occupancy sensor with manual on-off switch, suitable for mounting in a single gang switchbox.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Operating Ambient Conditions: Dry interior conditions, 32 to 120ºF (0 to 49ºC).
3. Switch Rating: Not less than 800VA LED load at 120V and 1200VA LED load at 277V.

B. Wall-Switch Sensor:
1. Standard Range: 180-degree field of view, field adjustable from 180 to 40 degrees; with a minimum coverage area of 2,100 sq. ft (196 sq. m).
2. Sensing Technology: Dual technology - PIR and ultrasonic.
3. Switch Type: SP, field selectable automatic "on," or manual "on" automatic "off."
4. Voltage: 120V or 277V per drawings.
5. Ambient-Light Override: Concealed, field-adjustable, light-level sensor from 10 to 150 fc (108 to 1600 lux). The switch prevents the lights from turning on when the light level is higher than the set point of the sensor.
6. Concealed, field-adjustable, "off" time-delay selector at up to 30 minutes.
7. Concealed "off" time-delay selector at 30 seconds, and 5, 10, and 20 minutes.
8. Adaptive Technology: Self-adjusting circuitry detects and memorizes usage patterns of the space and helps eliminate false "off" switching.
9. Color: Coordinate with Architect

2.07 LIGHTING CONTACTORS:

A. Description: Electrically operated and electrically held, combination-type lighting contactors with nonfused disconnect, complying with NEMA ICS 2 and UL 508.

1. Current Rating for Switching: Listing or rating consistent with type of load served, including tungsten filament, inductive, and high-inrush ballast (ballast with 15% or less total harmonic distortion of normal load current).
2. Fault Current Withstand Rating: Equal to or exceeding the available fault current at the point of installation.
3. Enclosure: Comply with NEMA 250.

2.08 EMERGENCY SHUNT RELAY:

A. Description: Normally closed, electrically held relay, arranged for wiring in parallel with manual or automatic switching contacts; complying with UL 924.
   1. Coil Rating: 120 or 277V per drawings.

2.09 CONDUCTORS AND CABLES:

A. Power Wiring to Supply Side of Remote-Control Power Sources: Not smaller than No. 12 AWG. Comply with requirements in 26 05 19 – Low voltage Power Conductors and Cables.
B. Classes 2 and 3 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 18 AWG. Comply with requirements in Section 26 05 19 - Low voltage Power Conductors and Cables.
C. Class 1 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 14 AWG. Comply with requirements in Section 26 05 19 - Low voltage Power Conductors and Cables.

2.10 GENERAL DIMMING DEVICE REQUIREMENTS:

A. Compatibility: Dimming control components shall be compatible with other elements of lighting fixtures, ballasts, transformers, and lighting controls.
B. Dimmers and Dimmer Modules: Comply with UL 508.
   1. Audible Noise and Radio-Frequency Interference Suppression: Solid-state dimmers shall operate smoothly over their operating ranges without audible lamp or dimmer noise or radio-frequency interference. Modules shall include integral or external filters to suppress audible noise and radio-frequency interference.
   2. Dimmer or Dimmer-Module Rating: Not less than 125% of connected load unless otherwise indicated.

PART 3 - EXECUTION

3.01 SENSOR INSTALLATION:

A. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, smoke detectors, fire-suppression systems, and partition assemblies.
B. Install and aim sensors in locations to achieve not less than 90% coverage of areas indicated. Do not exceed coverage limits specified in manufacturer's written instructions.

3.02 CONTACTOR INSTALLATION:

A. Mount electrically held lighting contactors with elastomeric isolator pads to eliminate structure-borne vibration, unless contactors are installed in an enclosure with factory-installed vibration isolators.

3.03 WIRING INSTALLATION:

A. Wiring Method: Comply with Section 26 05 19 - Low Voltage Power Conductors and Cables.

B. Wiring within Enclosures: Comply with NECA 1. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.
C. Size conductors according to lighting control device manufacturer's written instructions unless otherwise indicated.
D. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

3.04 GROUNDING:
A. Provide equipment ground connections for lighting control equipment. Tighten connectors to comply with tightening torques specified in UL 486A to assure permanent and effective grounding.

3.05 IDENTIFICATION:
A. Provide equipment grounding connections for lighting control equipment. Tighten connectors to comply with tightening torques specified in UL 486A to assure permanent and effective grounding.
B. Identify components and power and control wiring according to Section 26 05 53 – Identification for Electrical Systems.
1. Identify controlled circuits in lighting contactors.
2. Identify circuits or luminaires controlled by photoelectric and occupancy sensors at each sensor.
C. Label time switches and contactors with a unique designation.

3.06 FIELD QUALITY CONTROL:
A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
1. Continuity tests of circuits.
2. Operational Test: Set and operate controls to demonstrate their functions and capabilities in a methodical sequence that cues and reproduces actual operating functions.
3. Operational Test: After installing time switches and sensors, and after electrical circuitry has been energized, start units to confirm proper unit operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
C. Lighting control devices will be considered defective if they do not pass tests and inspections.
D. Remove and replace malfunctioning modular dimming control components and retest as specified above.
E. Reports: Written reports of tests and observations. Record defective materials and workmanship and unsatisfactory test results. Record repairs and adjustments.

3.07 ADJUSTING:
A. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting sensors to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.
1. For occupancy and motion sensors, verify operation at outer limits of detector range. Set time delay to suit Owner's operations.
2. For daylighting controls, adjust set points and deadband controls to suit Owner's operations.

3.08 PERSONNEL TRAINING:

A. Building Operational Personnel on-site Training: Train Owner's building operating personnel on-site in procedures for starting-up, testing, operating, trouble shooting, servicing and preventive maintenance of the lighting control system equipment for a minimum period of eight hours.

END OF SECTION 26 09 23

SECTION 26 22 13 – LOW-VOLTAGE DISTRIBUTION TRANSFORMERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies transformer work as indicated by Drawings and Schedules.
B. Types of transformers specified in this Section include the following:
   1. Dry-type transformers.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 19 – Low-Voltage Power Conductors and Cable.
B. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
C. Section 26 05 53 – Identification for Electrical Systems.

1.04 REFERENCE STANDARDS:

A. ASTM International (ASTM):
   1. ASTM D877/D877M - Standard Test Method for Dielectric Breakdown Voltage of Insulating Liquids using Disk Electrodes.
   2. ASTM D923 - Standard Practice for Sampling Electrical Insulating Liquids.
B. Code of Federal Regulations (CFR):
   1. 10 CRF Part 429 - Certification, Compliance, and Enforcement for Consumer Products and Commercial and Industrial Equipment.
      a. 429.47 - Distribution Transformers.
   2. 10 CFR Part 431 - Energy Efficiency Program For Certain Commercial and Industrial Equipment, Subpart K – Distribution Transformers.
      a. 431.193 - Test procedures for measuring energy consumption of distribution transformers.
      b. 431.196 - Energy Conservation Standards.
C. Institute of Electrical and Electronics Engineers (IEEE):
   1. IEEE C2 - National Electric Safety Code.
   2. IEEE C57.12.00 - General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers.
   3. IEEE C57.12.01 - General Requirements for Dry-Type Distribution and Power Transformers.
   4. IEEE C57.12.25 - Transformers Pad-Mounted, Compartmental-Type, Self-Cooled, Single-Phase Distribution Transformers with Separable Insulated High-Voltage Connectors; High Voltage, 34,500 GrdY/19,920 Volts and Below; Low Voltage, 240/120 Volts; 167 kVA and Smaller Requirements.
   5. IEEE C57.12.50 - Requirements for Ventilated Dry-Type Distribution Transformers 1 to 500 kVA, Single-Phase, and 15 to 500 kVA, Three-Phase with High-Voltage 601 to 34,500V, Low Voltage 120-600V.
   6. IEEE C57.12.90 - Test Code for Liquid-Immersed, Distribution, Power, and Regulating Transformers.
   7. IEEE C57.12.91 - Test Code for Dry-Type Distribution and Power Transformers.
D. National Electrical Manufacturers Association (NEMA):

1. NEMA ST 20 - Dry-type Transformers for General Applications.
2. NEMA TR 1 - Transformers, Regulators, and Reactors. (Supplements IEEE C57 - Series Standards.)
3. NEMA 250 - Enclosures for Electrical Equipment.

E. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code (NEC). Comply with NEC as applicable to installation and construction of electrical power/distribution transformers.

F. Underwriters Laboratories (UL):
1. Comply with applicable requirements of UL 506 Safety Standard for Specialty Transformers. Provide transformers and components which are UL-listed and labeled.
2. UL 1561 - Dry-Type General Purpose Transformers.

1.05 SUBMITTALS:

A. Refer to Division 01 and Section 26 05 10 – General Electrical Requirements - for administrative and procedural requirements for submittals.

B. Product Data: Submit for each type of product specified and included, with the following as a minimum:
1. Technical product data: Includes, but not limited to, rated kVA, frequency, primary and secondary voltages, wiring diagram, percent taps, polarity, impedance and certification of transformer performance efficiency at 100% load, percentage voltage regulation at 100% load at 75ºC, full-load losses in watts, percent impedance at 75ºC, hot-spot and average temperature rise above 40ºC ambient temperature, sound level in decibels, and standard published data.

C. Shop Drawings: Submit the following as a minimum:
1. Manufacturer's drawings indicating dimensions and weight loadings for transformers and wall brackets.
2. Transformer nameplate data. Include center of gravity information in seismic zones.
3. Wiring Diagrams: Submit wiring and control diagrams for transformers. Clearly differentiate between portions of wiring that are manufacturer factory installed and portions to be field-installed.

D. Submit all field test data.

E. Closeout Submittals: Final documentation shall include:
1. Operation and Maintenance manuals.
2. Certified “As-Built” drawings.
3. Copies of all approved Product Data.
4. Copies of all approved Test Reports.
5. Warranty information.

F. Seismic Qualifications Certificates: Submit certifications that switchboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 26 05 48 – Vibration and Seismic Controls for Electrical Systems.

1.06 QUALITY ASSURANCE:

A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7.

B. Source Limitations: Obtain each transformer type through one source from a single manufacturer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
D. Comply with IEEE C2, National Electric Safety Code.
E. Comply with IEEE C57.12.90, Test Code for Liquid-Immersed, Distribution, Power, and Regulating Transformers. or IEEE C57.12.91, Test Code for Dry-Type Distribution and Power Transformers.
F. Testing procedures shall comply with 10 CFR 429.47 - Distribution Transformers and 10 CFR 431.193 - Test procedures for measuring energy consumption of distribution transformers.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Transformers shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants. Store at secured and insured warehouse location.
B. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.
C. Handle and prepare transformers for installation according to NEMA ST 20 and manufacturer's instructions.

1.08 PROJECT SITE CONDITIONS:

A. Environmental Limitations:
   1. Do not deliver or install transformers until spaces are enclosed and weather tight, any wet work is complete and dry, work above transformers is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
   2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
B. Service Conditions: NEMA ST 20, usual service conditions, as follows:
   1. Ambient temperatures within limits specified.
   2. Altitude not exceeding 3,300 feet.

1.09 WARRANTY:

A. All equipment furnished under this Section shall be warranted by the Contractor and the equipment manufacturer(s) for a minimum period of one year after substantial completion.
B. Warranty shall include all parts, labor, and expenses to perform necessary work.

1.10 COORDINATION:

A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.
B. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Subject to compliance with requirements, provide products of one of the following (for each type of transformer):
   1. ABB.
   2. Eaton.
   3. General Electric Company.

2.02 TRANSFORMERS:

A. General:
   1. Except as otherwise specified or indicated, provide manufacturer's standard materials and components as indicated by published product information, designed and constructed as recommended by manufacturer, and as required for complete installation.
   2. Comply with DOE energy efficiency standards as defined by 10 CFR Part 431.196 – Energy Conservation Standards for all transformers 15 kVA and larger.
   3. Core material shall be grain-oriented, non-aging silicon steel. Coils shall be continuous windings without splices except for taps. Internal coil connections shall be brazed or pressure type. Provide transformers that are constructed to withstand seismic forces specified in Section 26 05 48 – Vibration and Seismic Controls for Electrical Systems. Provide permanent fungicidal treatment for coil and core.
   4. Enclosure ratings shall comply with NEMA 250 – Enclosures for Electrical Equipment.
      a. General Purpose - Ventilated Enclosures.
         (1) Provide NEMA 12 for interior electrical rooms.
         (2) Provide NEMA 4X for exterior locations.
      b. Non-Ventilated Enclosures.
         (1) Provide NEMA 12 enclosures.

B. Dry-Type Transformers (45 kVA or less):
   1. Factory-assembled and tested, general-purpose, air-cooled, dry-type transformers; of sizes, characteristics, and rated capacities indicated.
   2. Single-phase transformer: 480V primary and 240/120V secondary with grounded neutral, 60-hertz, 10 kV BIL.
   3. Three-phase transformer: 480V delta connected primary and 208/120V wye-connected secondary with grounded neutral, 60-hertz, 10 kV BIL.
   4. Aluminum primary and secondary windings. Manufacturer’s standard impedance.
   5. Provide primary winding with 4 full-capacity taps; two 2-1/2% increments below and above full-rated voltage for de-energized tap-changing operation.
   6. Insulate with 220ºC, UL-component-recognized insulation system with a maximum of 150ºC rise above 40ºC ambient temperature.
   7. Rate transformer for continuous operation at rated kVA.
   8. Limit transformer surface temperature rise to maximum of 65ºC.
   9. Provide terminal enclosure, with cover, to accommodate primary and secondary winding connections and raceway connectors.
   10. Equip terminal leads with connectors installed. Limit terminal compartment temperature to 75ºC when transformer is operating continuously at rated load with ambient temperature of 40ºC. Provide wiring connectors suitable for copper wiring.
   11. Cushion-mount transformers with external vibration isolation supports.
   12. Sound-level ratings shall not exceed IEEE/NEMA standards. Conform to NEMA ST 20.

13. Electrically ground core and coils to transformer enclosure by means of flexible metal grounding strap.
14. Provide transformers with ventilated or fully enclosed sheet steel enclosures. Apply manufacturer's standard light gray indoor enamel over cleaned and phosphatized steel enclosure.
15. All transformers shall be suitable for floor mounting unless noted otherwise.
16. Provide wall mounting brackets for wall- or column-mounted transformers.
17. Must comply with IEEE C57.12.01 and/or IEEE C57.12.50.
18. Must comply with UL 1561.

C. Dry-Type Transformers (above 45 kVA):
1. Factory-assembled and tested, general-purpose, ventilated, dry-type transformers; of sizes, characteristics, and rated capacities indicated.
2. Three phase, 480V delta-connected, 10-kV BIL primary; and 208Y/120V 4-wire, 60-hertz, wye-connected secondary with grounded neutral.
3. Provide primary windings with a minimum of 4 full-capacity taps; two 2-1/2% increments above full-rated voltage and two 2-1/2% increments below full-rated voltage for de-energized tap-changing operation.
4. Aluminum primary and secondary windings. Manufacturer's standard impedance.
5. Insulate with 220ºC, UL-component-recognized insulation system with a maximum of 150ºC rise above 40ºC ambient temperature.
6. Rate transformer for continuous operation at rated kVA.
7. Provide terminal enclosure, with hinged cover, to accommodate primary and secondary winding connections and raceway connectors.
8. Provide terminal board with clamp type connectors. Limit terminal compartment temperature to 75ºC when transformer is operating continuously at rated load with ambient temperature of 40ºC. Provide wiring connections suitable for copper wiring.
9. Integrally mount vibration isolation supports between core and coil assembly and transformer enclosure.
10. Electrically ground core and coils to transformer enclosure by means of flexible metal grounding strap.
11. Do not exceed maximum sound-level rating in accordance with IEEE/NEMA standards. Conform to NEMA ST 20.
12. Provide transformers with ventilated steel enclosures and lifting lugs. Apply manufacturer's standard light gray outdoor enamel over cleaned and phosphatized steel enclosure.
13. Provide transformers suitable for floor mounting.
14. Must comply with IEEE C57.12.01 and/or IEEE C57.12.50.
15. Must comply with UL 1561.

D. Equipment/System Identification: Provide equipment/system identification nameplates complying with Section 26 05 53 – "Identification for Electrical Systems."

E. Finishes: Coat interior and exterior surfaces of transformer, including bolted joints, with manufacturer's standard gray baked-on enamel.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.
C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.
D. Verify that ground connections are in place and requirements in Section 26 05 26 – Grounding and Bonding for Electrical Systems have been met. Maximum ground resistance shall be 5 ohms at location of transformer.
E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. Install transformers as indicated, complying with manufacturer's written instructions, applicable requirements of NEC, NESC, NEMA, and IEEE standards in accordance with recognized industry practices to ensure that products fulfill requirements. Arrange equipment to provide adequate space for access and for cooling air circulation.
B. Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torqueing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL 486A.
C. Install wall-mounting transformers level and plumb with wall brackets fabricated by transformer manufacturer. Wall brackets shall meet the environmental requirements of the transformer installation for each location.
    1. Brace wall-mounting transformers as specified in Section 26 05 48 – Vibration and Seismic Controls for Electrical Systems.
D. Construct concrete bases and anchor floor-mounted transformers according to manufacturer's written instructions and seismic codes applicable to Project.

3.03 CONNECTIONS:

A. Provide equipment grounding connections for transformers as specified, indicated, and as required. Tighten connections to comply with tightening torques specified in UL 486A to assure permanent and effective grounding. Provide grounding in accordance with Section 26 05 26 – "Grounding and Bonding for Electrical Systems."

3.04 IDENTIFICATION:

A. Provide identification of transformers as specified in Section 26 05 53 - Identification for Electrical Systems.
B. Nameplates: Label each transformer with a nameplate complying with requirements for identification specified in Section 26 05 53 – Identification for Electrical Systems.

3.05 FIELD QUALITY CONTROL:

A. Tests and Inspections:
    1. Prior to energization of transformers, check all accessible connections for compliance with manufacturer's torque tightening specifications. Clean out any dust and dirt.
    2. Prior to energization, check circuitry for electrical continuity and for short circuits.
    3. Perform insulation resistance test: Megger between high-voltage winding to low-voltage winding, low-voltage winding to ground, and high-voltage winding to ground. Record and submit test results. If readings are below 50 megohms (at 77°F), notify Engineer before energizing transformer.
    4. Perform transformer turns ratio test (TTR) on the full winding and all taps. Record and submit test results.

5. Check cooling fans and controls, where provided, for proper operation.
6. Upon completion of installation of transformers and testing, energize primary circuitry at rated voltage and frequency from normal power source, and test transformers, including, but not limited to, audible sound levels, to demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at the Site then retest to demonstrate compliance; otherwise, remove and replace with new units or components and proceed with retesting.
7. Adjust transformer primary taps for nominal system voltage at initial installation and again when the transformer reaches its designed "full" load condition after occupancy by the Owner. Schedule all required electrical outages with the Owner.

3.06 FINISHES:

A. Equipment coatings shall be free from scratches, rust, or other defects.
B. All damaged or defective coatings shall be repaired prior to final acceptance.
C. Field Painting:
   1. Touch Up:
      a. Contractor shall prepare surfaces and touch up manufacturer applied coatings as required for any damage during shipment and installation.
      b. Field painting shall be performed based on manufacturer’s recommended procedures.
      c. Transformer manufacturer shall furnish Contractor with an adequate quantity of touch-up paint to match the factory applied finish.

3.07 ADJUSTING AND CLEANING:

A. Upon completion of installation, clean interior and exterior of transformers. Remove paint splatters, spots, dirt and debris.

3.08 PROTECTION:

A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until unit is placed into service.

END OF SECTION 26 22 13

SECTION 26 24 13 – SWITCHBOARDS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies switchboard work that is indicated by drawings and schedules.
B. Types of switchboards specified in this Section include the following:
   1. Dead-Front Distribution:
      a. Circuit-breaker switchboards.

1.03 RELATED REQUIREMENTS:

A. Refer to applicable Division 26 Sections for wires/cables, grounding, identification, electrical raceways, fittings, and other items required in connection with switchboards.
B. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
C. Section 26 05 53 – Identification for Electrical Systems.
D. Section 26 05 73 – Power System Studies.
E. Section 26 43 13 – Surge Protection Devices.
F. Section 40 61 96 – Process Control Software Programming and Reports.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
B. American National Standards Institute/Institute of Electrical and Electronic Engineers (ANSI/IEEE):
   1. ANSI/IEEE C37.13 – Low-Voltage AC Power Circuit Breakers Used in Enclosures.
   2. ANSI/IEEE C36.16 – Related Requirements and Application Recommendations for Low-Voltage Power Circuit Breakers and AC Power Protectors, Preferred Ratings.
C. Institute of Electrical and Electronic Engineers (IEEE):
   1. IEEE 241 – Recommended Practice for Electric Power Systems in Commercial Buildings, Pertaining to Switchboards.
D. National Electrical Manufacturers' Association (NEMA):
   1. NEMA PB2 – Dead-Front Distribution Switchboards.
   2. NEMA PB 2.1 – General Instruction for Proper Handling, Installation, Operation, and Maintenance of Dead-Front Distribution Switchboards Rated 600V or Less.
   3. NEMA SG 3 – Low-Voltage Power Circuit Breakers.
E. National Fire Protection Association (NFPA): Comply with applicable local code requirements of the authority having jurisdiction and that portion of the NEC which pertains to installation and construction of switchboards.
   1. NFPA 70 – National Electrical Code (NEC).
   2. NFPA 70E – Standard for Electrical Safety in the Workplaces.
F. Underwriters Laboratories (UL) Compliance: Provide switchboards and components which are UL-listed and labeled.
   1. UL 98 – Enclosed and Dead Front Switches.
   2. UL 486A – Wire Connections and Soldering Lugs for Use in Copper Conductors.
   3. UL 489 – Molded Case Circuit Breakers and Circuit Breaker Enclosures.
   4. UL 891 – Dead Front Electrical Switchboards.

5. UL 977 – Fused Power Circuit Devices.
6. UL 1054 – Ground-Fault Sensing and Relaying Equipment.
7. UL 1449 – Surge Protective Devices.

G. Structural Engineering Institute/American Society of Civil Engineers (SEI/ASCE):
1. SEI/ASCE 7-2002 – Minimum Design Loads for Buildings and other Structures.

1.05 SUBMITTALS:

A. Refer to Division 01 and Section 26 05 10 - General Electrical Requirements for administrative and procedural requirements for submittals.

B. Submittals shall be custom prepared by the switchboard manufacturer for this specific application.

C. Product Data: Submit for each type of product specified and included, with the following as minimum:
1. Data sheets for all components furnished as part of the equipment package. Indicate voltages, number of phases, frequency, short-circuit, and continuous current ratings.
2. Provide application data and time-current trip curves for main and branch circuit-breakers.
3. Instrument transformer performance curves and data.

D. Shop Drawings: Provide the following as minimum:
1. Submit dimensioned drawings of switchboards showing accurately dimensioned equipment sections, including auxiliary compartments, section components, and combination sections.
2. Indicate shipping splits and weight of each section. Complete loading diagrams covering static and dynamic loadings for all conditions of operation and structural steel details. Provide center of gravity information for all seismic rated switchboards. Indicate all required access points for all terminations.
3. Wiring Diagrams: Submit a wiring diagram for the complete switchboard unit showing connections to electrical power feeders, distribution branches, and associated auxiliaries. All external power and control connections shall be clearly identified.
a. Differentiate between portions of wiring that are manufacturer factory-installed and portions that are field-installed.
4. Nameplate schedule.
5. Surge Protective Device data and testing laboratory reports.
6. Coordination Study: Submit a coordination study of the complete electrical distribution system. Provide composite time-current curves. Clearly indicate all device settings and available fault currents. Refer to Section 26 05 73 – Power System Studies.
7. Provide documentation on communication system interface along with a complete list of all available parameters and associated addresses.
8. Provide paper documentation of the programmable logic controller program.

E. Seismic Qualification Certificates: Submit certification that switchboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls for Electrical Systems. Include the following:
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assemble components or on calculation.
2. Dimensioned Outline Drawing of Equipment Unit: Identify center of gravity and locate describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

F. Submit paint manufacturer's certification of VOC compliance and MSDS sheets. Submit certification of paint VOC level compliance as required by local or regional governing authorities.
G. Special Procedure Submittals:
   1. Start-up and commissioning instructions.
   2. Syllabus for Owner training.
H. Test and Evaluation Reports:
   1. Qualification Data: For qualified Installer and Testing Agency.
   2. Factory test reports.
   3. Commissioning and Field test reports.
I. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Operation and maintenance manuals for all components furnished.
      b. Certified "As-Built" drawings of all equipment with information listed above.
      c. Copies of all approved Product Data.
      d. Copies of all approved Test Reports.
      e. Spare parts and supply list with supplier names and part numbers.
      f. Warranty Information.
      g. Manufacturer's service and repair support during and after warranty including contact information.
      h. Training Materials. Includes final edited training videos.
J. Maintenance Material Submittals:
   1. Spare Parts:
      a. Three spare LED indicating lamps for each type and color used.
      b. Three spare indicating light assemblies.
      c. Three spare power and control fuses of each voltage and current rating used.
      d. One 12oz aerosol cans of manufacturer's touch-up paint for each color used. Color shall match the original factory applied color.
      e. All parts supplied with the equipment shall be properly labeled for ease of identification and to permit the shortest possible time to repair.

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use.
B. Factory Tests:
   1. The switchboard assembly shall be completely and functionally tested in the manufacturer's facility prior to shipment. For systems shipped in multiple sections, the switchboard shall be quality tested utilizing the plug-together wiring system which shall be unplugged prior to shipment and plugged together again when the equipment is installed in order to maintain the integrity of the manufacturer's quality assurance testing.
   2. Conduct tests on all system components and subassemblies to assure that all devices and systems are in proper working order before delivery to jobsite.
   3. Automatic Throw-Over System: Simulate actual system operation. Includes simulations of power failure, transfer to emergency source, and re-transfer to normal source.
   4. Submit test reports as specified in Division 01.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Deliver switchboards and components properly packaged and mounted on pallets or skids to facilitate handling of heavy items. Utilize factory-fabricated type containers or wrappings for switchboard and components which protect equipment from damage. Install impact measuring meters in containers which will indicate whether the container has been bumped or dropped. Return impact meters to the manufacturer for reuse upon delivery of switchboards. Inspect equipment to ensure that no damage has occurred during shipment.

B. All necessary hardware for reconnecting shipping splits shall be provided.

C. Store switchboard equipment in original packaging and protect from weather and construction traffic and according to the manufacturer's instructions. Store in a conditioned space to avoid condensation, dust, and other environmental contaminants. Store at secured and insured warehouse location.

D. Handle switchboard equipment carefully to prevent physical damage to equipment and components. Remove packaging, including the opening of crates and containers, avoiding the use of excessive hammering and jarring which would damage the electrical equipment contained therein. Do not install damaged equipment; remove damaged equipment from the site and replace with new.

1.08 SEQUENCING AND SCHEDULING:

A. Schedule delivery of switchboard equipment which permits ready building ingress for large equipment components to their designated installation spaces. Coordinate delivery of equipment with the installation of other building components.

B. Coordinate the size and location of concrete equipment pads. Cast anchor bolt inserts into concrete pad. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.09 PROJECT SITE CONDITIONS:

A. Do not install the switchboard equipment specified herein until designated installation spaces are suitable for intended service.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing the switchboard and shall be maintained for the remainder of the construction period.

1.10 WARRANTY:

A. All equipment furnished under this section shall be warranted by the Contractor and the equipment manufacturer(s) for a minimum period of five years after completion of startup.

B. Warranty shall include all parts, labor, and expenses to perform necessary work.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Subject to compliance with requirements, provide switchboard units of one of the following for each type, and rating of switchboard:

1. Eaton Corporation.
2. General Electric, ABB Inc.
3. Siemens Corporation.
4. Schneider Electric.

2.02 EQUIPMENT SECTIONS AND COMPONENTS:

A. General: Except as otherwise indicated, provide switchboards and ancillary components of types, sizes, characteristics, and ratings indicated which comply with manufacturer's standard design, materials, components, and construction, in accordance with published product information, and as required for complete installation. Provide terminals UL rated for 75ºC (minimum) conductors.

B. Seismic Performance: Switchboards shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.

C. AC Dead-Front Distribution Switchboards:
   1. Factory-assembled, dead-front, metal-enclosed, self-supporting secondary power switchboards, of types, sizes, electrical ratings, and characteristics indicated.
   2. Assemblies consisting of vertical panel units and containing circuit-breakers assemblies of quantities, ratings, and types indicated.
   3. Provide tin-plated copper main bus with connections to switching devices and circuit-breaker branches of sufficient capacity to limit rated continuous current operating temperature rise to no greater than 65ºC above average ambient temperature of 40ºC.
      a. Copper bus current density shall not exceed 1,000 amperes per square inch.
   4. Main bus and tap connections shall be plated and bolted tightly according to manufacturer's torquing requirements for maximum conductivity.
   5. Brace bus for short-circuit stresses greater than or equal to the minimum interrupting capacity indicated.
   6. Provide accessibility of line and load terminations from front of switchboard.
   7. Provide equipment with built-in lifting eyes and yokes.
   8. Provide vertical individual panel units, suitable for bolting together at project site.
   9. Construct switchboard enclosures suitable for the following environment:
      a. Installation: Indoors, NEMA Type 1.

D. Enclosures: Construct dead-front switchboards suitable for floor mounting, with front cabling/wiring accessibility and conduit accessibility as required. Provide welded steel channel framework; hinge front wireway covers to permit ready access to branch circuit-breaker load side terminals. Enclosure shall be suitable for being rolled or pushed into final location. Coat enclosures with manufacturer's standard corrosive-resistant finish.

E. Finish:
   1. Paint system with manufacturer's standard coating system suitable for intended service.
   2. Coating systems shall not contain any lead (0.00%), zinc or strontium chromates, mercury or mercury compounds, or asbestos. Coatings shall also be VOC compliant to meet the VOC level as required by the local or regional governing authorities. Equipment Manufacturers shall submit certification by coating manufacturers, including MSDS sheets, verifying these requirements.
   3. Exterior paint color shall be light gray.
   4. Provide factory-painted white mimic bus on front of each switchboard.

F. Nameplates:
   1. Wording and equipment tags as indicated.
   2. Engraved phenolic nameplates for each circuit breaker unit and other equipment units included in the assembly.
   3. Engraved phenolic "master" nameplate for each switchboard.
   4. Refer to Section 26 05 53 – Identification for Electrical Systems for additional labeling requirements.

G. Circuit Breakers: Except as otherwise indicated, provide circuit breakers and ancillary components, of types, sizes, ratings and electrical characteristics indicated, which comply with

manufacturer's standard design, materials, components, and construction in accordance with published product information and as required for a complete installation.

1. Insulated Case Circuit Breakers (Main) :
    a. Factory-assembled, electronically operated, insulated case circuit breakers
    b. Frame size and trip rating as indicated. 600Vac, 60 Hz, 3-phase, 3-pole, back connected, 100% continuous current rated, continuous current rating indicated, RMS symmetrical amperes interrupting capacity rating indicated.
    c. Provide fixed breaker elements with NEMA Type 1 general purpose enclosures.
    d. Construct with ground-fault protection sensors.
    e. Equip circuit breakers with solid-state controls and programming units possessing the following operating features:
        (1) Adjustable current, long time pickup and delay.
        (2) Adjustable current, short time pickup and delay.
        (3) Adjustable current, instantaneous pickup and delay.
        (4) Adjustable ground-fault time pickup and delay.
        (5) I^2t settings for instantaneous and ground fault.
        (6) Overload, short-circuit, and ground-fault target indicators.
        (7) Circuit Breaker Accessories: Provide the following insulated case circuit circuit-breaker accessories.
            (a) Shunt trip.
            (b) Undervoltage release.
            (c) Bell alarm with lockout.
            (d) Auxiliary contacts for Open/Close.
            (e) Communication Capability: ETHERNET/IP.
2. Molded-Case Circuit Breakers (Feeders):
    a. Factory-assembled, molded-case, manually-operated.
    b. Frame sizes and ampere rating as indicated, 600V, 60 Hz, 3 poles with RMS symmetrical interrupting ratings indicated.
    c. Provide breakers with permanent thermal and instantaneous magnetic trips in each pole and ampere ratings as indicated.
    d. Construct with overcenter, trip-free, toggle-type operating mechanisms with quick-make, quick-break action and positive handle trip indication.
    e. External handle clearly indicates when breaker is "ON," "OFF," or "TRIPPED," and lockable in the "OFF" position.
    f. Provide push-to-trip button on enclosure cover for mechanical tripping circuit breakers.
    g. Construct breakers for mounting in any physical position and operating in an ambient temperature of 40ºC.
    h. Provide breakers with mechanical screw type removable connector lugs, AL/CU rated.
    i. Breaker Accessories: Provide the following molded-case breaker accessories:
        (1) Shunt trip.
        (2) Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
        (3) Auxiliary contacts.
        (4) Alarm switch.
        (5) Undervoltage trip.

(6) Communication Capability: Circuit-breaker-mounted communication module with functions and features compatible with power monitoring and control system.

H. Provide an arc energy-reducing maintenance switch with a local status indicator for circuit breakers that meets requirements of the NEC where indicated on plans.

I. Switchboard Bus: Provide switchboard busing with sufficient cross-sectional area to fulfill UL 891 pertaining to temperature rise. Bus shall be continuous rated amperes as required. Construct through-bus of tin-plated copper (with silver-plated connections), with ampacity rating indicated, and with short-circuit current rating indicated. Provide fully rated main bus (tapered bus is not acceptable). Provide full capacity neutral bus. Provide ground bus full length of switchboard, firmly connected to each vertical section of the switchboard.

J. Metering:

1. Provide metering compartments, CTs, PTs, kWh meter, and instrument phase selector switches. Mount meters semi-recessed in front doors and install meter wiring and lacing with sufficient flexibility at hinged edge of meter front mounting plates to prevent damage. Provide the following metering devices where indicated.
   a. Instrument Transformers: IEEE C57.13, NEMA EI 21.1, and the following:
   b. Potential Transformers: IEEE C57.13; 120 V, 60 Hz, secondary; disconnecting type with integral fuse mountings. Burden and accuracy shall be consistent with connected metering and relay devices.
      (1) Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary; wound and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
      (2) Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.
      (3) Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main circuit breaker.
   c. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
2. Push-Button-selectable digital display of the following values with maximum accuracy tolerances as indicated:
   a). Phase Currents, Each Phase: ±1%.
   b). Phase-to-Phase Voltages, Three Phase: ±1%.
   c). Phase-to-Neutral Voltages, Three Phase: ±1%.
   d). Megawatts: ±2%.
   e). Megavars: ±2%.
   f). Power Factor: ±2%.
   g). Frequency: ±0.5%.
   h). Accumulated Energy, kWh: ±2%; accumulated values unaffected by power outages up to 72 hours.

K. Ground-Fault Protectors: Solid-state, ground-fault protection units of types and ratings indicated: equip with static relays, sensors, pilot lights, and push-buttons for fault indication, test, and reset; include fuse blocks, fuses, and control power transformers. Provide system which operates at 120Vac.

L. System Coordination: Provide settings for all adjustable trips such that the electrical system and switchboard devices are all selectively coordinated. Coordinate with Section 26 05 73 – Power System Studies.

M. Space Heaters:

1. Provide factory-installed differential thermostat controlled space heaters in each vertical section.
2. Space heaters shall be sized to prevent condensation within the enclosure.
3. Power space heaters internally to switchboard.
4. Provide required control power transformer and overcurrent protection for space heaters.

2.03 SURGE PROTECTIVE DEVICES (SPD):

A. Switchboard shall be provided with an integral Surge Protective Device (SPD) as indicated. Refer to Section 26 43 13 – Surge Protection Devices for requirements.

2.04 AUTOMATIC TRANSFER CONTROLS:

A. A service entrance rated automatic throw-over system shall be provided in the switchboard assembly and serve as the main switching device for the switchboard line-up.

B. The automatic throw-over system shall be rated as follows:
   1. Designed for 480V, 3-phase, 4 wire, amp rating as indicated.
   2. Shall be 100% equipment rated for continuous duty.
   3. Shall be listed as service entrance equipment.

C. Construction:
   1. The throw-over system shall consist of completely enclosed circuit breaker assemblies and a separate logic controller mounted in the switchboard assembly.
   2. Switchboard shall be provided with a redundant, 24Vdc power system to power network equipment, communications, control boards, and logic controllers.
      a. A minimum of two full capacity 120Vac to 24Vdc power supplies shall be provided for each switchboard. Each power supply shall be provided with a dedicated input circuit breaker and shall each be powered from a separately derived 120Vac source outside of the switchboard. Field terminal blocks shall be provided for this external power source.
      b. Each power supply shall be sized to accommodate all connected components plus a minimum of 20% spare capacity.
      c. A failure contact shall be provided from each power supply and wired to the switchgear PLC. Contact shall be rated a minimum of 3 Amps at 120Vac. Provide interposing relay if required.
   3. The transfer switch shall be capable of open transition operation. Operator selection shall be made available for this function.
   4. In the event of automatic transfer controller failure, electrical interlocking outside the PLC shall utilize breaker auxiliary contacts to logically prevent all three breakers (2 mains and 1 generator) from being closed at the same time.
      a. When the Auto/Manual switch is in Manual position, breaker control buttons shall be operable and protective interlocks including non-paralleling, non-reclosure onto a fault, and voltage protection shall remain intact. Breakers shall not close automatically. Utility breakers shall not close unless voltage is available on the line side.
   5. The transfer switch shall be capable of being operated manually under full rated load conditions. Manual operation shall be accomplished by a permanently attached manual operator, or by integrally mounted pushbuttons. Removable manual operating handles, and handles that may move in the event of an electrical operation during the manual operation, are not acceptable. Manual operators requiring source or load disconnection prior to manual operation are not acceptable.

6. An external key-operated selector switch shall be provided to provide disconnect and lock-out functionality of the Utility and Generator main breakers. Indicators shall be provided to show the availability of each source as well as breakers in a tripped or disconnected position.
7. Provide neutral disconnect link for three-pole solid neutral-to-ground main bonding jumper for all switches to meet UL service entrance requirements. Ground fault protection shall be provided in accordance with NFPA 70 Article 230-95.
8. The scheme of operation shall be controlled by a microprocessor-based programmable logic controller. The controller shall be hardened against potential problems from transients and surges. Operation and monitoring of both sources, input and output functions, and communications to the plant control system shall be managed by the controller.

D. Programmable Logic Controller (PLC):
1. The PLC shall be mounted in the switchboard instrument section and shall provide the operator with an overview of the transfer stats, parameters, and diagnostic data.
2. The PLC based control system shall include an HMI touchscreen mounted on the face of the switchboard instrument section for operator interface. The touchscreen shall be color, 12” inch (minimum diagonal) TFT LCD industrial display capable of displaying both text and graphics. The display shall support a minimum resolution of 800x600 pixels, 16 million colors. The HMI shall display the following as minimum:
   a. Main Menu Screen with a complete listing of major screens.
   b. System Overview Screen with a dynamic graphic display of the electrical one-line.
   c. System Control and Metering Screens with graphical presentations of all functions specified and minimum metered points as follows.
      (1) Line-to-line and line-to-neutral voltages for each source and the load.
      (2) Line frequency for each source and the load.
      (3) Load indication in kW and kVA.
      (4) Power factor.
      (5) Load current (per phase).
   d. Utility Screen that contains all of the adjustments and delays specified.
   e. Annunciation Screen that contains all of the status and alarm points for the system.
   f. Alarm Summary Screen that contains a time/date stamped system alarm summary.
   g. Password Entry Screen that contains a soft keyboard/keypad for password entry.
   h. Timer countdown for each time delay while functioning.
   i. Real-time clock.
3. The transfer switch interfaces shall include individual LED indicators and touchscreen indication of the following:
   a. Source 1 available.
   b. Source 1 connected.
   c. Source 2 available.
   d. Source 2 connected.
   e. System status.
   f. Source 3 available.
   g. Source 3 connected.

E. The automatic throw-over system shall be open transition only and contain the following features:
1. Password programming protection.
2. Set points shall be stored in Non-Volatile memory, and use of an external battery source to maintain operation during "dead" periods shall not be required.

3. Provision shall be made for manual transfer capabilities in the event of a PLC/HMI display failure.
4. The voltage of each phase of the normal source and the alternate source shall be monitored, with undervoltage dropout adjustable from 50% to 97% of nominal and pickup adjustable from dropout setting ±2% to 99% of nominal.
5. The voltage of each phase of the normal source and the alternate source shall be monitored, with overvoltage dropout adjustable from 105% to 120% of nominal and pickup adjustable from dropout setting +2% to 103% of nominal.
6. The frequency of the normal source and the alternate source shall be monitored, with underfrequency dropout adjustable from 90% to 97% of nominal and pickup adjustable from dropout setting +1 Hz to 99% of nominal.
7. The frequency of the normal source and the alternate source shall be monitored, with overfrequency dropout adjustable from 103% to 110% of nominal and pickup adjustable from dropout setting +1 Hz to 101% of nominal.
8. A time delay shall be provided to override a momentary power outage or voltage fluctuation, adjustable from 0 to 120 seconds.
9. A time delay shall be provided on transfer to source 2, adjustable from 1 to 1800 seconds.
10. A time delay shall be provided on retransfer from source 1 to source 2, adjustable from 0 to 1800 seconds. This time delay shall be bypassed if emergency source fails and normal source is available.
11. All delays shall be field adjustable from the operator touchscreen interface without the use of special software or tools.
12. Retransfer mode, selectable - manual or automatic from source 1 to source 2.

F. The automatic transfer controller shall contain the following input/outputs:
1. Minimum of six (6) SPDT contact outputs for control functions, rated 5A, 250Vac.
2. The logic controller input/output contacts shall function as specified and described as follows:
    a. Output contact for transfer switch fail alarm.
    b. Output contact for Breaker in Utility position.
    c. Output contact for Utility source available.
    d. Output contact for control power failure (Energized open, fail closed).
3. Provide one SPDT contact output for common alarm as minimum, rated 5A, 250Vac.

G. Annunciation
1. The system shall be provided with HMI annunciation in accordance with NFPA 110 requirements.
2. The annunciation system shall be equipped with a fast pulse horn (rated 80-95 dbA at three feet), a horn silence push-button, and acknowledge push-button. Any system alarm conditions shall cause the horn to sound until the horn silence button is depressed. Any subsequent alarms shall re-sound the alarm horn. The display shall operate such that any alarm point shall “flash” until acknowledged.
3. As minimum the following annunciation points shall be provided.
    a. Utility control not in Auto.
    b. Utility Circuit Breaker Failed to Close/Open.
    c. Utility Circuit Breaker Tripped.
    d. Controller Fault.

H. Description of Operation:
1. Automatic Transfer System (ATS):

a. The ATS shall be capable of being controlled in MANUAL at its HMI located on the switchboard or automatically by the controller when the MANUAL/AUTO function is in AUTO.

b. Manual Control:
   (1) When the ATS is in MANUAL control, opening and closing of the utility and generator source breakers shall be controlled at the switchboard HMI or by pushbuttons and switches located on the face of the switchboard.
      (a) Screen OPEN/CLOSE pushbuttons shall be provided on the switchboard HMI for opening and closing the primary and secondary source, main breakers.
      (b) Pushbuttons and switches shall be provided on the switchboard face to disengage the controller and to allow the main breakers to be controlled manually if the HMI or controller fails. There shall be an interlock between the utility and generator main breakers to prevent both source breakers from being closed at the same time.
      (c) Additional manual operations shall be provided as recommended by the manufacturer and as specified.

c. Automatic Control:
   (1) When in AUTO control, opening and closing of the primary and secondary main breakers shall be controlled by the ATS controller.
   (2) Sequence of Operation:
      (a) Normal Conditions:
         1). The utility main breaker one is closed.
         2). The generator breaker is open.
         3). The utility main breaker two is open.
         4). The MANUAL/AUTO switch is in the “AUTO” position.
      (b) Source 1 Power Failure:
         1). If an undervoltage, phase imbalance, or phase reversal is detected by the ATS equipment the primary main breaker one will open after an operator adjustable time delay, initially set at 1 second.
         2). Utility main breaker two will close.
         3). Source 1 and 2 failure, utility beaker one and two open. Operator place system in manual mode and manually close the generator circuit breaker.
      (c) Utility Source One Returns:
         1). When normal utility 1 is detected by the ATS equipment and the source stabilization delay (adjustable) has expired, a utility annunciation shall be provided.
         2). After verifying a utility source has become available, the operator will manually open the generator breaker and put the system into AUTO mode. Utility main breaker one shall close.
      (d) Loss of Power Simulation (Transfer Test) utility Source 1 to 2:
         1). Test switches shall be provided to simulate a main power failure.
         2). The operator will initiate a test by actuating the appropriate test switch to TEST mode.
         3). The test mode shall create an undervoltage condition and be detected by the associated undervoltage relay.
         4). The sequence of the test should follow the conditions of a Utility Power Failure as described in Part (b) above.

5). To end the transfer test the operator will return the test switch to the NORMAL position.
6). The sequence of the retransfer to primary power should follow the conditions of a Primary Power Returns as described in Part (c).

d. The ATS equipment status points and alarms shall be displayed on the operator workstation and Switchboard HMI. Refer to the I/O list in controls specification for I/O status and alarm points to be transmitted to the plant control system.

I. System Upsets and Procedures for Recovery:
1. In the event the ATS controller fails or senses a failure of the system the associated alarms shall be displayed on the switchboard HMI and alarm conditions shall be communicated to the plant control system via the EtherNet/IP network.

2.05 PLANT CONTROL SYSTEM (PCS) INTERFACE:

A. The switchboard system shall provide a network interface for the plant control system (PCS).
B. The interface shall be designed such that the PCS or external user interface can in no way compromise the integrity or interfere with the critical operations of the switchboard and the Automatic Throw-over System.
C. The communications protocol to the PCS shall be via EtherNet/IP.
1. A single Category 6 cable connection shall be used for this interface.
D. Refer to Section 40 61 96 – Process Control Software Programming and Reports for a control description of the PCS interfaces. Refer to the I/O list at the end of Section 40 61 96 for a complete list of required I/O points communicated with the PCS.
E. The system manufacturer shall prepare all points for consumption by the plant control system PLC and provide the necessary documentation and technical support for the Systems Integrator to fully integrate the system.

2.06 INFRARED (IR) WINDOWS

A. Flir Infrared (IR) Windows: Provide two factory-installed infrared (IR) Flir or engineer approved Equal windows per switchboard section. Factory located IR windows for maximum viewing of bus, conductor, breaker, and other termination points.

2.07 VOLTAGE INDICATING DEVICES AND VOLTAGE TEST PORTALS

A. Provide combination LED voltage indicating device and absence of voltage test portal for volt meter probes at each switchboard section, MCC section and panelboard section. Manufacturer shall be Grace Technologies PSED Combination Unit or engineer approved equal. Devices shall be factory installed into switchboard, MCC and panelboard sections.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and conditions under which switchboards and components are to be installed. Do not proceed with the work until unsatisfactory conditions have been corrected.
B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing the switchboard and shall be maintained for the remainder of the construction period.

3.02 INSTALLATION OF SWITCHBOARDS:

A. Install switchboards as indicated, in accordance with manufacturer's written instructions, and with recognized industry practices.

B. Comply with applicable requirements of NEC, NEMA PB 2.1, and NECA's "Standard of Installation." Provide seismic support and bracing to resist the forces of a Seismic event without damage.
C. Provide all openings in floors, walls, roofs, and other structures necessary for complete equipment installation, unless such openings are specifically indicated as being provided by others. Include openings through floors for future cables to connect to spare breakers and to spaces provided in equipment for future expansion.
D. Install a 4-inch high concrete equipment pad 4 inches wider and 4 inches deeper than the switchboard.
E. Level, shim, and anchor to floor or wall with bolts or concrete anchors.
F. Install all necessary wiring or interconnections as required.
G. Make all internal and external connections as indicated and as required by manufacturer's wiring diagrams.
H. Check all internal and external connections, especially current transformer secondary short circuiting jumpers, and tighten as required.
I. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL 486A and the National Electrical Code.
J. Grounding:
    1. Provide equipment grounding connections for switchboards as indicated. Tighten connections to comply with tightening torques specified in UL 486A to assure permanent and effective grounds.
    2. Test for ground continuity. Test neutral continuity to grounded point of derived system.
K. Identification:
    1. Provide switchboard identification as specified in Section 26 05 53 - Identification for Electrical Systems.
    2. Provide switchboard with nameplate indicating designation, incoming line circuit number, voltage, and number of phases. Provide typed circuit directory indicating circuit number and load served. Provide each overcurrent device with a corresponding adhesive label with associated number and load served as indicated.
    3. Place arc flash label on equipment.
L. Place Dow Corning 3-6548 Silicone RTV or General Electric RTF762 sealant in the following locations:
    1. All holes in concrete walls, floors and roof slabs after installation of conduit.
    2. All unused holes and sleeves as approved by Resident Project Representative.

3.03 FIELD QUALITY CONTROL:

A. Manufacturer’s Field Services:
    1. Manufacturer's field service shall be provided as specified in this Section and in Division 01.
    2. Switchboard manufacturer shall provide the field services of a factory technician for a minimum of 3 day(s) on 3 separate occasions to supervise/inspect installation, test and start-up all equipment provided. All travel and living expenses shall be included. All equipment required for testing, start-up and performance verification shall be provided by the start-up technician.
    3. Additional days and trips shall be provided as required to fully complete field testing, startup, and training as specified.

4. The switchboard manufacturer shall provide a factory technician specializing in Ethernet/IP communication as part of the start-up field services. All equipment required for setup and configuration shall be provided by the technician. The technician shall be available to assist the Systems Integrator in setup and configuration of the plant control system network connections to the switchboard and associated network connected devices.

B. Field Testing:
1. Perform "start-up" tests as recommended by manufacturer.
2. Prior to energization of circuitry, check all accessible connections to manufacturer's torque tightening specifications.
3. Prior to energization, check for electrical continuity of circuits and for short-circuits.
4. Prior to energization check with an insulation resistance tester: phase-to-phase and phase-to-ground insulation resistance levels to ensure requirements are fulfilled. Record and submit field test data.
5. Configure networked equipment for proper communication on the Ethernet/IP PCS network.
6. Test network communication to all network connected electronic meters, trip units, and logic controllers and verify the overload device is responding to commands and reporting statuses properly to the plant control system.
7. The manufacturer's representative shall perform field adjustments of the protective devices as required to place the equipment in final operating condition. The settings shall be in accordance with the approved short-circuit study, protective device evaluation study, and protective device coordination study.
8. Automatic Throw-Over System Tests: Simulate actual system operation. Includes, but is not limited to, simulations of power failure, transfer to emergency source, and re-transfer to normal source.

C. Additional Field Testing:
1. Provide additional field testing as required by switchboard manufacturer.

D. Submit field testing and commissioning reports as specified in Division 01.

3.04 FINISHES:

A. Equipment coatings shall be free from scratches, rust, or other defects.
B. All damaged or defective coatings shall be repaired prior to final acceptance.
C. Field Painting:
1. Touch Up:
a. Contractor shall prepare surfaces and touch up manufacturer applied coatings as required for any damage during shipment and installation.
b. Field painting shall be performed based on manufacturer's recommended procedures.
c. Switchboard manufacturer shall furnish Contractor with an adequate quantity of touch-up paint to match the factory applied finish.

3.05 ADJUSTING AND CLEANING:

A. Adjust operating mechanisms for free mechanical movement.
B. After field installation and final wiring terminations are completed the field connected power and control wiring and cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.
C. Prior to final acceptance the switchboard interior and exterior shall be wiped clean and free from dust and debris.

3.06 DEMONSTRATIONS:

A. Subsequent to installation of switchboard and all main, feeder, and branch circuit wire and cable hook-ups, energize switchboards and demonstrate functioning in accordance with requirements.
B. Demonstrate the automatic throw-over system in both automatic and manual mode.
C. Where necessary, correct malfunctioning units and then retest to demonstrate compliance.

3.07 TRAINING:

A. The switchboard manufacturer shall provide a qualified representative for a minimum of one day of training at the customer's facility for operations, maintenance and service personnel.
    1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
    2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, programming, setup, configuration, operational indicators, faults, diagnostic tools, troubleshooting, and preventive maintenance.
    3. Hands-on training shall be provided on the equipment.
    4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.
B. The Owner at their option shall be allowed to video record all training sessions for future reference.
C. Contractor shall record the training sessions and provide a final edited version to the Owner on a DVD-ROM and electronic video file format.

END OF SECTION 26 24 13

SECTION 26 24 14 – DOCKING STATION FOR PORTABLE GENERATOR

PART 1 - GENERAL

1.01 SUBMITTALS

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

1.02 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
B. ETL/UL LISTED to 1008 Standards
C. UL 50 LISTED

1.03 COORDINATION

A. Coordinate layout and installation of Generator Docking Station, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels

1.04 GUARANTEE/WARRANTY

A. Manufacturer Warranty shall be provided for a minimum of 1 Year.
B. The equipment installed under this contract shall be left in proper working order
C. New materials and equipment shall be guaranteed against defects in composition, design or workmanship. Guarantee certificates shall be furnished.

PART 2 - PRODUCTS

2.01 DOCKING STATION

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
    1. TRYSTAR: Docking Station.
    2. Eaton.
    3. Square D.
    4. ABB.

2.02 GENERAL REQUIREMENTS

A. Enclosure
    1. NEMA 4X Rain-Tight Stainless Steel Enclosure
        a. Pad-lockable front door shall include a hinged access plate at the bottom for entry of temporary cabling that prevents unauthorized tampering while in use.
        b. NEMA 4X Integrity shall be maintained while temporary cabling is connected during use
        c. Front and Side shall be accessible for maintenance
        d. Top, Side, and Bottom shall be accessible for permanent cabling
B. Phase, Neutral, and Ground Busbar
    1. Material: Tin-plated Copper
    2. Equipment Ground Bus: bonded to box.
    3. Isolated Ground Bus: insulated from box.
    4. Ground Bus: 100% of phase size.
    5. Neutral Bus: Neutral bus rated 100 percent of phase bus.

C. Temporary generator connectors shall be Camlok style mounted on gland plate.
   1. Camlok shall be 16 Series model and color coded according to system voltage requirements.
   2. Camlok connections shall be Bus Bar Style, Cabling or Double Set Screw is not acceptable
   3. Camlok connection shall be protected against accidental contact while not in use
D. Permanent Connection shall be factory installed broad range set-screw mechanical type, located behind a physical barrier
E. Short Circuit & Withstand Rating
   1. Shall be minimum 65 KAIC unless otherwise indicated on drawings
F. Voltage & Amperage
   1. 480/277V, 3Ø, 4W, amperage as indicated on plans.
G. Factory Installed Phase Rotation Monitor Device:
   1. Phase monitoring relay to be Siemens 3U4512-1AR20 or equal and factory installed
H. Additional accessories shall be included in submittal drawing as follows:
   1. Battery Charger Receptacle 20A GFCI 125V.
   2. Block Heater Receptacle 30A L5-30 125V.
   3. 50A Twist-Lock 125V/250V.
   4. Kirk Key Door Interlock.
   5. Listed Monitoring Device.
   6. Strip Heater & Thermostat.
   7. Utility Light/Alarm.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine elements and surfaces to receive Generator Docking Station for compliance with installation tolerances and other conditions affecting performance of the Work.
B. Proceed with installation only after unsatisfactory conditions have been corrected

3.02 INSTALLATION

A. Surface, Flush or Base Mounted: Determined by Application
   1. Install anchor bolts to elevations required for proper attachment to Generator Docking Station.

3.03 IDENTIFICATION

A. Comply with requirements in Section 26 05 53 Identification for Electrical Systems.
B. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
C. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.04 FACTORY COMMISSIONING

A. Upon completion of the installation, the docking station shall be commissioned by the Manufacturer's factory authorized technician.
B. Scope of work shall include:
   1. Review and verify the installation of all Trystar components and verify the correct electrical flow as depicted on the one-line drawings.
   2. Factory training for on-site personnel to educate them on how to connect the GDS to a portable generator

3. The Manufacturer's factory authorized technician shall, upon completion of the commissioning provide a written report to the electrical contractor and electrical engineer indicating the completion of the work.
4. Any issue that is found during the start-up that is determined at that time to be a warranty issue will be covered by Manufacturer. Any issues that are specific to the scope for the electrical installing contractor are the sole responsibility of the installing contractor.
5. Upon successful completion of the commissioning, provide a complimentary 12-month warranty extension, above and beyond the 12-month manufacturer warranty.

3.05 FIELD QUALITY CONTROL

A. Third Party Tests and Inspections to include the following:
   1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

B. Prepare test and inspection reports, including a certified report that identifies Generator Docking Station and that describes scanning results.

END OF SECTION 26 24 14

SECTION 26 24 16 – PANELBOARDS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies panelboards including cabinets and boxes, as indicated by Drawings and Schedules, and as specified herein.

B. Types of panelboards and enclosures required for the Project include the following:

1. Service entrance panelboards.
2. Distribution panelboards.
3. Lighting and appliance branch-circuit panelboards.
4. Mini-power centers.

1.03 RELATED REQUIREMENTS:

A. Other Division 26 Sections for wires/cables, electrical boxes, fittings, and raceways required in conjunction with the installation of panelboards and enclosures.

B. Section 26 05 26 – Grounding and Bonding for Electrical Systems.

C. Section 26 05 53 – Identification for Electrical Systems.

D. Section 26 43 13 – Surge Protection Devices.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with the latest standards revision in effect as of the date of the Contract Documents unless otherwise indicated.

B. Institute of Electrical and Electronic Engineers (IEEE):

1. IEEE C62.41.1 – Surge Environment in Low-Voltage (1000V and less) AC Power Circuits.
2. IEEE C62.41.2 – Characterization of Surges in Low-Voltage (1000V and less) AC Power Circuits.
3. IEEE C62.45 – Surge Testing on Equipment Connected to Low Voltage (1000V and less) AC Power Circuits.
4. IEEE C62.62 – Test Specification for Surge Protective Devices for Low Voltage AC Power Circuitry.

C. National Electrical Manufacturers Association (NEMA):

1. NEMA 250 – Enclosures for Electrical Equipment (1,000V Maximum).
2. NEMA PB 1 – Panelboards.
3. NEMA PB 1.1 – General Instructions for Proper Installation, Operation, and Maintenance of Panelboards Rated 600V or Less.
4. NEMA PB 2.2 – Application Guide for Ground-Fault Protective Devices for Equipment.
5. NEMA ST 20 – Dry Type Transformers for General Applications.

D. InterNational Electrical Testing Association:

1. NETA ATS – Acceptance Testing Specifications for Electrical Power Equipment and Systems.

E. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC): Comply with applicable local code requirements of the authority having jurisdiction and NEC as applicable to installation and construction of electrical panelboards and enclosures.

F. Underwriters Laboratories (UL): Provide panelboard units which are UL listed and labeled.
   1. UL 50 - Electrical Cabinets and Boxes.
   2. UL 67 - Electrical Panelboards.
   3. UL 486A - Wire Connectors and Soldering Lugs for Use with Copper Conductors.
   4. UL 489 - Molded-Case Circuit Breakers and Circuit Breaker Enclosures.
   5. UL 869A - Electrical Service Equipment.
   6. UL 1053 - Ground-Fault Sensing and Relaying Equipment.
   7. 1283 – Electromagnetic Interference Filters.
   8. 1449 – Safety for Surge Protective Devices.
   9. Special Use Markings: Provide panelboards constructed for special use with appropriate UL markings which indicate that they are "Suitable for Use as Service Equipment" where applicable.

1.05 PERFORMANCE REQUIREMENTS:

A. Seismic Performance: Panelboards shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.
   1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces or short circuit currents specified and the unit will be fully operational after the seismic event."

1.06 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

B. Submittals shall be custom prepared by the panelboard manufacturer for this specific application.

C. Product Data: Submit for each type of product specified and included, with the following as a minimum:
   1. Data sheets for all components furnished as part of the system package.

D. Shop Drawings: Provide the following as a minimum:
   1. Panelboard dimensions and weight. Provide center-of-gravity information for each seismic rated panelboard.
   2. Complete data on circuit breakers. Submit time - current characteristic curves of all devices.
   3. Panelboard short-circuit interrupting capacity, and information on buses: Phase, neutral, and ground.
   4. Information on whether panelboard is fed from top or bottom.
   5. Data on maximum and minimum incoming and outgoing feeder and branch circuit wire size.
   6. Data on door, locks, and mounting: Surface or flush.
   7. Data on total number of poles and number of unused poles that is available for future use.

E. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Operation and maintenance manuals for all components furnished.
      b. Certified “As-Built” drawings of all equipment with information listed above.
      c. Copies of all approved Product Data.

d. Copies of all approved Test Reports.
e. Warranty Information.

F. Maintenance Material Submittals:
1. Furnish extra materials and spare parts that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
a. Keys: Two spares for each type of panelboard cabinet lock.

1.07 QUALITY ASSURANCE:

A. Testing Agency Qualifications: Member company of NETA or a NRTL.
1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

B. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use for at least one year prior to Bid opening.

C. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

D. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

F. Panelboards shall comply with NEMA PB 1.

G. Comply with NFPA 70.

H. Mini-power centers shall conform to the applicable requirements of 10 CFR 429.47 – Distribution Transformers and 10 CFR 431.193 – Test procedures for measuring energy consumption of distribution transformers.

1.08 DELIVERY, STORAGE, AND HANDLING:

A. Panelboards shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants. Store at secured and insured warehouse location.

B. Handle and prepare panelboards for installation according to NEMA PB 1 and manufacturer's instructions.

1.09 PROJECT SITE CONDITIONS:

A. Environmental Limitations:
1. Do not deliver or install panelboards until spaces are enclosed, weathertight, dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
2. Service Conditions: Rate equipment for continuous operation under the following conditions unless otherwise indicated.
a. Ambient Temperature Limits: -5ºC through 40ºC.
b. Altitude not exceeding 6,600 feet.

B. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:

1. Notify Engineer, Construction Manager, Owner no fewer than 14 days in advance of proposed interruption of electric service.
2. Do not proceed with interruption of electric service without Engineer's, Construction Manager's, Owner's written permission.

1.10 COORDINATION:

A. Coordinate the layout and installation of panelboards and components with other types of equipment including raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.11 WARRANTY:

A. All equipment furnished under this Section shall be warranted by the Contractor and the equipment manufacturer(s) for a minimum period of one year after substantial completion.

B. Warranty shall include all parts, labor, and expenses to perform necessary work.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Subject to compliance with requirements, provide panelboard and mini-power center products of one of the following (for each type and rating of panelboard and enclosure):
1. ABB.
2. Eaton.
3. Siemens.
4. Square D, Schneider Electric.

2.02 GENERAL REQUIREMENTS FOR PANELBOARDS:

A. Except as otherwise indicated, provide panelboards, enclosures, and ancillary components of types, size, and ratings indicated, which comply with manufacturer's standard materials and with the design and construction in accordance with published product information.

B. Where types, sizes, or ratings are not indicated, comply with NEC, UL, and established industry standards for those applications indicated.

C. Equip with proper number of panelboard switching and protective devices as required for complete installation.

D. Provide ground fault circuit interrupter type circuit breakers where indicated.

E. Enclosures: Flush- and surface-mounted cabinets as indicated.
1. Provide enclosures fabricated by same manufacturer as panelboards which mate and match properly with panelboards.
2. Rated for environmental conditions at installed location. Provide NEMA type as described below and as defined by NEMA 250, unless indicated or specified otherwise.
   a. Indoor Dry and Clean Locations: NEMA Type 1 Type 12.
   b. Outdoor Locations: NEMA, Type 4X stainless steel.
   c. Wash-Down Areas: NEMA, Type 4X, stainless steel.
   d. Other Wet or Damp Indoor Locations: NEMA, Type 4X stainless steel.
3. Materials: Galvanized sheet steel cabinet type enclosures, in sizes required. Provide code gage (minimum 16-gage) thickness steel.

4. Must be UL 50 listed.
5. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover. Front doors shall have flush locks with three keys per panelboard, all panelboard enclosures keyed alike.
6. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor.
7. Gutter Extension and Barrier: Same gage and finish as panelboard enclosure; integral with enclosure body. Arrange to isolate individual panel sections. Provide multiple knockouts and wiring gutters. Provide hinged doors over vertical wiring gutter.
8. Finishes:
   a. Color: Baked gray enamel finish over a rust inhibitor coating.
   b. Panels and Trim: Galvanized steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
   c. Back Boxes: Galvanized steel. Stainless Steel for NEMA 4X panelboards.
9. Directory Card: Inside panelboard door, equip with interior circuit directory frame and removable card with clear plastic covering.

F. Phase, Neutral, and Ground Buses:
1. Bus shall be braced to withstand available short-circuit currents as indicated.
2. Provide suitable lugs on neutral bus for incoming and outgoing feeders requiring neutral connections.
3. Equipment Ground Bus: Bare, uninsulated, adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
4. Isolated Ground Bus: Adequate for branch-circuit isolated ground conductors; insulated from box. Provide as indicated.
5. Material: Tin-plated, Hard-drawn copper, 98% conductivity.

G. Conductor Connectors: Suitable for use with conductor material and sizes indicated and specified.
1. Material: Tin-plated Hard-drawn copper, 98% conductivity.
2. Main and Neutral Lugs: Mechanical type.
3. Ground Lugs and Bus-Configured Terminators.
4. Feed-Through Lugs: As indicated, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
5. Gutter-Tap Lugs: As indicated, suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
6. All lugs shall be mechanical type.
7. Provide terminals UL rated for 75ºC (minimum) conductors.

H. Service Equipment Label: NRTL labeled for use as service equipment for panelboards with one or more main service disconnecting and overcurrent protective devices.

I. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.

J. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals as indicated.

K. Surge Protection Devices: Provide an integral surge protection device for each panelboard as specified. Refer to Section 26 43 13 – Surge Protection Devices for device requirements.

L. Provide panelboard nameplate as indicated.

2.03 SERVICE ENTRANCE AND POWER DISTRIBUTION PANELBOARDS:

A. Panelboards: NEMA PB 1, dead front, safety type, power and feeder distribution type, 480Y/277V and 208Y/120V, 3 phase, 4 wire, 60 hertz, with full-sized neutral bus as indicated.
B. Panelboard switching and protective devices in quantities, ratings, types, and with arrangements shown.
C. Anti-turn, solderless, pressure-type main lug connectors approved for use with copper conductors.
D. Provide panelboards with UL markings which indicate "suitable for use as service entrance equipment". Shall meet UL 869A.
E. Incoming Mains Location: Top or bottom as indicated.
F. Mains: Circuit breaker or lugs only as indicated.
G. Branch Overcurrent Protective Devices:
    1. Bolt-on, molded-case circuit breakers.
    2. Molded-case circuit breakers shall have toggle handles that indicate when tripped.
    3. Where multiple pole breakers are indicated, provide with common trip so overload on one pole will trip all poles simultaneously.
    4. Circuit breakers shall be replaceable without disturbing adjacent units.
H. Provide an integral surge protection device to protect the panelboard as specified this Section. Refer to Section 26 43 13 – Surge Protection Devices for device requirements.
I. Doors: Secured with vault-type latch with tumbler lock; keyed alike.
    1. For doors more than 36 inches high, provide two latches, keyed alike.

2.04 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS:

A. Panelboards: NEMA PB 1, dead front, safety type, 480Y/277V and 208Y/120V (voltage rating as required), 3 phase, 4 wire, , 60 hertz with full-sized neutral bus.
B. Lighting and appliance branch-circuit type as indicated with switching and protective devices in quantities, ratings, types, and arrangements shown.
C. Incoming Mains Location: Top or bottom as required.
D. Mains: Circuit breaker or lugs only as indicated.
E. Branch Overcurrent Protective Devices:
    1. Bolt-on, molded-case circuit breakers.
    2. Molded-case circuit breakers shall have toggle handles that indicate when tripped.
    3. Where multiple pole breakers are indicated, provide with common trip so overload on one pole will trip all poles simultaneously.
    4. Circuit breakers shall be replaceable without disturbing adjacent units.
F. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.
G. Provide an integral surge protection device to protect the panelboard as specified this Section. Refer to Section 26 43 13 – Surge Protection Devices for device requirements.

2.05 PANELBOARD INTEGRAL SURGE PROTECTION DEVICE:

A. Provide surge protection device (SPD) designed for installation within the panelboard. The SPD shall connect directly to the bus bar and have an integral disconnect. SPD shall be approved by panelboard manufacturer for installation within the panelboard. Indicating lights shall be mounted in the face of the panelboard. The unit shall provide the following modes of protection: line-to-line (L-L), line-to-ground (L-G), line-to-neutral (L-N), and neutral to ground (N-G).
B. Refer to Section 26 43 13 – Surge Protection Devices for SPD requirements.
C. Accessories:
    1. Green LED status indicator per phase.

2. Red LED service indicator.
3. Test function for LEDs and audible alarm.
4. Internal audible alarm with mute switch.
5. Surge event counter.

2.06 VOLTAGE INDICATING DEVICE VOLTAGE TEST PORTALS

A. Provide combination LED voltage indicating device and absence of voltage test portal for volt meter probes at each switchboard section, MCC section and panelboard section. Manufacturer shall be Grace Technologies PESD Combination Unit or engineer approved equal. Devices shall be factor installed into switchboard, MCC and panelboard sections.

2.07 MINI-POWER CENTERS:

A. General: Provide a combination transformer and panelboard as specified and indicated.
   1. Transformer: The transformer shall be totally enclosed, non-ventilated, NEMA 3R, dry-type, general purpose, 480V single-phase primary, 240/120V single-phase secondary, 60-Hz, 2-5% full capacity primary taps above and below normal, copper primary and secondary windings, maximum temperature rise of 115ºC at rated kVA, sound level rating shall not exceed NEMA ST 20 standards. Provide kVA rating as indicated. Comply with DOE energy efficiency standards as defined by 10 CFR Part 431.196 - Energy Conservation Standards for all transformers 15 kVA and larger.

B. Panelboards: NEMA PB 1, dead front, safety type with full-sized neutral bus, with switching and protective devices in quantities, ratings, types, and arrangements shown.

C. Incoming Mains Location: Bottom as required.

D. Mains: Circuit breaker as indicated.

E. Branch Overcurrent Protective Devices:
   1. Bolt-on, molded-case circuit breakers with minimum interrupting rating of 10,000 amperes at 240Vac.
   2. Molded-case circuit breakers shall have toggle handles that indicate when tripped.
   3. Where multiple pole breakers are indicated, provide with common trip so overload on one pole will trip all poles simultaneously.
   4. Circuit breakers shall be replaceable without disturbing adjacent units.

F. Conductor Connectors: Mechanical type for main, neutral, and ground lugs and buses.

G. Additional Requirements:
   1. The complete mini-power center shall be UL listed, rated for a minimum of 14,000 AIC rms, symmetrical at 480Vac, complete with lifting eyes and mounting brackets.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.

B. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.

C. Verify Site conditions are suitable for installation of equipment.

D. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the work.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION OF PANELBOARDS:

A. Install panelboards, mini-power centers, and enclosures as indicated, providing NEC required working space, in accordance with manufacturer's written instructions, applicable requirements of NEC and in compliance with recognized industry practices to ensure that products fulfill requirements. Provide seismic support and bracing that shall resist the forces of a Seismic Zone B event without damage.

B. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torqueing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL 486A.

C. Fasten enclosures firmly to walls and structural surfaces, ensuring that they are permanently and mechanically anchored.

D. Provide properly wired electrical connections for panelboards within enclosures.

E. Install numbers on all circuit breakers and type the panelboard's circuit directory card upon completion of installation work. Clearly identify the load on each circuit and the circuit number according to the Contract Drawings.

F. Provide filler plates in all unused spaces.

G. Provision for future circuits at all flush mounted panelboards (unless indicated otherwise): Extend four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Extend four 1-inch conduits into raised floor space or below floor slab (not required for slabs on grade or basement floor slabs).

3.03 GROUNDING:

A. Provide equipment grounding connections for panelboard enclosures as indicated and as required by NEC. Tighten connections to comply with tightening torques specified in UL 486A to assure permanent and effective grounds. Provide grounding as specified in Section 26 05 26 – Grounding and Bonding for Electrical Systems.

3.04 IDENTIFICATION:

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with Section 26 05 53 – Identification for Electrical Systems.

B. Create a directory to indicate installed circuit loads after balancing panelboard loads; incorporate equipment served and room designations as indicated on the Drawings. Use a computer or typewriter to create directory; handwritten directories are not acceptable. Panelboard directory shall be subject to approval by the Engineer.

C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 26 05 53 – Identification for Electrical Systems.

D. Device Nameplates: Label each branch circuit device in power distribution panelboards with a nameplate complying with requirements for identification specified Section 26 05 53 – Identification for Electrical Systems.

3.05 FIELD QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections as specified and as recommended by the equipment manufacturer.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Acceptance Testing Preparation:
   1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.

E. Tests and Inspections:
   1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
   2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   3. Prior to energization of electrical circuitry, check all accessible connections to manufacturer's tightening torque specifications.
   4. Prior to energization, check panelboard circuits for short circuits, electrical continuity of circuits, enclosure grounding and neutral grounding at service entrance and at incoming derived source transformer.
   5. Prior to energization of panelboards, check with insulation resistance tester the phase-to-phase and phase-to-ground insulation resistance levels of each phase bus to ensure requirements are fulfilled. Record and submit test results.
   6. Panelboards will be considered defective if they do not pass tests and inspections.
   7. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.06 FINISHES:

A. Equipment coatings shall be free from scratches, rust, or other defects.
B. All damaged or defective coatings shall be repaired prior to final acceptance.
C. Field Painting:
   1. Touch Up:
      a. Contractor shall prepare surfaces and touch up manufacturer applied coatings as required for any damage during shipment and installation.
      b. Field painting shall be performed based on manufacturer’s recommended procedures.
      c. Panelboard manufacturer shall furnish Contractor with an adequate quantity of touch-up paint to match the factory applied finish.

3.07 ADJUSTING AND CLEANING:

A. Adjust moving parts and operable components to ensure normal function as recommended by manufacturer.
B. Upon completion of installation, clean interior and exterior of panelboards. Remove paint splatters, spots, dirt and debris.
C. Touch-up scratched or marred surfaces to match original finishes.
D. Adjust transformer taps of mini-power centers as required.

3.08 PROTECTION:

A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions.

3.09 DEMONSTRATION:

A. Subsequent to final wire and cable hook-ups, energize panelboards and demonstrate functioning in accordance with requirements. Where necessary, correct malfunctioning units, and then retest to demonstrate compliance.

END OF SECTION 26 24 16

SECTION 26 24 19 – MOTOR CONTROL CENTERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes the following:
   1. Motor control center and all necessary parts for complete assembly.
   2. Network components mounted within the motor control center.
   3. Coordination of motor horsepower and starter size, including overload protection, as required by the final designed horsepower submitted.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 73 – Power System Studies.
B. Section 26 43 13 – Surge Protection Devices.
C. Section 40 66 00 – Process Control Networks.
D. Section 40 61 96 – Process Control Software Programming and Reports.

1.04 REFERENCE STANDARDS:

A. American National Standards Institute/National Electrical Manufacturers Association (ANSI/NEMA):
   1. ANSI/NEMA C37.50 – Low Voltage AC Power Circuit Breakers Used in Enclosures - Test Procedures.
   2. ANSI/NEMA C37.51 – Metal-Enclosed Low Voltage AC Power Circuit Breaker Switchgear Assemblies - Conformance Test Procedures.

B. American Society for Testing and Materials (ASTM):
   1. ASTM A123 – Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   2. ASTM A153 – Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
   3. ASTM B5 – High Conductivity Tough Pitch Copper Refinery Shapes.
   4. ASTM B187 – Copper Bus Bar, Rod and Shapes and General Purpose Rod, Bar and Shapes.
   5. ASTM B188 – Seamless Copper Bus Pipe and Tube.
   6. ASTM B211 – Aluminum and Aluminum-Alloy Rolled or Cold Finished Bar, Rod and Wire.
   7. ASTM B236 – Aluminum Bars for Electrical Purposes (Bus Bars).
   8. ASTM B317 – Aluminum-Alloy Extruded Bar, Rod, Pipe, Structural Profiles, and Profiles for Electrical Purposes (Bus Conductor).

C. Institute of Electrical and Electronic Engineers (IEEE):
   1. IEEE C37.13 – Low-Voltage AC Power Circuit-Breakers Used in Enclosures.
   2. IEEE C37.16 – Preferred Ratings, Related Requirements, and Application Recommendations for Low-Voltage AC (635 V and below) and DC (3200 V and below) Power Circuit Breakers.
   3. IEEE C37.20 – Metal-Enclosed Low-Voltage (1000 Vac and below, 3200 Vdc and below) Power Circuit Breaker Switchgear.
   4. IEEE C57.13 – Standard Requirements for Instrument Transformers.

D. National Electrical Manufacturers Association (NEMA):
   1. NEMA ICS Complete Set – Industrial Controls and Systems.
   2. NEMA PB 1 – Panelboards.

3. NEMA PB 2 – Deadfront Distribution Switchboards.
4. NEMA ST 20 – Dry-Type Transformers for General Application.

E. National Fire Protection Association (NFPA):
1. NFPA 70 - National Electrical Code (NEC): Comply with requirements of NEC as applicable to motor control center equipment and components.

F. Underwriters' Laboratories, Inc. (UL):
1. UL 50 – Enclosures for Electrical Equipment, Non-Environmental Considerations.
2. UL 489 – Molded Case Circuit Breakers, Molded-Case Switches and Circuit Breaker Enclosures.
3. UL 508 – Industrial Control Equipment.
4. UL 845 – Motor Control Centers.
5. UL 857 – Busways.
6. UL 1449 – Surge Protective Devices.

1.05 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

B. Submittals shall be custom prepared by the MCC manufacturer for this specific application.

C. Product Data: Submit for each type of product specified and included, with the following as minimum:
1. Data sheets for all components furnished as part of the system package.

D. Shop Drawings: Provide the following as minimum.
1. Fabrication and erection drawings.
2. Equipment dimensions, including stub-up locations, shipping splits and shipping weights.
3. Equipment ratings.
4. General outline drawing.
5. Detailed equipment installation drawings.
6. Schematic diagrams.
7. Bill of materials.
8. Nameplate schedule.
9. Surge Protective Device data and testing laboratory reports.
10. Sizing calculations for active harmonic filters.
11. Complete loading diagrams covering static and dynamic loadings for all conditions of operation and structural steel details.
12. Complete unit and internal wiring diagrams.
13. External connection diagrams.
14. Instrument transformer performance curves and data.
15. Time-current characteristic curves for overcurrent protective devices.
16. Configuration sheet for each intelligent overload relay that indicates all available settings for the relay along with recommended settings for each parameter. Any settings which require field adjustment or Engineer input shall be clearly indicated.
17. Complete list of available parameters from intelligent components including overload relays, variable frequency drives, and power meters. List shall include I/O addresses.

E. Seismic Qualification Certificates: Submit certification that switchboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls for Electrical Systems. Include the following:
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assemble components or on calculation.

2. Dimensioned Outline Drawing of Equipment Unit: Identify center of gravity and locate describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

F. Special Procedure Submittals:
1. Start-up and commissioning instructions.
2. Syllabus for Owner training.

G. Test and Evaluation Reports:
1. Factory acceptance test reports.
2. Commissioning test reports.

H. Closeout Submittals: Final documentation shall include the following as minimum:
1. Operation and Maintenance Manuals including the following:
a. Operation and maintenance manuals for all components furnished.
b. Certified "As-Built" drawings of all equipment with information listed above.
c. Copies of all approved Product Data.
d. Copies of all approved Test Reports.
e. Spare parts and supply list with supplier names and part numbers.
f. Warranty Information.
g. Manufacturer's service and repair support during and after warranty including contact information.
h. Configuration sheet for each intelligent overload relay indicating as installed settings for each relay.
i. Training Materials. Includes final edited training videos.

I. Maintenance Material Submittals:
1. Spare Parts:
a. Three spare LED indicating lamps for each type and color used.
b. Three spare indicating light assemblies.
c. Ten spare power and control fuses of each voltage and current rating used.
d. One 12oz aerosol cans of manufacturer's touch-up paint for each color used. Color shall match the original factory applied color.
e. One spare intelligent overload relay (NEMA Size 1).
f. One spare Ethernet network switch.
g. One spare 24Vdc power supply.
h. All parts supplied with the equipment shall be properly labeled for ease of identification and to permit the shortest possible time to repair.
2. Software:
a. Soft copy of computer software for programming solid-state overload relays and controllers supplied as part of the MCC equipment package.
b. Organize and submit software on a USB flash drive or DVD-ROM(s).

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use for at least one year prior to Bid opening.

B. Factory Tests:
1. The manufacturer shall conduct tests according to industry standard requirements.
2. Perform factory tests on all system components and subassemblies to assure that all devices and systems are in proper working order before delivery to jobsite.
3. Test all power, control and communication systems for proper operation.

4. Simulate actual system operation.
5. System Level Tests:
    a. The system shall be given preliminary checks including verification of electrical connections including ground connections, power and control wiring shall be resistance checked point-to-point.
    b. Firmware of electronic components shall be checked for correct revision level.
    c. The equipment shall be fully checked against the approved drawings for compliance and correct physical dimensions.
6. Submit test reports as specified in Division 01.

C. Equipment shall be manufactured, assembled, tested and provided with appropriate UL labels.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. The MCC shall be delivered to the site pre-assembled and wired with all specified interconnecting wiring and cable. Cabling for connection across shipping splits shall be neatly coiled and identified. Exposed sections of equipment shall be fully protected from damage during shipment. All necessary hardware for reconnecting shipping splits shall be provided.
    1. The MCC manufacturer shall be responsible for all system interconnections across shipping splits at the project site.

B. Complete instructions for handling and storage shall be provided by the manufacturer prior to delivery of the equipment. All equipment shall have adequate provisions for handling by overhead crane or fork lift truck.

C. MCCs shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants. Store at secured and insured warehouse location.

1.08 COORDINATION:

A. Coordinate the size and location of concrete equipment pads. Cast anchor bolt inserts into the equipment pad as required. Concrete, reinforcement, and formwork are specified in Division 03.

1.09 PROJECT SITE CONDITIONS:

A. Do not store or install the MCC equipment specified herein until designated installation spaces are suitable for intended service.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing the MCC and shall be maintained for the remainder of the construction period.

1.10 WARRANTY:

A. All equipment furnished under this section shall be warranted by the Contractor and the equipment manufacturer(s) for a minimum period of 5 years after completion of startup and as defined in Division 01.

B. Warranty shall include all parts, labor, and expenses to perform necessary work.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. ABB, Inc.
B. Eaton.
C. Schneider Electric.

D. Siemens.

2.02 MOTOR CONTROL CENTER ASSEMBLY:

A. Conform to ANSI/IEEE C37.20 and applicable ASTM, IEEE, NEMA and UL standards specified in PART 1, REFERENCES.
B. Rated 480Y/277-volt, 3-phase, 4-wire and 60 Hz.
C. The motor control center assembly including bus bracing and overcurrent devices shall have a minimum symmetrical interrupting rating as required.
D. Main horizontal bus of tin-plated copper with minimum rating as indicated continuous.
E. Vertical bus shall be tin-plated copper and shall be rated a minimum of 300 Amps.
F. Provisions shall be provided for splicing additional sections to either end of the motor control center.
G. Neutral bus continuous ampere rating 100% of main bus capacity.
H. Provide bonding jumper between the neutral and ground buses when indicated.
I. All copper bus bars shall be composed of 98% IACS copper with a current density of 1000-A per square inch and be plated as specified.
J. The dimensions (width, length and height) of the motor control center shall not be larger than the floor space allocated for the motor control center as indicated on the drawings.

2.03 ENCLOSURE:

A. Assemblies of vertical metal-enclosed sections, each nominally 20 inches wide, 20 inches deep, and 90 inches high, joined together to form totally enclosed freestanding units, designed to permit easy addition and removal of sections in the field.
B. NEMA Class I, Type B wiring construction, including intelligent MCC Ethernet.
C. NEMA Type 1, enclosure construction.
D. Ground bus provided for full length of the motor control center with lug for grounding the unit, located toward the bottom front of the MCC.
E. Section Arrangement:
    1. Minimum individual motor starter height: 12 inches.
    2. Minimum individual feeder device height: 6 inches.
    3. Front-mounted or arranged for back-to-back mounting as indicated.
    4. Arrange units to obtain best fill of each vertical section for minimum overall length, including spare spaces.
    5. Mount larger starters and transformers at bottom of each section.
    6. Locate metering components and other operator interface devices at a convenient operating height.
F. Construction:
    1. Horizontal wiring tray at top and bottom of unit.
    2. Vertical wireway with hinged door. Wireway shall have provisions for cable supports.
    3. Complete accessibility from front to all buses, starters, control devices, and all other components for wiring and maintenance.
    4. Front-mounted starter units, circuit breaker units, and other equipment in separate compartments isolated by steel barriers.
    5. Guide rails, separator bars, cover plates, and other provisions necessary for installation of a future starter unit in all future spaces and blank spaces remaining in the units after all required components are installed.
    6. Permanent base channel sills having closure strip at each end of units.
    7. Each unit compartment shall be provided with an individual hinged front door.

8. An operating mechanism shall be mounted on the primary disconnect of each starter unit. It shall be mechanically interlocked with the unit door to prevent access, unless the disconnect is in the OFF position. A mechanical means shall be provided to bypass this interlock. Padlocking capability shall be provided to positively lock the disconnect in the OFF position.

G. Finish:
1. Paint system with manufacturer's standard coating system suitable for intended service.
2. Exterior paint color shall be light gray.
3. Interior surfaces shall be painted white.

H. Nameplates:
1. Wording and equipment tags as indicated.
2. Engraved phenolic nameplates for each starter unit, fused disconnect unit, circuit breaker unit, and other equipment items that are unit mounted.
3. Engraved phenolic "master" nameplate for each motor control center.

2.04 INTELLIGENT SYSTEMS:

A. General:
1. Each motor control center shall be provided with a factory installed Ethernet network that utilizes Ethernet/IP communication protocol.
2. Ethernet/IP shall be the native communication language of the device and the use of protocol converter modules to allow devices to communicate on the specified network is not allowed.

B. Control Power:
1. Each combination motor starter, variable frequency drive, reduced voltage solid-state starter and contactor shall be provided with a unit mounted control power transformer to power control relays, indicating lights, motor space heaters, cooling fans and other equipment as indicated and specified.
2. Each MCC shall be provided with a redundant, 24Vdc power system to power network equipment, VFD communication and control boards, and intelligent overloads.
   a. A minimum of two full capacity 120Vac to 24Vdc power supplies shall be provided for each MCC. Each power supply shall be provided with a dedicated input circuit breaker and shall each be powered from a separately derived 120Vac source outside of the motor control center. Field terminal blocks shall be provided for this external power source.
   b. Each power supply shall be sized to accommodate all connected components plus a minimum of 20% spare capacity.
   c. A failure contact shall be provided from each power supply. Contact shall be rated a minimum of 3 Amps at 120Vac. Provide interposing relay if required. Contacts shall be factory wired to field terminal blocks.

C. Communication Network:
1. The motor control center shall have Category 5e Ethernet cabling installed from each intelligent unit back to the associated unit mounted Ethernet switch as indicated.
2. Refer to Section 40 66 00 – Network and Communication Equipment for Ethernet switch requirements. Provide a minimum of 20% spare ports for each motor control center.
3. For redundancy purposes the number of components connected to a single Ethernet switch shall be limited. A minimum of two network switches per MCC shall be provided. Switch connections shall be distributed to maximize the redundancy of the connected loads in the event of a single switch failure.

4. Ethernet cabling shall be routed through the MCC line-up, behind barriers that isolate the cabling from the unit space and wireways to prevent damage during installation.
5. Spare cables shall be routed to sections containing spare space. A minimum of one cable per 12-inches of spare space shall be provided.
6. The addition or removal of a unit from the network shall not interrupt the operation of other units within the system.
7. The manufacturer shall factory program the IP address, Subnet, and Default Gateway for all intelligent components. Coordinate with the Systems Integrator for IP Address assignments.

2.05 INCOMING LINE SECTION:

A. Incoming Power Feeder:
1. Necessary lugs, clamps, supports, space and all items to terminate cables and busway as required.
2. Main lug only or main circuit breaker as indicated.

2.06 MAIN CIRCUIT DEVICES:

A. Molded Case Circuit Breakers:
1. Provide for circuit breakers rated less than 225 Amps.
2. Molded-case, manually-operated, 3 pole.
3. Trip-free from handle.
4. Inverse time thermal element overload protection.
5. Instantaneous magnetic short-circuit protection on all poles.
6. External handle which clearly indicates when breaker is "ON," "OFF," or "TRIPPED," and lockable in the "OFF" position.

B. Molded-Case Circuit Breakers With Solid State Trip Unit:
1. Provide for circuit breakers rated 225 Amps and above.
2. Molded-case, manually-operated, 3 pole circuit breaker with solid state trip unit.
3. Trip-free from handle.
4. Solid state trip unit shall have the following features:
   a. Adjustable long time pickup.
   b. Adjustable long time delay.
   c. Adjustable short time pickup.
   d. Adjustable short time delay.
   e. Adjustable instantaneous time pickup.
   f. Adjustable instantaneous time delay.
   g. Adjustable ground fault time pickup.
   h. Adjustable ground fault time delay.
   i. I^2t settings for instantaneous and ground fault.
5. External handle which clearly indicates when breaker is "ON," "OFF," or "TRIPPED," and lockable in the "OFF" position.
6. Accessories:
   a. Auxiliary contacts as indicated.
   b. Shunt trip.

2.07 FEEDER DEVICES:

A. Provide Molded Case Circuit Breakers rated less than 200A:
1. Molded-case, manually-operated, 3 pole.
2. Trip-free from handle.

3. Inverse time thermal element overload protection.
4. Instantaneous magnetic short-circuit protection on all poles.
5. External handle which clearly indicates when breaker is "ON," "OFF," or "TRIPPED," and lockable in the "OFF" position.

B. Provide Molded-Case Circuit Breakers With Solid State Trip Unit rated 200A or greater:
1. Molded-case, manually-operated, 3 pole circuit breaker with solid state trip unit.
2. Trip-free from handle.
3. Solid state trip unit shall have the following features:
   a. Adjustable long time pickup.
   b. Adjustable long time delay.
   c. Adjustable short time pickup.
   d. Adjustable short time delay.
   e. Adjustable instantaneous time pickup.
   f. Adjustable instantaneous time delay.
   g. Adjustable ground fault time pickup.
   h. Adjustable ground fault time delay.
   i. I^2t settings for instantaneous and ground fault.
4. External handle which clearly indicates when breaker is "ON," "OFF," or "TRIPPED," and lockable in the "OFF" position.
5. Accessories:
   a. Auxiliary contacts as indicated.
   b. Shunt trip.

2.08 COMBINATION STARTERS:

A. General:
1. Factory-mounted interchangeable-type 12 inches or larger vertical modular units, with hinged doors.
2. Each combination starter shall be provided with a motor circuit protector (MCP) type disconnect.
   a. Shall be provided with an external handle that clearly indicates when the MCP is "ON," "OFF," or "TRIPPED" and be lockable in the "OFF" position.
   b. Molded-case, manually-operated, 3-pole.
   c. Adjustable, instantaneous-trip, magnetic-only-type circuit breaker.
   d. Coordinated unit rating for circuit protector and starter.
3. Suitable sized, fused, individual control transformers for supplying 120Vac control power to each motor starter coil, and its associated equipment as indicated.
4. Starters and starter spare spaces as indicated.
5. Each starter sized according to horsepower rating of motor furnished. One-line diagrams show approximate motor horsepower ratings and sizes of spare starters and spare starter spaces.
6. Auxiliary contacts as required by Contract Drawings.
7. Spare auxiliary contacts: One normally open and one normally closed, unless indicated otherwise.
8. Momentary or maintained start-stop push buttons, selector switches, control switches, time delay relays, and indicating lights for motor starters as indicated.

B. Full-Voltage Starters:
1. Provide full voltage NEMA type non-reversing starters.
2. Minimum starter size NEMA Size 1.
3. Provide voltage snubbers in parallel with contactor coil.

4. Provide with solid-state, self-powered overload relay sized for and adjustable to full load current of the motor being protected. Overload relay shall be manually reset and provide phase loss protection. Overload trip class shall be selectable between 5, 10, 20 and 30.
5. External manual reset of overload relay from outside of the unit enclosure.

C. Solid-State Reduced-Voltage Starter:
1. Provide solid-state reduced voltage starters with shorting contactors as indicated.
2. Microprocessor based solid-state controller.
3. Provide a smooth, stepless acceleration of a three phase induction motor.
4. Be capable of linear voltage ramp or current limit starting.
5. Have current limit capability adjustable between 150% and 450% of motor full load current.
6. Have an adjustable ramp time between 0.5 and 60 seconds.
7. Provide a soft stop capability to decelerate a motor over an adjustable time between 0 and 60 seconds.
8. Shall be rated for a minimum of four starts per hour at 450% current limit and a 30 second ramp time.
9. Power section shall consist of six Silicon Controlled Rectifiers (SCRs).
10. SCR's shall have a minimum repetitive peak inverse voltage rating of 1400 volts at 480 volts.
11. Have solid-state overload protection with an external manual reset and selectable overload trip class between 5, 10, 20 and 30.
12. Have phase loss detection which shall inhibit starting or shutdown the controller if a loss of any of the phases is detected.
13. Have shorted SCR detection which shall inhibit starting or shutdown the controller if one or more shorted SCRs are detected.
14. The following diagnostics shall be provided on the front of the controller:
    a. Control Power Available.
    b. Controller On.
    c. Overload Trip.
    d. Phase Loss.
    e. Shorted SCR.
15. Controller shall be convection cooled or fan cooled as required.
16. Have an ambient operating air temperature range of -20°C to +50°C without derating.
17. Shall be capable of operating in relative humidity of 5-95%, noncondensing.

D. Solid-State Intelligent Overload Relays:
1. Provide intelligent overload relays as indicated.
2. Provide with Ethernet/IP Ethernet communication capability.
3. Shall be provided with integral web page that allows for viewing and setting parameters utilizing standard web browser software.
4. Fully programmable electronic overload relays. Overloads shall provide a 4.5:1 adjustment range matched to NEMA contactor sizes 00-6. Overload relays shall monitor all 3 phases for current.
5. Parameter setting of the overload via network communications shall be supported.
6. Automatic, network, electronic and manual reset functions shall be supported.
7. As a minimum, the following protective functions shall be provided based on user configurable parameters:
    a. Thermal Overload.
    b. Current Phase Imbalance.
    c. Current Phase Loss.

d. Undercurrent.
e. Overcurrent.
f. Ground Fault.
g. Automatic Restart.

8. As a minimum, the overload shall provide the following user configurable parameters:
   a. Selectable Trip Class between 5, 10, 15, 20 and 30.
   b. Overload Restart Delay.
   c. Trip Delays for protective functions.
9. As a minimum, the overload shall provide the following diagnostic and operational information:
   a. Error and Trip Indicators.
   b. Ground Fault, L1, L2, L3 and 3 Phase Average Currents.
   c. Current Unbalance.
   d. Thermal Capacity Remaining.
   e. Fault History (Last 5 faults).
   f. Product Identifier.
   g. Run time accumulator.
10. Shall provide the following programmable I/O:
    a. Four (4) discrete inputs.
       (1) When more than Four (4) discrete inputs are indicated provide an expansion module to accommodate the additional I/O.
    b. Two (2) relay outputs.
11. Powered from 24Vdc.

2.09 ACTIVE HARMONIC FILTERS:

A. General Requirements:
1. Active harmonic filters shall be provided where required to meet 5% total demand distortion-current and 5% total harmonic voltage distortion and provide power factor correction to 0.95 lagging at the input lugs or circuit breaker for each MCC provided.
2. Units shall be selected and sized by the MCC manufacturer for all of the nonlinear loads connected to the MCC. Multiple units shall be provided if required. Units shall be sized to provide correction when only one of the nonlinear loads is operating or when all of the nonlinear loads are operating.
3. Shall provide harmonic cancellation to the 50th harmonic.
4. Maximum response time to step changes shall be 8 milliseconds.
5. Capable of paralleling up to 10 units.
6. All setup and programming of the filter shall be performed at the factory and tested at the factory.
7. CT and PT required for proper operation of the unit shall be provided and installed at the factory.

B. Over Current Protection:
1. Shall be provided with an input circuit breaker.
2. Provided with an external handle that clearly indicates when the circuit breaker is “ON”, “OFF”, or “TRIPPED” and be lockable in the “OFF” position.
3. Molded-case, manually-operated, 3-pole.
4. Provide instantaneous and thermal magnetic short circuit protection.

C. Physical Requirements:
1. Shall be capable of continuous operation in an average ambient temperature between 0°C and 40°C at an elevation up to 3300 feet (1000 meters) above MSL without derating.

Shall also be simultaneously suitable for continuous operation in a maximum humidity between 0 and 95% noncondensing.

2. Shall be air-cooled.

D. Keypad and Display:

1. A door mounted keypad with integral digital LCD display shall be furnished, capable of controlling the filter and setting parameters. The display shall present all diagnostic message and parameter values in standard engineering units when accessed, without the use of codes. The keypad shall allow the operator to enter exact numerical settings in standard engineering units. A plain English user menu (rather than codes) shall be provided in software as a guide to parameter setting.
2. As a minimum, the following parameters shall be available for display:
   a. AC line voltage.
   b. DC bus voltage.
   c. Load power factor.
   d. Unit output power factor.
   e. Load harmonic current.
   f. Load reactive current.
   g. Output harmonic current.
   h. Corrected load current.
   i. Unit status.
   j. Fault alarms.
3. Filter parameters shall be factory set in non-volatile memory and re-settable in the field through the keypad. Password security shall be available to protect parameters from unauthorized personnel.

E. Hard-Wired I/O:

1. Provide dry contact outputs rated a minimum of 2 Amps at 120 Vac to indicate the following:
   a. Filter operating.
   b. Common Fault alarm. If multiple units are provide in a single MCC line up fault contacts shall be wired in parallel to provide a single fault contact.

2.10 SURGE PROTECTIVE DEVICE (SPD):

A. Each MCC shall be provided with an integral Surge Protective Device (SPD). Refer to Section 26 43 13 – Surge Protection Devices.

2.11 PROTECTIVE RELAYS:

A. Motor Protection Relays:

1. Provide a microprocessor based motor protection relay for each pump motor as indicated on drawings.
2. The relays shall be front panel mounted and factory wired to field terminal blocks in the motor control center compartments.
3. The relay shall support the following ANSI protection functions:
   a. 37 - undercurrent/underpower.
   b. 38 - bearing temperature.
   c. 46 - current unbalance.
   d. 49 - stator temperature.
   e. 50/51 - instantaneous/overcurrent.
   f. 50G/51G - ground instantaneous/ground overcurrent.
   g. 66 - starts/hour and time between starts.

h. 86 - lockout.

4. The relay shall support the following field wiring:
   a. Three (3) 0 to 5 A phase current inputs.
   b. A minimum of 11 RTD inputs, field programmable, 100 ohm platinum.
   c. A minimum of four (4) discrete inputs, field programmable, optically isolated.
   d. A minimum of four (4) output relays, Form C, 120Vac minimum. One of the output relays shall be factory configured for trip function.
   e. Shall be powered from the motor control circuit.
   f. One (1) RS232 port and one (1) RS485 port for communication up to 19,200 bps.
   g. Tamper switch to prevent unauthorized tampering of setpoints.
5. Environmental rating: -40°C to +60°C.
6. Trip and alarm temperature range: 0 to 200°C.
7. The relay shall be capable of storing up to 250 sequential events records.
8. The relay shall be capable of retaining programmed setpoints and historical data in nonvolatile memory when the control power is removed.
9. The relay shall feature a minimum of fifteen (15) standard thermal overload curves which are user-selectable and a minimum of one (1) custom thermal overload curve which is user programmable. The thermal overload curves shall allow for the motors to operate continuously at 1.15 service factor without tripping on overload or overcurrent.
10. The relay shall be provided with a display and keypad. The display shall enable the users to view actual metered values, causes of alarms and trips and programming setpoints. The keypad shall enable the users to select the display of actual metered values, causes of alarms and trips, fault diagnosis and to program setpoints.
11. Provide LED indicators for displaying operating and trip statuses.
12. The relay shall be provided with a draw-out or fixed case. For a fixed case mounting, provide shorting terminal blocks for current transformer leads accessible from front of the compartments. The terminal blocks shall be General Electric PK-2 blocks or equal.
13. Provide setup and monitoring software with each relay. The software shall be Windows-based and shall be capable of creating, storing and downloading setpoint files to the relay. The software shall also be capable of viewing real-time values and retrieving, recording and trending of historical values.
14. Acceptable manufacturers: General Electric Company/Multilin, Basler Electric Company, Schneider Electric, Eaton or approved equal.

B. Current Transformers:
   1. Dry-type, torodial bushing or wound-type.
   2. Ratio as indicated or required by application.
   3. Accuracy conforming to ANSI/IEEE C57.13 Classification 2.5H or 2.5L for relaying and 0.3 for metering.
   4. Thermal and mechanical ratings corresponding to equipment with which applied.
   5. Secondary terminals connected to short-circuiting-type terminal blocks.

2.12 CONTACTORS:

A. Rated 600 volts.
B. 3 pole.
C. Coil designed to operate at 120Vac, 60 Hz.
D. Correct NEMA size with contacts rated for the specific load.

2.13 MISCELLANEOUS:

A. Push Buttons and Selector Switches:

1. Heavy duty, 30 mm units with contacts rated 10A continuous at 120Vac.
2. NEMA 4/12 rated.
3. Provide the number of contacts and contact development as required.
4. Start push buttons shall have green operators.
5. Stop push buttons shall have red operators.
6. Emergency Stop push buttons shall have red mushroom head operators.

B. Pilot Lights:
1. Heavy duty, 30 mm units.
2. NEMA 4/12 rated.
3. 120Vac cluster LED type.
4. Red lights shall indicate motor ON .
5. Green lights shall indicate motor OFF .
6. Amber lights shall indicate equipment failure.
7. White lights shall indicate power to MCC bucket ON.
8. Push-to-test type.

C. Control Relays:
1. Industrial type rated 600-volt, 60-Hz, with convertible contacts.
2. Minimum 10 Amp contact rating.
3. Coil voltage: 120-volt, 60-Hz.
4. Number of normally open and normally closed contacts as required.
5. Provide a minimum of two spare normally open and normally closed contacts.

D. Space Heaters:
1. Provide differential thermostat controlled space heaters in each section.
2. Space heaters shall be sized to prevent condensation within the enclosure.
3. Power space heaters from MCC.
4. Provide required control power transformer and overcurrent protection for space heaters.

E. Control Wiring:
1. Small wiring, necessary fuse blocks and terminal blocks within the motor control center shall be furnished as required.
2. Numbered terminal blocks shall be provided for field wiring and shall be suitable for copper cable rated for 75°C of the size as indicated on the drawings.
3. Terminal blocks shall be rated for 600 Vac.
4. Provide a minimum of 20% spare terminal blocks in each unit.
5. All internal control wire shall be type MTW, bundled and secured with nylon ties.
6. All current transformer secondary leads shall first be connected to conveniently accessible shorting terminal blocks before connecting to any other device.
7. Wire markers shall be installed at each end of all control wiring.

F. Control components mounted within the assembly, such as fuse blocks, relays, push buttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturer's wiring diagrams.

2.14 SOFTWARE:

A. When special software is required for interfacing or programming supplied equipment, provide one licensed copy of all required software to program, configure, control (for testing purposes) and monitor the intelligent overload relays, solid-state soft starters, variable frequency drives and power monitors. Software shall allow configuration files to be saved.

2.15 INFRARED (IR) WINDOWS

A. FLIR Infrared (IR) Windows: Provide two factory-installed infrared (IR) Flir or engineer approved equal windows per motor control center section. Factory locate IR windows for maximum viewing of bus, conductor, breaker, and other termination points.

2.16 VOLTAGE INDICATING DEVICES AND TEST PORTALS

A. Provide combination LED voltage indicating device and absence of voltage test portal for volt meter probes at each switchboard section, MCC section and panelboard section. Manufacturer shall be Grace Technologies PESD Combination Unit or engineer approved equal. Devices shall be factory installed into switchboard, MCC and panelboard sections.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment.
B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing MCCs and shall be maintained for the remainder of the construction period.

3.02 INSTALLATION:

A. Install shall conform to manufacturer's instructions.
B. Completely install as specified, indicated, or required for operation and continuous service at the locations indicated.
C. Provide all openings in floors, walls, roofs, and other structures necessary for complete equipment installation, unless such openings are specifically indicated as being provided by others. Include openings through floors for future cables to connect to spare breakers, starters, and the like and to spaces provided in equipment for future expansion.
D. Place Dow Corning 3-6548 Silicone RTV or General Electric RTF762 sealant in the following locations:
    1. All holes in concrete walls, floors and roof slabs after installation of conduit.
    2. All unused holes and sleeves as approved by Resident Project Representative.
E. For freestanding enclosures install a 4-inch high concrete equipment (housekeeping) pad 4-inches wider and 4-inches deeper than the MCC.
F. Level, shim, and anchor to floor or wall with bolts or concrete anchors, and grout all floor-mounted equipment.
G. Install all necessary wiring or interconnections as required.
H. Make all internal and external connections as indicated and as required by manufacturer's wiring diagrams.
I. Check all internal and external connections, especially current transformer secondary short circuiting jumpers, and tighten as required.
J. Place arc flash label on equipment.

3.03 FIELD QUALITY CONTROL:

A. Manufacturer’s Field Services:
    1. Manufacturer's field service shall be provided as specified in this Section and in Division 01.
    2. MCC manufacturer shall provide the field services of a factory technician for a minimum of 3 day(s) on 3 separate occasions to supervise/inspect installation, test and start-up all equipment provided. All travel and living expenses shall be included. All equipment

required for testing, start-up and performance verification shall be provided by the start-up technician.

3. Additional days and trips shall be provided as required to fully complete field testing, startup, and training as specified.
4. The MCC manufacturer shall provide a factory technician specializing in Ethernet/IP communication as part of the start-up field services. All equipment required for setup and configuration shall be provided by the technician. The technician shall be available to assist the Systems Integrator in setup and configuration of the plant control system network connections to the MCC and associated network connected devices.

B. Field Testing:
1. Perform “start-up” tests as recommended by manufacturer.
2. Prior to energization of circuitry, check all accessible connections to manufacturer's torque tightening specifications.
3. Prior to energization, check for electrical continuity of circuits and for short-circuits.
4. Prior to energization check with an insulation resistance tester: phase-to-phase and phase-to-ground insulation resistance levels to ensure requirements are fulfilled. Record and submit field test data.
5. Configure intelligent devices for proper communication on the Ethernet/IP network.
6. Configure intelligent device to maintain current state if network communication is lost unless specified or indicated otherwise. All devices shall be controllable locally at the motor starter or variable frequency drive if the communication system fails. Configure as required.
7. Set all parameters associated with intelligent overload devices for proper motor protection and system performance. Settings shall be recorded and included with final documentation as specified.
8. Test network communication to all network connected solid-state overload devices and verify the overload device is responding to commands and reporting statuses properly to the plant control system.

C. Additional Field Testing:
1. Provide additional field testing as required by motor control center manufacturer.

D. Submit field testing and commissioning reports as specified in Division 01.

3.04 FINISHES:

A. Equipment coatings shall be free from scratches, rust, or other defects.
B. All damaged or defective coatings shall be repaired prior to final acceptance.
C. Field Painting:
1. Touch Up:
a. Contractor shall prepare surfaces and touch up manufacturer applied coatings as required for any damage during shipment and installation.
b. Field painting shall be performed based on manufacturer’s recommended procedures.
c. MCC manufacturer shall furnish Contractor with an adequate quantity of touch-up paint to match the factory applied finish.

3.05 ADJUSTING AND CLEANING:

A. After field installation and final wiring terminations are completed the field connected power and control wiring and cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.

B. Prior to final acceptance the MCC interior and exterior shall be wiped clean and free from dust and debris.

3.06 TRAINING:

A. The MCC supplier shall provide a minimum of one days of training at the customer's facility for operations, maintenance and service personnel.
   1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
   2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, software mapping, programming, setup, configuration, control loop tuning, operational indicators, faults, diagnostic tools, troubleshooting, and preventive maintenance.
   3. Hands-on training shall be provided on equipment.
   4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.

B. Contractor shall record the training sessions and provide a final edited version to the Owner on a DVD-ROM and electronic video file format.

END OF SECTION 26 24 19

SECTION 26 27 26 –WIRING DEVICES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section covers wiring devices for lighting and utilization equipment including but not limited to the following:
   1. Receptacles.
   2. Switches.
   3. Wall Plates.
   4. Plugs.
   5. Switch Rated Plugs and Receptacles.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
B. Section 26 05 33 – Raceways, Boxes, Seals and Fittings for Electrical Systems.
C. Section 26 05 53 – Identification for Electrical Systems.
D. Section 26 50 00 – Lighting.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
B. National Electrical Manufacturers Association (NEMA):
   1. NEMA WD 1 – General Color Requirements for Wiring Devices.
   2. NEMA WD 6 – Wiring Devices - Dimensional Specifications.
   3. NEMA 410 – Performance Testing for Lighting Controls and Switching Devices with Electronic Drivers and Discharge Ballasts.
C. National Fire Protection Association (NFPA):
   1. NFPA 70 – National Electrical Code (NEC).
D. Underwriters Laboratories (UL):
   1. UL 20 – General-Use Snap Switches.
   2. UL 486A-486B – Wire Connectors.
   3. UL 498 – Attachment Plugs and Receptacles.
   4. UL 514D – Cover Plates for Flush-Mounted Wiring Devices.
   5. UL 943 – Ground-Fault Circuit-Interrupters.
   6. UL 1203 – Explosion-Proof and Dust-Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations.
   7. UL 1310 – Class 2 Power Units.
   8. UL 1472 – Solid State Dimming Controls.
   9. UL 1682 – UL Standard for Safety Plugs, Receptacles, and Cable Connectors of the Pin and Sleeve Type.
   10. UL 1686 – UL Standard for Safety Pin and Sleeve Configurations.
   11. UL 2682 – Switch Rated Plugs and Receptacles.

1.05 SUBMITTALS:

A. Refer to Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.
B. Product Data for each product specified.

1.06 QUALITY ASSURANCE:

A. Conform to the requirements of NFPA 70.
B. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this Section.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Wiring devices shall be packaged and shipped to the project site to avoid damage.
B. Store in a clean, dry space in original manufacturer's packing to avoid condensation, dust, and other environmental contaminants until ready for installation.

1.08 SEQUENCE AND SCHEDULING:

A. Schedule installation of wiring devices and associated wall plates after the surface upon which they are installed has received the final finish.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Appleton, Emerson Electric Co.
B. Cooper, Crouse-Hinds, Division of Eaton.
C. Hubbell, Inc.
D. Leviton Manufacturing Co., Inc.
E. Pass & Seymour, Legrand North America, Inc.
F. Russellstoll, Thomas & Betts.
G. Woodhead, Molex.
H. Source Limitation: Wiring device and associated wall plate shall be supplied from a single manufacturer for each type of device for consistency throughout project.

2.02 RECEPTACLES:

A. General:
   1. All receptacles shall be heavy-duty type and shall bear a UL 498 label and comply with NEMA WD 1 and WD 6 as applicable.
   2. Provide all necessary wiring and accessories as required for complete installation.
B. Flush-Mounted and Surface-Mounted Receptacles:
   1. Rated 20A at 125Vac.
   2. Duplex, arc-resistant, back and side-wired, 3-wire grounding type. NEMA reference 5-20R.
   3. Receptacle and wall plates shall be as follows:
      a. Flush mounted white receptacle “Heavy Duty” grade white 302 stainless steel wall plate with matching screws in finished areas.
      b. Flush-mounted receptacles in all other areas shall be gray with 302 stainless steel wall plates.
      c. Surface-mounted receptacles shall be gray and have castcopper-free aluminum FS or FD single or multiple gang boxes with matching cast aluminum cover plate.
   4. "Heavy Duty" grade type 5362, Fed. Spec. W-C-596 compliant, NEMA reference 5-20R.

5. Locations as indicated.
6. When indicated provide GFCI type as specified in this Section.

C. Flush-Mounted and Surface-Mounted UPS Receptacles:
1. Rated 20A at 125Vac.
2. Duplex, arc-resistant, back and side-wired, 3-wire grounding type.
3. Receptacle and wall plates shall be as follows:
   a. Flush-mounted receptacles in all other areas shall be red with 302 stainless steel wall plates.
   b. Surface-mounted receptacles shall be red and mounted in cast copper-free aluminum FS or FD single or multiple gang boxes with matching cast aluminum wall plate.
4. "Heavy Duty" grade type 5362, Fed. Spec. W-C-596 compliant. NEMA reference 520R.
5. Locations as indicated.

D. Ground Fault Circuit Interrupter (GFCI) Receptacles:
1. Flush or surface mounted as indicated.
2. Rated 20A at 125Vac, Fed. Spec. W-C-596.
3. Back and side wired terminals with feed-through design.
   a. Terminal installation unless indicated otherwise.
4. UL Standard 943 Class A, Group 1.
5. Leakage current sensitivity: 5 mA ±1 mA.
   a. Opens circuit within 25 milliseconds of reaching 5 mA.
6. Duplex, arc resistant and pre wired.
7. Cover plate materials and colors shall match standard receptacles as specified this Section.
8. FD box.
9. Locations as indicated.

E. Weatherproof Receptacles:
1. Flush or surface mounted as indicated.
2. Rated 20A at 125Vac, Fed. Spec. W-C-596. NEMA reference 520R.
3. GFCI receptacle as specified in this Receptacles Section when indicated.
4. Provide a gray receptacle with a cast aluminum weather-proof cover.
   a. Provide while in use cover for outdoor locations.
   b. Provide hinged self-closing, gasketed type covers for indoor damp locations.
5. FS or FD boxes.
6. Locations as indicated.

F. Twist Locking Receptacles:
1. Flush or surface mounted as indicated.
2. Rated 20A or 30A as required at 125Vac, NEMA reference L5-20 L5-30.
3. Cover plate materials and colors shall match standard receptacles as specified this Section.
4. Provide matching plug assembly when required for application indicated. Coordinate with Plugs this Section.

G. Surface-Mounted Explosion Proof Receptacle:
1. Rated 20A, 125V, 3-wire grounding type (NEMA 5-20R configuration).
2. Provide Feed-through design.
3. Cast copper-free aluminum housing
4. Top cover shall be hinged and spring loaded.
5. Receptacle shall incorporate a plug interlocking mechanism to prevent accidental disengagement while in use.

a. Receptacle interlocking mechanism shall not engage until the plug is fully inserted.

6. Provide a matching quick wiring plug for each receptacle provided.
   a. Plug shall be compatible with standard NEMA style receptacles.
7. Rated for service in Class I, Divisions 1 and 2, Groups C and D areas.
8. Must bear a label. Comply with UL 1203, UL 1682, and UL 1686 as applicable.

H. Special Receptacles:
1. Provide with ratings as indicated.
2. For flush mounted applications provide a gray receptacle with 302 stainless steel wall plate for flush mounted applications.
3. Provide with cast copper-free aluminum FS or FD single or multiple gang boxes with matching aluminum cover plate for surface mounted applications.
4. Provide with a NEMA 4X stainless steel mounting enclosure sized for the receptacle and necessary cable terminations.
5. Mounting hardware and cover screws shall be stainless steel.

I. Floor Receptacles:
1. Modular, above-floor service outlets and fittings of types and ratings indicated. Construct of cast aluminum. Use design compatible with floor outlet wiring methods indicated. Provide 20-ampere, 125V, 2-pole, 3-wire, grounding, gray duplex receptacles, NEMA configuration 5-20R. Provide with 3/4-inch or 1-inch NPT, 1-inch long, locking nipple for conduit installation.

J. Poke-Through Assembly Devices:
1. Factory-fabricated poke-through assembly devices with modular, flush (not 4-hour fire rated) or above-floor service outlets (as required), multi-channeled thru-floor raceway/fire stop assembly and below-floor junction box assembly. Construct above floor service fitting (or flush carpet flange) of die cast, satin finished aluminum with 20-ampere, 125V, 2-pole, 3-wire, grounding gray duplex NEMA 5-20R receptacle and modular communication/data service outlet with separation barrier between power and low-voltage section. Provide integral assembly UL listed as a total unit, with fire rating of 1, 1.5, 2, or 4 hours as required to be consistent with that of floor penetrated.

K. USB Charging Receptacles:
1. Rated 20A at 125Vac, NEMA 5-20R receptacle with two integral USB charging ports. “Heavy Duty” grade, arc-resistant, back and side-wired, 3-wire grounding type.
2. Shall comply with UL 94 for 5V flammability rating.
3. Shall comply with battery charging specification USB BC.1.2 and UL 1310.
4. Shall be compatible with USB 1.1/2.0/3.0 devices.
5. USB ports shall be rated 5Vdc, 2.1A each.
6. Cover plate materials and colors shall match standard receptacles as specified this Section.
7. Install where indicated.

2.03 SWITCHES:

A. General:
1. All switches and associated materials shall bear a UL 20 label and comply with NEMA WD 1.
2. Provide all necessary wiring and accessories as required for complete installation.

B. All single-pole, double-pole, three-way, and four-way switches as indicated.

C. Flush-Mounted, Tumbler, Self-Grounding, Heavy-Duty Switches:
1. Rated 20A at 120 or 277Vac.
2. Quiet type.

3. "Heavy Duty" grade.
4. White toggle and Industrial grade white 302 stainless steel wall plate with matching screws in finished areas.
5. Gray toggle in all other areas with 302 stainless steel wall plates.
6. Back and side wired design.
   a. Screw terminal installation unless indicated otherwise.
7. With grounding lug.

D. Surface-Mounted, Tumbler, Self-Grounding, Heavy-Duty Switches:
1. Rated 20A at 120V or 277Vac.
2. "Heavy Duty" grade switch with gray toggle.
3. FS and FD single or multiple gang cast boxes.
4. Cast aluminum cover plates and matching countersunk screws.
5. Locations indicated.

E. Weatherproof, Self-Grounding, Heavy-Duty Switches:
1. Rated 20A at 120V or 277Vac.
2. Gray toggle.
3. Flush or surface mounted as indicated.
4. FS or FD boxes with PVC gasketing.
5. "Heavy Duty" grade.
6. Lever-type, cast aluminum, gasketed cover plate.
   a. Cooper, Crouse-Hinds No. DS185 or engineer approved equal.
7. Locations indicated.

F. Explosion Proof Switches:
1. Enclosure rated for service in Class 1, Division 1 and 2, Groups C and D areas.
2. Heavy-Duty switches rated 20A at 120V or 277Vac.
3. Locations and mounting as indicated.
4. Crouse-Hinds EFS/EFD, Hubbell-Killark FXS, or Engineer-approved equal.
5. Must bear a UL 1203 label.

2.04 PLUGS:

A. Rated 20A at 125Vac.
B. Industrial grade.
C. Provide with cord clamp to accept a cord range as required.
D. Integral cable grip with offset cable gripping jaws secured with two screws.
E. Grounding type.
F. NEMA WD 6 ratings to match associated source receptacle.
G. Provide for locations indicated.

2.05 SWITCH RATED PLUGS AND RECEPTACLES:

A. Meltric Type DSN and DS Switch-Rated Type Plugs & Receptacles.
1. Plugs and receptacles shall be listed to UL 2682 'Switch Rated Plugs and Receptacles'.
2. Plugs and receptacles shall have constant pressure butt-contacts with solid silver-nickel tips. Pin and sleeve contacts are not permitted.
3. Receptacles shall have dead front construction: live parts shall be inaccessible to thin tool or wire.
4. Plugs and receptacles rated 100A and below shall be able to close at least once into a conditional short-circuit current of up to 65,000A when protected by an RK1 fuse sized no greater than 400% of the highest full load motor current associated with the device. Plugs and receptacles rated higher than 100A shall be able to close into a short-circuit

with available fault current of 10,000A when protected by an RK1 fuse sized no greater than 400% of the highest full load motor current associated with the device.

5. Plugs and receptacles shall incorporate an integral switching mechanism to ensure the load is broken before the plug is removed from the receptacle.
6. Plug and receptacle wire terminals shall be spring-assisted to prevent loosening due to conductor yielding, shocks, vibrations or thermal cycling.
7. The minimum environmental rating of plugs and receptacles shall be Type 3R (DS Series), Type 4X and IP66/IP67/IP69k (DSN Series).
8. Ingress protection shall be achieved automatically when the plug is fully inserted into the receptacles, without additional manual operation.
9. Plugs and receptacles shall have a system of different keying positions in order to discriminate between circuits or incompatible operating voltages or frequencies.
10. Plugs and receptacles installed outdoors shall be able to withstand UV radiation.
11. Plugs and receptacles shall be MELTRIC Switch-Rated Series or engineer approved equal.

B. Meltric Type DXN Hazardous Location Type Plugs and Receptacles.

1. Plugs and receptacles shall be UL or CSA rated for Class I Division 2 Group A, B, C, D and Class II Division 2 Group E, F, G environments.
2. Plugs and receptacles shall be rated to ATEX II 2 G/D DUST T85 EEx ed IIC T6.
3. The minimum environmental rating of plugs and receptacles shall be IP66/IP67. Ingress Protection shall be achieved automatically when the plug is fully inserted into the receptacles, without any additional manual operation.
4. Receptacles shall have a dead front, live parts shall be inaccessible to a thin tool or wire.
5. Plugs and receptacles shall have constant pressure butt-contacts with solid silver-nickel contact tips. Pin and sleeve contacts are not permitted.
6. Plugs and receptacles shall be able to safely connect and disconnect equipment under full load in potentially explosive environments.
7. Hazardous duty rated plugs and receptacles shall be MELTRIC DXN Series or engineer approved equal.

C. Meltric Type DR Series Type Plugs & Receptacles.

1. Plugs and receptacles shall have constant pressure butt-contacts with solid silver-nickel tips. Pin and sleeve contacts are not permitted.
2. Receptacles shall have dead front construction: live parts shall be inaccessible to thin tool or wire.
3. Plugs and receptacles shall incorporate an integral load break mechanism to ensure the load is broken before the plug is removed from the receptacle.
4. Plug and receptacle wire terminals shall be spring-assisted to prevent loosening due to conductor yielding, shocks, vibrations or thermal cycling.
5. The minimum environmental rating of plugs and receptacles shall be Type 3R. Ingress protection shall be achieved automatically when the plug is fully inserted into the receptacles, without additional manual operation.
6. Plugs and receptacles shall have a system of different keying positions in order to discriminate between circuits or incompatible operating voltages or frequencies.
7. Plugs and receptacles installed outdoor shall be able to withstand UV radiation.
8. Plugs and receptacles shall be MELTRIC DR Series or engineer approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General:
   1. Install wiring devices and accessories in accordance with manufacturer's written instructions, and in accordance with recognized industry practices.
   2. Coordinate with other work, including painting, electrical boxes, and wiring installation.
   3. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for wiring devices. Where manufacturer's torqueing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL 486A-486B.
   4. Install wiring devices only in electrical boxes which are clean - free from building materials, dirt, and debris.
   5. Painting work shall be completed prior to device wall plate installation.

B. Receptacles:
   1. Mount receptacles outlets 1'-6" (450 mm) above floor, walkways, or finished grade unless indicated otherwise.

C. Switches:
   1. Mount 4 feet (1.2 meters) above floor, walkways, or finished grade unless indicated otherwise.
   2. Install close to trim on lock side when located near doors.

D. Wiring Circuits:
   1. Home Run Groupings:
      a. Group in home runs with not more than one conductor of each phase and 100% sized neutral and ground wire in one conduit.
      b. Circuits which are protected by ground fault circuit interrupter (GFCI) devices shall use their own separate and isolated neutral between the GFCI device and load.
   2. Use circuit numbers as indicated.
   3. Use type SVN3 wire for lighting and receptacle circuits unless indicated otherwise.
   4. Do not install wire smaller than No. 12 AWG.
   5. Install larger size wire as indicated or required to conform to requirement of NFPA 70 (NEC).
   6. Install in concealed and exposed conduit systems as indicated.

3.02 IDENTIFICATION:

A. Comply with Section 26 05 53 – Identification for Electrical Systems.

B. Identify each receptacle with panelboard identification and circuit number. Use hot stamped or engraved machine printing with black-filled lettering on face of plate and durable wire markers or tags inside outlet boxes.

C. Controlled receptacles shall be identified with controlled receptacle marking symbol complying with requirements in NFPA 70.

3.03 PROTECTION:

A. Protect installed devices from damage.

B. Devices and wall plates that are damaged, stained, or painted shall be replaced prior to final acceptance.

3.04 FIELD QUALITY CONTROL:

A. Testing:

1. Prior to energizing circuits, test wiring for electrical continuity and for short-circuits. Ensure proper polarity of connections is maintained.
2. After circuits are energized, test wiring devices and demonstrate compliance with requirements.
    a. Test each receptacle with a receptacle tester to ensure proper polarity.
    b. Test ground fault circuit interrupters with the local test button and with a receptacle tester to simulate a remote ground fault.
    c. Verify the phase rotation is identical on all multi-phase receptacles.

END OF SECTION 26 27 26

SECTION 26 28 13 - FUSES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Cartridge fuses rated 600 V ac and less for use in the following:
    a. Control circuits.
    b. Motor-control centers.
    c. Panelboards.
    d. Switchboards.
    e. Enclosed controllers.
    f. Enclosed switches.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.03 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Eaton (Bussmann).
B. Littelfuse.
C. Mersen (Gould/Ferraz).

2.02 CARTRIDGE FUSES

A. Characteristics: NEMA FU 1, current-limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.
    1. Type RK-1: 250 or 600-V as required, zero- to 600-A rating, 200 kAIC, time delay.
    2. Type RK-5: 250 or 600-V as required, zero- to 600-A rating, 200 kAIC, time delay.
    3. Type CC: 600-V, zero- to 30-A rating, 200 kAIC, time delay.
    4. Type CD: 600-V, 31- to 60-A rating, 200 kAIC, time delay.
    5. Type J: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
    6. Type L: 600-V, 601- to 6000-A rating, 200 kAIC, time delay.
    7. Type T: 250-V, zero- to 1200-A or 600-V, zero- to 800-A rating as required, 200 kAIC, time delay.
B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
C. Comply with NEMA FU 1 for cartridge fuses.
D. Comply with NFPA 70.
E. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.

B. Install spare-fuse cabinet(s) in location shown on the Drawings.

3.02 IDENTIFICATION

A. Install labels complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems" and indicating fuse replacement information inside of door of each fused switch and adjacent to each fuse block, socket, and holder.

END OF SECTION 26 28 13

SECTION 26 29 13 –ENCLOSED CONTROLLERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies starters, contactors, push buttons, switches, indicating lights, relays, and motor controller work as indicated and specified.

1.03 RELATED REQUIREMENTS:

A. Refer to applicable Division 26 Sections for wires/cables, grounding, identification, electrical raceways, and boxes and fittings required in connection with enclosed controllers.
B. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
C. Section 26 05 33 – Raceways, Boxes, Seals, and Fittings for Electrical Systems.
D. Section 26 05 53 – Identification for Electrical Systems.

1.04 REFERENCE STANDARDS:

A. National Electrical Manufacturers Association (NEMA):
   1. NEMA 250 – Enclosures for Electrical Equipment (1,000V Maximum).
   2. NEMA AB 1 – Molded-Case Circuit Breakers.
   3. NEMA ICS 1 – General Standards for Industrial Control Systems.
   4. NEMA ICS 2 – Industrial Control Devices, Controllers, and Assemblies.
   5. NEMA ICS 3 – Industrial Systems.
   6. NEMA ICS 6 – Enclosures for Industrial Controls and Systems.
   7. NEMA KS 1 – Enclosed Switches.
   8. NEMA MG1 – Motors and Generators.
B. National Electrical Contractor's Association (NECA):
   1. NECA NEIS 1 - Standard for Good Workmanship in Electrical Construction.
C. National Fire Protection Association (NFPA):
   1. NFPA 70 – National Electrical Code (NEC): Comply with applicable local electrical code requirements of the authority having jurisdiction and NEC Articles 200, 250, 430 and 702 as applicable to installation and construction of enclosed controllers.
D. Underwriters Laboratories (UL): Provide controllers and components which are UL-listed and labeled.
   1. UL 50 – Enclosures for Electrical Equipment.
   2. UL 98 – Enclosed and Dead-Front Switches.
   3. UL 486A – Wire Connectors and Soldering Lugs for Use with Copper Conductors.
   4. UL 489 – Molded Case Circuit Breakers, Molded-Case Switches and Circuit Breaker Enclosures.
   5. UL 508 – Electric Industrial Control Equipment.

1.05 DEFINITIONS:

A. CPT: Control power transformer.
B. MCCB: Molded-case circuit breaker.
C. MCP: Motor circuit protector.
D. N.C.: Normally closed.
E. N.O.: Normally open.

F. OCPD: Overcurrent protective device.
G. SCR: Silicon-controlled rectifier.

1.06 SUBMITTALS:

A. Refer to Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for Submittals.
B. Includes, but not limited to, the following:
   1. Product Data: Submit manufacturer's data and installation instructions on motor controllers, contactors, push buttons, selector switches, indicating lights and relays.
   2. Shop Drawings: Submit Shop Drawings of motor controllers showing dimensions and weights. Submit dimensional data on push buttons, selector switches, indicating lights and relays.
      a. Show tabulations of the following:
         (1) Each installed unit's type and details.
         (2) Factory-installed devices.
         (3) Nameplate legends.
         (4) Short-circuit current rating of integrated unit.
         (5) Features, characteristics, ratings, and factory settings of individual OCPDs in combination controllers.
   3. Wiring Diagrams: Submit power and control schematic and wiring diagrams for motor controllers and contactors. Differentiate between portions of wiring which are manufacturer factory installed and portions which are field-installed.
   4. Field quality-control reports.
   5. Load-Current and List of Settings of Adjustable Overload Relays: Compile after motors have been installed and arrange to demonstrate that switch settings for motor running overload protection suit actual motors to be protected.
C. Closeout Submittals:
   1. Information listed above.
   2. Operation and Maintenance Data: Include the following as minimum:
      a. “As-Built” drawings.
      b. Field quality-control reports.
      c. Warranty information.
      d. Routine maintenance requirements for enclosed controllers and installed components.
      e. Manufacturer's written instructions for testing and adjusting circuit breaker and MCP trip settings.
      f. Manufacturer's written instructions for setting field-adjustable overload relays. Include installed and operating load current with list of settings.
      g. Manufacturer's written instructions for testing, adjusting, and reprogramming reduced-voltage solid-state controllers.
D. Maintenance Material Submittals:
   1. Spare Parts:
      a. One spare LED indicating lamps for each type and color used.
      b. One spare indicating light assembly.
      c. Ten spare power and control fuses of each voltage and current rating used.
   2. All parts supplied with the equipment shall be properly labeled for ease of identification and to permit the shortest possible time to repair.

1.07 PRODUCT DELIVERY, STORAGE, AND HANDLING:

A. Deliver Equipment and components properly packaged in factory-fabricated type containers.
B. Store Equipment and components in original packaging and in a clean dry space; protect from weather and construction traffic.
C. Handle Equipment and components carefully to avoid breakage, impact, denting, and scoring of finishes. Do not install damaged Equipment; replace and return damaged units to Equipment manufacturer.

1.08 COORDINATION, SEQUENCING AND SCHEDULING:

A. Sequence equipment installation work with other work to minimize possibility of damage and soiling during remainder of construction period.
B. Coordinate layout and installation of enclosed controllers with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

1.09 QUALITY ASSURANCE:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Subject to compliance with requirements, provide motor controllers, contactors, push buttons, switches, indicating lights, and relays of one of the following:
   1. Eaton.
   2. ABB.
   3. Schneider Electric.
   4. Siemens.

2.02 COMBINATION MAGNETIC MOTOR STARTERS:

A. Full-voltage, non-reversing, reversing or two speed, NEMA style, with motor circuit protector (MCP) type disconnect.
B. Minimum NEMA Size 1.
C. Motor Circuit Protector:
   1. Shall be provided with an external handle that clearly indicates when the MCP is "ON," "OFF," or "TRIPPED" and be lockable in the "OFF" position.
   2. Molded-case, manually-operated, 3-pole.
   3. Adjustable, instantaneous-trip, magnetic-only-type circuit breaker.
   4. Coordinated unit rating for circuit protector and starter.
D. Interrupting rating RMS Symmetrical as required.
E. Provide with solid-state, self-powered overload relay sized for and adjusted to full load current of motor being protected. Overload relay shall be manually reset and provide phase loss protection.
F. External manual reset of overload relay from outside of the enclosure.
G. Built-in 480/120V control transformer on 480V units of adequate capacity for all control devices as indicated on Contract Drawings.
H. Auxiliary contacts as required by Contract Drawings.

I. Momentary or maintained start-stop push buttons, selector switches, control switches, control relays, and indicating lights to implement control sequence indicated.
   1. Heavy duty, 30 mm units.
   2. Start push buttons shall have a green operator.
   3. Stop push buttons shall have a red operator.
   4. 120Vac cluster LED, push to test type indicating lights.
   5. Red lights shall indicate “Equipment On”.
   6. Green lights shall indicate “Equipment Off”.
   7. Amber lights shall indicate “Equipment Failure”.

2.03 REDUCED-VOLTAGE SOLID-STATE CONTROLLERS:

A. General Requirements for Reduced-Voltage Solid-State Controllers: Comply with UL 508.

B. Factory-assembled combination of reduced-voltage solid-state controller, OCPD, and disconnecting means for use with 3-phase squirrel cage induction motors.

C. MCP Disconnecting Means:
   1. UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
   2. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.
   3. Auxiliary contacts "a" and "b" arranged to activate with MCP handle.

D. Reduced-Voltage Solid-State Controllers: An integrated unit with power SCRs, heat sink, microprocessor logic board, door-mounted digital display and keypad, shorting contactor, and solid-state overload relay; suitable for use with NEMA MG 1, Design B, polyphase, medium induction motors.
   1. Configuration: Standard duty; nonreversible.
   2. Starting Mode: Provide a smooth, stepless acceleration of a three-phase induction motor.
   3. Be capable of linear voltage ramp or current limit start.
   4. Have current limit capability adjustable between 150% and 450% of motor full load current.
   5. Have an adjustable ramp time between 0.5 and 60 seconds.
   6. Provide an adjustable soft stop capability to decelerate a motor over an adjustable time between 0 and 60 seconds.
   7. Shorting Contactor: Operates automatically when full voltage is applied to motor, and bypasses the SCRs. Solid-state controller protective features shall remain active when the shorting contactor is in the bypass mode.
   8. Shorting Contactor Coils: Pressure-encapsulated type; manufacturer's standard operating voltage, matching control power or line voltage, depending on contactor size and line-voltage rating. Provide coil transient suppressors.
   9. Have shorted SCR detection which shall inhibit starting or shut down the controller if one or more shorted SCRs are detected.
   10. Have an ambient operating air temperature range of -5ºC to +50ºC without derating.
   11. Be operable in relative humidity of 5-95%, non-condensing.
   12. Logic Board: Identical for all ampere ratings and voltage classes, with environmental protective coating.
   13. Control Circuits: 120Vac; obtained from integral CPT, with primary and secondary fuses of sufficient capacity to operate integral devices. CPT shall be sized to include the load of the motor heater.
      a. CPT Spare Capacity: 100 VA.

14. Keypad, front accessible; for programming the controller parameters, functions, and features; shall be manufacturer's standard and include not less than the following functions:
    a. Adjusting motor full-load amperes, as a percentage of the controller's rating.
    b. Adjusting current limitation on starting, as a percentage of the motor full-load current rating.
    c. Adjusting linear acceleration and deceleration ramps, in seconds.
    d. Initial torque, as a percentage of the nominal motor torque.
    e. Adjusting torque limit, as a percentage of the nominal motor torque.
    f. Adjusting maximum start time, in seconds.
    g. Adjusting voltage boost, as a percentage of the nominal supply voltage.
    h. Selecting stopping mode, and adjusting parameters.
    i. Selecting motor thermal overload protection class between 5 and 30.
    j. Activating and de-activating protection modes.
    k. Selecting or activating communication modes.
15. Digital display, front accessible; for showing motor, controller, and fault status; shall be manufacturer's standard and include not less than the following:
    a. Controller Condition: Ready, starting, running, stopping, auto mode, manual mode.
    b. Motor Condition: Amperes, voltage, power factor, power, and thermal state.
    c. Fault Conditions: Controller thermal fault, motor overload alarm and trip, motor under-load, overcurrent, shorted SCRs, line or phase loss, phase reversal, and line frequency over or under normal.
16. Push Buttons and Selector Switches:
    a. Heavy-duty 30 mm units with contacts rated 10A continuous at 120Vac.
    b. NEMA 4X rated.
    c. Provide the number of contacts and contact development as indicated.
    d. Start push buttons shall have red operators.
    e. Stop push buttons shall have green operators.
17. Pilot Lights:
    a. Heavy-duty, 30 mm units.
    b. NEMA 4X rated.
    c. 120Vac cluster LED type.
    d. Amber lights shall indicate equipment failure.
    e. Push-to-test type.
    f. Include general indication for:
        (1) Motor Faults
18. Controller Diagnostics and Protection:
    a. Microprocessor-based thermal protection system for monitoring SCR and motor thermal characteristics, and providing controller over-temperature and motor-overload alarm and trip; settings selectable via the keypad.
    b. Protection from line-side reverse phasing; line-side and motor-side phase loss; motor jam, stall, and under-load conditions; and line frequency over or under normal.
    c. Shunt trip that opens the disconnecting means when the controller diagnostics detect a faulted solid-state component.
19. Remote I/O Features:
    a. The following inputs/outputs prewired to terminal blocks.
        (1) Form C status contacts that change state when controller is running.

(2) Form C alarm contacts that change state when a starter fault condition occurs.
(3) Form C status of remote/local switch.
(4) Remote start/stop control.

20. Solid-State Overload Relay:
    a. Self-powered.
    b. Switch or dial selectable for motor running overload protection.
    c. Sensors in each phase.
    d. Tripping characteristic selected to protect motor against voltage and current unbalance and single phasing.
21. External overload reset push button.

2.04 CONTACTORS:

A. Mechanically held contactor.
B. Rated 600Vac.
C. Number of poles: As indicated or required.
D. 30Amp rated contacts unless indicated otherwise.
E. Auxiliary control devices, push buttons, and indicating lights as indicated.
F. Push Buttons and Selector Switches:
    1. Heavy-duty 30 mm units with contacts rated 10A continuous at 120Vac.
    2. NEMA 4X rated.
    3. Provide the number of contacts and contact development as indicated.
G. Pilot Lights:
    1. Heavy-duty, 30 mm units.
    2. NEMA 4X rated.
    3. 120Vac cluster LED push-to-test type, with color as indicated.

2.05 CIRCUIT BREAKERS:

A. Rated 480V, 3-phase, 60-hertz, with interrupting ratingRMS Symmetrical as required.
B. External handle which clearly indicates when breaker is "ON," "OFF," or "TRIPPED" and is lockable in the "OFF" position.
C. Molded-case, manually-operated, 3-pole.
D. Trip-free from handle.
E. Inverse time thermal element overload protection.
F. Instantaneous magnetic short-circuit protection on all poles.
G. Provide neutral and grounding lug kit.
H. Shall comply with NEMA AB1 and UL 489.

2.06 SAFETY SWITCHES:

A. Provide as required by NEC, specified or indicated.
B. Positive quick-make, quick-break mechanism, visible blades, and line terminal shield.
C. Single throw or double throw type when specified for source or load transfer.
D. Provide number of poles as indicated.
E. Provide auxiliary contacts for interlocking with motor starter or VFD when indicates. Contact quantity as required.
F. Furnish heavy duty type.
G. Shall comply with NEMA KS 1 and UL 98.
H. Short circuit rating as required.

2.07 ENCLOSURES:

A. Enclosed Controllers: NEMA ICS 6, to comply with environmental conditions at installed location.

B. Unless otherwise indicated, provide enclosed controllers with the following NEMA enclosure ratings:

1. NEMA 4X, stainless steel enclosures for outdoor areas.
2. NEMA 4X, stainless steel enclosures for process areas.
3. NEMA 12 enclosures for interior finished areas and electrical rooms.
4. NEMA 7 for classified locations.

2.08 CONTROL STATIONS:

A. Heavy duty, 30 mm push buttons and selector switches with number of contacts as required. Contacts shall be rated a minimum of 10 Amps at 120Vac.

B. Start push buttons shall have a green operator.

C. Stop push buttons shall have a red operator.

D. Emergency Stop push buttons shall have red mushroom head operators.

E. Unless otherwise indicated, provide control stations with the following NEMA enclosure ratings:

1. NEMA 4X, 304-stainless steel enclosures for outdoor and process areas.
2. NEMA 7, cast aluminum, explosion proof enclosure for classified locations.
3. NEMA 12 enclosures for interior finished areas and electrical rooms.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and surfaces to receive enclosed controllers, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.

B. Examine enclosed controllers before installation. Reject enclosed controllers that are wet, moisture damaged, or mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

A. Wall-Mounted Controllers: Install enclosed controllers on walls with tops at uniform height unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall.

B. For controllers not at walls, provide freestanding racks complying with Section 26 05 33 – Raceways, Boxes, Seals, and Fittings for Electrical Systems.

C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

D. Comply with NECA 1.

E. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Standard 468A and the National Electrical Code.

3.03 IDENTIFICATION:

A. Identify enclosed controllers, components, and control wiring. Comply with requirements for identification specified in Section 26 05 53 – Identification for Electrical Systems.
   1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
   2. Label each enclosure with engraved nameplate.
   3. Label each enclosure-mounted control and pilot device.

3.04 GROUNDING:

A. Provide equipment grounding connections for motor controller and control equipment as indicated. Tighten connections to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounding.
B. Grounding shall conform to Section 26 05 26 – Grounding and Bonding for Electrical Systems.

3.05 FIELD QUALITY CONTROL:

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
B. Acceptance Testing Preparation:
   1. Test insulation resistance for each enclosed controller, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.
C. Tests and Inspections:
   1. Inspect controllers, wiring, components, connections, and equipment installation.
   2. Test insulation resistance for each enclosed-controller element, component, connecting motor supply, feeder, and control circuits.
   3. Test continuity of each circuit.
   4. Check all equipment grounds for continuity.
   5. Remove all blocking used for shipments.
   6. Verify that voltages at controller locations are within ±10% of motor nameplate rated voltages. If outside this range for any motor, notify Engineer before starting the motor(s).
   7. Test each motor for proper phase rotation.
   8. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   9. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
D. Enclosed controllers will be considered defective if they do not pass tests and inspections.
E. Prepare test and inspection reports including a certified report that identifies enclosed controllers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.06 ADJUSTING AND CLEANING:

A. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.
B. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable instantaneous trip elements. Initially adjust to six times the motor nameplate full-load ampere ratings and attempt to start motors several times, allowing for motor cooldown between starts.

If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify Engineer before increasing settings.

C. Set field-adjustable switches and program microprocessors for required start and stop sequences in reduced-voltage solid-state controllers.

D. Coordinate with Section 26 05 73 – Power System Studies.

3.07 DEMONSTRATION:

A. Upon completion of installation of motor controller and control equipment and electrical circuitry, energize circuitry and demonstrate functioning of equipment in accordance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and retest to demonstrate compliance.

B. Engage a factory-authorized service representative to train Owner's maintenance personnel to use and reprogram microprocessor-based, reduced-voltage solid-state controllers.

C. Replace controllers whose interiors have been exposed to water or other liquids prior to Substantial Completion.

END OF SECTION 26 29 13

SECTION 26 29 23 – VARIABLE FREQUENCY MOTOR CONTROLLERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes variable frequency drives (VFD) and associated equipment.
B. Every variable frequency drive system shall consist of all system components required to meet the performance, protection, safety, testing, and certification criteria of this specification.
C. The VFD system must:
   1. Represent a fully integrated package. Any components not manufactured by the VFD manufacturer shall be purchased by the VFD manufacturer and supplied with the VFD.
   2. Include all material and labor necessary to interconnect any VFD system elements, even if shipped separately including input harmonic filters.
D. Any modifications to a standard product provided to meet this specification shall be performed by the VFD manufacturer only.
E. The VFD system shall be completely factory pre-wired, assembled and then tested as a complete package by the VFD manufacturer, to assure a properly coordinated, fully integrated drive system.
F. Any third party certification, safety or protection requirements shall be applied to the VFD system as a whole. Certification or protection of system elements or individual components by themselves is not acceptable.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems
B. Section 26 05 53 – Identification for Electrical Systems

1.04 REFERENCE STANDARDS:

A. Provide equipment in full accordance with the latest applicable rules, regulations, and standards of:
   1. National Electric Code (NEC).
   2. Underwriters' Laboratories (UL).
   3. American National Standards Institute (ANSI).
   4. National Electrical Manufacturers Association (NEMA).
   5. Institute of Electrical and Electronics Engineers (IEEE).
      a. IEEE 519: Recommended Practice and Requirements for Harmonic Control in Electric Power Systems.
   6. Federal Communications Commission (FCC).

1.05 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.
B. Submittals shall be custom prepared by the VFD system manufacturer for this specific application.
C. Product Data: Submit for each type of product specified and included, with the following as minimum:
   1. Data sheets for all components furnished as part of the system package.
D. Shop Drawings: Provide the following as minimum:

1. Equipment dimensions, including stub-up locations, shipping splits and shipping weights.
2. Block diagram showing the basic control and protection systems specifying the protection, control, trip and alarm functions at the different locations, the reference signals and commands and the auxiliary supplies.
3. Electrical one-line diagram showing main and auxiliary circuitry, including main power input, VFD system grounding and auxiliary supplies.
4. Wiring diagrams, including external connection terminals.
5. Certifications.
6. Provide documentation on communication system interface along with a complete list of all available parameters and associated addresses.
7. Provide paper documentation of the programmable logic controller program.

E. Seismic Qualification Certificates: Submit certification that switchboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 26 05 48 - Vibration and Seismic Controls for Electrical Systems. Include the following:
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assemble components or on calculation.
   2. Dimensioned Outline Drawing of Equipment Unit: Identify center of gravity and locate describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

F. Special Procedure Submittals:
   1. Start-up and commissioning instructions.
   2. Syllabus for Owner training.

G. Test and Evaluation Reports:
   1. Factory test reports.
   2. Efficiency and power factor values.
   3. Field test reports.

H. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Operation and maintenance manuals for all components furnished.
      b. Certified “As-Built” drawings of all equipment with information listed above.
      c. Copies of all approved Product Data.
      d. Copies of all approved Test Reports.
      e. Spare parts and supply list with supplier names and part numbers.
      f. Warranty Information.
      g. Manufacturer’s service and repair support during and after warranty including contact information.
      h. Training Materials. Includes final edited training videos.

I. Maintenance Material Submittals:
   1. Spare Parts:
      a. Three spare LED indicating lamps for each type and color used.
      b. Three spare indicating light assemblies.
      c. Three spare power and control fuses of each voltage and current rating used.
   2. Software:
      a. Soft copy of PLC programs including all programming comments.
      b. Organize and submit software on a USB flash drive.

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use for at least one year prior to Bid opening.

B. Qualifications:
   1. The VFD manufacturer shall be able to demonstrate experience in manufacturing VFDs to demonstrate their capability to provide parts and service support.
   2. It is the intention of this specification to purchase dependable and reliable equipment offering the best performance available from currently proven technology. All equipment furnished under this contract must, therefore, have documentation showing proof of actual operation in similar service.

C. Factory Tests:
   1. The manufacturer shall conduct tests according to industry standard requirements.
   2. Perform factory tests on all VFD assemblies to assure that all devices and systems are in proper working order before delivery to jobsite.
   3. Test all power, control and communication systems for proper operation.
   4. Simulate actual system operation.
   5. System Level Tests:
      a. The system shall be given preliminary checks including verification of electrical connections including ground connections, power and control wiring shall be resistance checked point-to-point.
      b. Firmware shall be checked for correct revision level.
      c. Visual check shall be performed to verify: degree of protection for cabinets, input isolation is lockable in the off-position, marking of terminals and wiring, space availability for cable termination, accessibility of components and ease of maintenance and repair.
      d. The VFD system shall be fully checked against the approved drawings for compliance and correct physical dimensions.
      e. All control voltage levels are to be checked and verified.
      f. A no load test is to be performed on the system.
      g. Drive is to be connected to an unloaded motor and feedback signals shall be verified.
      h. Output voltage shall be calibrated.
      i. All logic and interlocks including customer logic and instrumentation shall be tested.
   6. Submit test reports as specified in Division 01.

D. VFDs shall be manufactured, assembled, tested and provided with a UL label.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. The VFD system shall be delivered to the site pre-assembled and wired with all specified interconnecting wiring and cable. Cabling for connection across shipping splits shall be neatly coiled and identified. Exposed sections of equipment shall be fully protected from damage during shipment. All necessary hardware for reconnecting shipping splits shall be provided.

B. The VFD system manufacturer shall be responsible for all system interconnections across shipping splits at the site.

C. Complete instructions for handling and storage shall be provided prior to delivery of the equipment. All equipment shall have adequate provisions for handling by overhead crane or fork lift truck.

D. VFDs shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants. Store at secured and insured warehouse location.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install the VFD equipment specified herein until designated installation spaces are suitable for intended service.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing the VFDs and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. All equipment furnished under this section shall be warranted by the contractor and the equipment manufacturer(s) for a minimum period of five years after completion of startup.

B. Warranty shall include all parts, labor, and expenses to perform necessary work.

1.10 MAINTENANCE:

1. All maintenance materials supplied with the equipment shall be properly labeled for ease of identification and to permit the shortest possible time to repair.
2. Any parts that come from a sub-supplier shall be labeled with that manufacturer's name and part number.
3. Manufacturer shall state closest point where spare parts are stocked and where service can be obtained.
4. Manufacturer shall warrant that all parts shall be available for a minimum of ten years.
5. Maximum response time for trouble calls shall be two hours.
6. A qualified service technician shall be onsite within twenty-four hours of a qualified request.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Variable Frequency Drives 0.50 - 50 Horsepower:
   a). ABB.
   b). Allen-Bradley, Rockwell Automation, Inc.
   c). Eaton.
   d). General Electric.
   e). Robicon, Siemens Industry, Inc.
   f). Schneider Electric.

B. Variable Frequency Drives 60 – 500 Horsepower:
   a). ABB.
   b). Allen-Bradley, Rockwell Automation, Inc.
   c). General Electric.
   d). Robicon, Siemens Industry, Inc.
   e). Schneider Electric.

2.02 CONSTRUCTION:

A. General Requirements:
   1. VFD shall be microprocessor based and utilize Pulse Width Modulation (PWM) for speed control of an induction motor.

2. The VFD shall utilize Insulated Gate Bipolar Transistors (IGBT's).
    a. The VFD shall be sized to operate the indicated motor. Loads driven by VFD are variable torque unless indicated otherwise. Constant torque loads are indicated on the Contract Drawings.
3. The VFD shall be capable of producing a variable AC voltage/frequency output to provide continuous operation of a standard induction motor over a 5-100% speed range.
4. As a commissioning and troubleshooting feature, the VFD power circuit shall be capable of operating without a motor connected to the VFD output.
5. VFD rated for variable torque loads shall be capable of a momentary overload of 110% for one minute.

B. Input Harmonics:
1. The VFD shall be equipped with an integral 3% or 5% line reactor, as indicated by the Control Diagrams.
2. All VFDs greater than 50 horsepower shall incorporate one of the following topologies:
    a. Eighteen pulse or greater converter and drive isolation transformer.
    b. Designed with active components in the front end converter.
    c. Matrix conversion technology using bidirectional switching over the drive's full power and voltage range for a direct AC to AC conversion.
    d. The total harmonic voltage distortion at the point of common coupling shall be less than 5% and the total demand (current) distortion TDD shall be less than defined by the latest version of IEEE 519 with the following exception. The TDD shall not exceed 12% even when higher limits are allowed. The point of common coupling shall be defined as the bus servicing the feeder breaker to VFD.
    e. The drive isolation transformer, if required, shall meet the following:
        (1) Provide the phase shifting required for the multi-pulse converter.
        (2) Shall be a rectifier grade isolation type with a K-factor of 20 or higher and rated for the drive overload capability.
        (3) Shall have a maximum 115°C rise for 40°C ambient and minimum 220°C insulation.
3. Compliance with harmonic distortion limits shall be verified with field measurements as required in PART 3. Test report shall be submitted as specified in Division 01.
4. The VFD shall be equipped with an EMI/RFI filter.
5. The VFD shall meet local requirements for telephone interference restrictions.

C. Motor Compatibility:
1. Motor life expectancy shall not be compromised in any way by operation with the VFD system. The VFD shall provide motor overload protection in any operating condition.
2. The VFD output waveform shall be suitable for operating a squirrel cage induction motor without derating or requiring additional service factor.
3. The system design shall not have any inherent output harmonic resonance in the operating speed range.
4. The VFD output shall produce no electrically-induced, pulsating torque to the output shaft of the mechanical system eliminating the possibility of exciting a resonance caused by VFD induced torque pulsations.
5. The VFD shall protect the motor from high-voltage dv/dt stress which would cause insulation breakdown of an "inverter ready" motor. If the VFD requires an output filter to meet this requirement, it shall be an integral part of the VFD system and be included within the VFD enclosure.
6. As a minimum, an output filter shall be provided:

a. The output filter shall be designed to eliminate reflective waves and convert the PWM wave form to a near sinusoidal wave form.
b. Shall eliminate torque ripple and voltage wave reflection.
c. Designed for use with a wide range of carrier frequencies from 2kHz to 12kHz.
d. Short Term Overload Rating for 200% of rated current for a minimum of 3 minutes.
e. Insulation System shall be Class R (220°C) as minimum.
f. Temperature Rise of 115°C.
g. Ambient temperature rating of 40°C enclosed panel or 50°C open panel.
h. Voltage Distortion < 5% (typical).
i. UL listed.

D. VFD System Efficiency:
1. Guaranteed minimum total VFD system efficiency (η_{sys}) shall be a minimum 96% at 100% speed. Efficiency evaluation shall include all applicable devices such as the input harmonic filter, isolation transformer, VFD converter, and output filter, as indicated below. Auxiliary controls, such as internal VFD control boards, cooling fans, shall be included in all loss calculations.
2. The VFD system efficiency is as follows: $\eta_{sys} = \eta_{VFD} \times \eta_{tans} \times \eta_{harm} \times \eta_{filter}$

Converter/Inverter (VFD)	η_{VFD}
Isolation Transformer	η_{trans}
Input Harmonic Filter	η_{harm}
Output Filter	η_{filt}

E. System Input Power Factor: VFD system shall maintain a 95% minimum power factor from 30% to 100% of rated speed.
F. Speed Regulation: VFD speed regulation shall be ±0.5% without encoder or tachometer feedback.
G. Sound Level: Maximum allowable audible noise from the VFD system will be 80 dBA at a distance of one meter (3.3 ft) at any speed or load condition. VFD systems with audible noise in excess of this limit shall be provided with sufficient noise abatement treatment to reduce the sound pressure level below 80 dBA.
H. Integral VFD Bypass:
1. A complete factory-wired and tested bypass system consisting of an output contactor and bypass contactor. Overload protection shall be provided in both drive and bypass modes.
2. Door interlocked, padlockable circuit breaker that will disconnect all input power from the drive and all internally mounted options.
3. The drive/bypass shall provide single-phase motor protection in both the VFD and bypass modes.
4. The following operators shall be provided:
a. Bypass Hand-Off-Auto.
b. Drive/Bypass Mode Selector Switch.
c. Bypass fault reset.
5. The following indicating lights (pilot type) shall be provided. A test mode or push-to-test feature shall be provided.
a. Power-On (Ready).
b. Run enable open.
c. Bypass mode selected.
d. Drive running.
e. Bypass running.

f. Drive fault.
g. Bypass fault.

6. The following relay (Form C) outputs from the bypass shall be provided:
   a. System started.
   b. System running.
   c. Drive fault.
7. The digital inputs for the system shall accept 24V or 120Vac (selectable). The bypass shall incorporate an internally sourced power supply and not require an external control power source.
8. Customer Terminal Strip: All drive terminals shall be wired to a separate terminal strip.
9. The remote start/stop contact shall operate in VFD and bypass modes.
10. Class 20 or 30 (selectable) electronic motor overload protection shall be included.
11. Provide a VFD bypass system for the following VFDs
    a. IPS 200HP Motor #1 VFD.
    b. IPS 200HP Motor #2 VFD.
    c. IPS 200HP Motor #3 VFD.
    d. IPS 125HP Motor #4 VFD
    e. IPS 125HP Motor #5 VFD

2.03 AVAILABILITY AND RELIABILITY:

A. Firing Signals: All internal firing signals, and other communications (which link operational controls with power components such as status and diagnostic signals) shall meet noise immunity and safety requirements as defined by applicable IEEE Standards.
B. Power Sag Ride-Through: The VFD system shall be capable of continuous operation with a 20% voltage sag on the input power line.
C. "Catch-A-Spinning-Load" Capability: The VFD system shall be able to catch and take control of a spinning load if started while rotating equipment is already spinning. Appropriate safeguards shall be included in this operation to prevent damaging torque(s), voltages or currents from impacting any of the equipment. The user shall have the option of employing this feature or disabling it.
D. Auto-Restart Capability: The VFD system shall be capable of automatically restarting in the event of a power failure or drive trip. The VFD system shall provide the user with the choice of automatically restarting or not. The user shall be able to selectively apply this feature to some, but not necessarily all, conditions as determined by the user to be appropriate for the specific application.
E. Ground Fault Withstand: In the event of a ground fault, the VFD shall annunciate the ground fault condition and trip offline to clear the fault. The cause of the shutdown shall be logged to the fault history and be available at the keypad.

2.04 SERVICEABILITY/MAINTAINABILITY:

A. Front Access: The VFD system shall be designed for front access only.
B. Power Component Accessibility: All power components in the converter sections shall be designed for easy removal and accessibility to minimize repair downtime.
C. Marking/Labeling: Sleeve-type wire marker tags or other acceptable means of permanent identification shall be applied to power and control wiring. Individual nameplates shall be provided for all major components of the VFD system.

2.05 PHYSICAL REQUIREMENTS:

A. Environmental Requirements: The VFD system shall be capable of continuous operation in an average ambient temperature between 0°C and 40°C at an elevation up to 3300 feet (1000 meters) above MSL without derating. The VFD system shall also be simultaneously suitable for continuous operation in a maximum humidity between 0 and 95% noncondensing.

B. Heat Dissipation/Cooling System:
   1. The VFD system shall be air-cooled.

C. Enclosure:
   1. All VFD system components including, but not limited to, circuit breaker, line reactor, isolation transformer, and output filters shall be mounted and wired by the VFD system manufacturer in a grounded enclosure meeting the following requirements:
   2. VFD and auxiliary components shall be housed in a NEMA 1 gasketed or NEMA 12 enclosure.
      a. Cabinets and doors shall be fabricated using heavy gauge steel for sturdy construction and dimensional integrity to assure long-term fit and function. All doors shall be gasketed to provide environmental protection and secure fits.
      b. Units shall be provided with air filters covering all air inlets. Inlet air filters shall be 100% washable, with a progressively structured, corrosion-free media. Filters shall be front replaceable (for cleaning) while the VFD is in operation without exposing maintenance personnel to any of the power components.
      c. Paint procedures and materials shall be manufacturer's system designed and proven for resistance to chemical attack in industrial power-house environments.
   3. The enclosure shall be sized and designed for proper heat dissipation or equipped with an external corrosion resistant heat sink.
   4. Access to the VFD keypad and other control devices shall be available without opening the enclosure.
   5. Enclosures shall be designed to avoid harmonic and inductive heating effects. The enclosure shall be designed to shield any outside equipment from interference, enclosing and shielding the complete system to eliminate any radio frequency interference in compliance with FCC Part 18 requirements.

D. Installation/Cabling: All VFD system wiring (power, control and protection) shall be located internally within the VFD system enclosure. If special requirements of the project require that one or more VFD system components must utilize external cabling or connections to complete the VFD system excluding separately mounted input harmonic filter, this cabling and connecting shall be entirely supplied and/or contracted by the VFD system supplier, and approved by the Engineer. All external power conductors (bus or cable) shall be insulated. Power wiring shall be isolated by voltage class. Control and instrument wiring shall be isolated from power wiring.

2.06 PROTECTIVE DEVICES/DIAGNOSTICS:

A. Protective Features and Circuits:
   1. The controller shall include the following alarms and protective features:
      a. Static instantaneous over-current and over-voltage trip.
      b. Under-voltage and power loss protection.
      c. Over-temperature protection.
      d. Electronic motor inverse time overload protection.
      e. When power is restored after a complete power outage, the VFD shall be capable of catching the motor while it is still spinning and restoring it to proper operating speed without the use of an encoder.

2. The VFD system shall be protected from damage due to the following, without requiring an output contactor:
   a. Single-phase fault or three-phase short circuit on VFD system output terminals.
   b. Loss of input power due to opening of VFD input disconnect device or utility power failure during VFD operation.
   c. Loss of one (1) phase of input power.
   d. Motor regeneration due to backspin or loss of VFD input power.
3. The VFD shall be able to withstand the following fault conditions without damage to the power circuit components:
   a. Failure to connect a motor to the VFD output.
   b. VFD output open circuit that may occur during operation.
4. The VFD shall include a customer selectable automatic restart feature. When enabled, the VFD shall automatically attempt to restart after a trip condition resulting from over-current, over-voltage, under-voltage, or over-temperature.
5. The VFD system shall have the user selectable option of programming up to three speed avoidance bands. This gives the user the ability to block out and prevent operation at any undesirable speed, such as one that may be coincident with a mechanical resonance condition.

B. Diagnostics and Fault Recording:
1. The control logic section shall be fully digital and not require analog adjustment pots or fixed selector resistors.
2. Fault log data shall be stored in nonvolatile memory.
3. The VFD shall include a comprehensive microprocessor based digital diagnostic system which monitors its own control functions and displays faults and operating conditions.
4. A "FAULT LOG" shall record, store, and display upon demand, a minimum of the last four fault events.

2.07 INTERFACES:

A. Switches and Lights:
1. Selector switches, pushbuttons and pilot lights shall be provided on the front panel of the unit as indicated and specified.
2. Selector switches, pushbuttons and pilot lights shall be heavy duty 30 mm units with NEMA rating suitable for the specified enclosure. Pilot lights shall be LED push-to-test type.
3. As a minimum the following devices shall be provided:
   a. Local/Off/Remote selector switch.
   b. Start pushbutton.
   c. Stop pushbutton.
   d. Emergency Stop pushbutton.
   e. Running and Off indicating lights.
      (1) Red indicators for Equipment On.
      (2) Green indicators for Equipment Off.
   f. Fault indicating light.
   g. Speed Potentiometer.

B. Keypad and Display:
1. A front panel mounted keypad with integral digital LCD display shall be furnished, capable of controlling the VFD and setting drive parameters. The display shall present all diagnostic message and parameter values in standard engineering units when accessed, without the use of codes. The keypad shall allow the operator to enter exact numerical

settings in standard engineering units. A plain English user menu (rather than codes) shall be provided in software as a guide to parameter setting.

2. As a minimum, the following parameters shall be available for display:
   a. Speed demand in percent.
   b. Output current in amperes.
   c. Output Frequency in hertz.
   d. Output voltage.
   e. Total 3-phase kW output.
   f. Kilowatt hour meter.
   g. Elapsed time running meter.
   h. Run status.
   i. Fault status.
3. Drive parameters shall be factory set in non-volatile memory and re-settable in the field through the keypad. Password security shall be available to protect drive parameters from unauthorized personnel.
4. The keypad module shall contain a "self-test" software program that can be activated to verify proper keypad operations.

C. Hard-Wired I/O and Control Devices:
1. The VFD shall include programmable I/O for application specific configuration. The drive shall be configurable to operate in a local and remote mode. The drive shall provide for the following programmable input/output points to be associated with the control functions:
   a. Digital Inputs:
      (1) Provide a minimum of 6 fully programmable inputs configured, as indicated.
   b. Digital Outputs, Form C Relay (Dry Contract rated a minimum of 2 Amps at 120 Vac);
      (1) Provide a minimum of 2 fully programmable outputs configured, as indicated.
   c. Analog Input:
      (1) One 4-20 mA isolated input to control drive output (motor speed) when indicated.
   d. Analog Output:
      (1) One 4-20 mA isolated output signal representing drive speed and scaled 0-100%.
2. All programming shall initially be performed at the factory and tested at the factory. Specific requirements for the starting and stopping sequences shall be as indicated.
3. The VFD shall have provisions to power auxiliary devices as indicated.
4. Provide terminal blocks, pushbuttons, indicating lights and control relays as indicated, to provide control, indication and isolation of field-mounted devices.
5. The VFD shall be capable of implementing a speed control PID loop to maintain a level pressure setpoint as indicated.

D. Programmable Logic Controller:
1. The VFD shall be provided with a programmable logic controller installed within the VFD enclosure.
2. The programmable logic controller can be integral to the VFD control system or provided as a standalone controller installed within the VFD enclosure and wired to control the VFD.
3. The programmable logic controller shall include a comprehensive instruction set including: relay contact inputs, relay coil outputs, timers, counters, arithmetic functions, logical expressions, and PID loops.

4. The programmable logic controller shall be equipped with the required inputs and outputs to implement the control scheme indicated on the contract drawings.
5. The programmable logic controller shall be programmed to implement the control scheme described on the contract drawings.
6. All digital inputs and outputs shall be rated for 120 Vac and all analog inputs and outputs shall be 4-20mA, unless indicated otherwise.
7. The programmable logic controller shall be equipped with communication port capable of communicating the same protocol as specified for the VFD. The establishment and connection of the network shall be made and tested at the factory. A single communication port shall be available for connection of the programmable logic controller and VFD communication port to the plant communication network.
8. The programmable logic controller shall be programmed using ladder logic software.
9. Provide one licensed copy of the programming software.

E. Communication and Protocols:
1. The VFD shall be capable of direct communication to a standard x86 computer for serial link setup of parameters, fault diagnostics, trending and diagnostic log downloading.
2. The VFD shall be provided with an Ethernet communication card capable of communicating on a Ethernet/IP network.
   a. All control functions including start/stop and speed control shall be available via the network.
   b. All status and monitored input points shall be available via the network.
3. Provide a complete list of available control and indication points including required documentation for network configuration.

2.08 COMPONENT REQUIREMENTS:

A. Printed Circuit Boards: All printed circuit boards shall be new. They shall be conformably coated for moisture and chemical resistance, in addition to any dielectric coating properties. All boards shall be tested as specified.

B. Wiring:
1. All control wiring shall be physically separated from the power wiring. The VFD system shall be pre-wired within the enclosure. Spade-type connectors are not acceptable. No soldering shall be used in connection with any wiring. Wiring shall be adequately supported to avoid tension on conductors and terminations. All wiring shall be run in surface mounted conduit or wire-ways. Any section of wiring outside of conduit or wire-way shall be securely tied with cable ties or hook-and-loop (Velcro type) straps at intervals not exceeding 6 inches. No cables shall be tied off to or in any way supported from power busses. Wherever wiring passes metal edges or through holes, suitable guards or grommets shall be provided to prevent cutting or chafing of the insulation.
2. All terminal blocks shall have at least 20% spares. No more than two wires shall be terminated on one terminal.
3. All wiring shall be tagged with permanent labels at each termination, junction box, and device. Labels shall correspond to the schematic and wiring diagrams.

C. Ground Connection: Corrosion resistant grounding pads or terminals shall be provided in each power cubicle. A copper ground bus shall be provided for grounding of control circuits.

D. Input Power Terminations: Input and output power connections shall be made to isolated, supported and plated bus strap connections or terminal blocks. Sufficient space shall be provided for termination connections from the top or the bottom of the VFD cubicle.

E. Control Power:

1. A suitable sized 480 volt to 120 volt single phase control power transformer shall be provided to power all cooling fans and auxiliary devices. Additional capacity shall be provided for control devices powered from the VFD as indicated.
2. Control power for 24Vdc digital inputs shall be provided.
3. Shall be provided with ability to power VFD logic and communication boards from an external 120Vac Uninterruptible Power Supply (UPS) power source. The external power source shall allow the VFD to be programmed and configured without 480Vac power being supplied to the VFD, and allow communication and logic to maintain operation in the event of 480Vac power loss as long as the external power source is maintained. Provide the necessary field terminal blocks and 24Vdc power supply as required for this purpose.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment.
B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing VFDs and shall be maintained for the remainder of the construction period.

3.02 INSTALLATION:

A. Install to conform to manufacturer's instruction
B. Completely install as specified, indicated, or required for operation and continuous service at the locations indicated.
C. Wall mounted units shall be mounted approximately 4 feet to the centerline above the floor unless indicated otherwise.
D. Provide all openings in floors, walls, roofs, and other structures necessary for complete equipment installation, unless such openings are specifically indicated as being provided by others.
E. Place Dow Corning 3-6548 Silicone RTV or General Electric RTF762 sealant in the following locations:
   1. All holes in concrete walls, floors and roof slabs after installation of conduit.
   2. All unused holes and sleeves as approved by Resident Project Representative.
F. Level, shim, and anchor to floor or wall with bolts or concrete anchors, and grout all floor-mounted equipment.
G. Install all necessary wiring or interconnections as required.
H. Make all internal and external connections as indicated and as required by manufacturer's wiring diagrams.
I. Check all internal and external connections and tighten as required.
J. For freestanding enclosures install a 4-inch high concrete equipment (housekeeping) pad 4-inches wider and 4-inches deeper than the VFD.

3.03 FIELD QUALITY CONTROL:

A. Manufacturer’s Field Services:
   1. Manufacturer's field service shall be provided as specified in this Section and in Division 01.
   2. VFD system manufacturer shall provide the field services of a factory technician for a minimum of 3 day(s) on 3 separate occasions to supervise/inspect installation, test and start-up all equipment provided. All travel and living expenses shall be included. All

equipment required for testing, start-up and performance verification shall be provided by the start-up technician.

3. Assist the installing Contractor in the setup and configuration of the communications network.

B. Field Testing:

1. Perform "start-up" tests as recommended by manufacturer.
2. Establish proper direction of rotation for the motor controlled by the VFD.
3. Verify that the VFD operates properly in the "manual" control mode and in the "automatic" or "remote" control mode.
4. Verify that the VFD's speed adjusts properly with local speed controls and "automatic" or "remote" speed signals.
5. Set the maximum "locked rotor" current draw as recommended by the manufacturer and approved by the Engineer.
6. Set the minimum and maximum speed set points and the acceleration and deceleration ramp times as indicated or recommended by the Engineer.
7. Operate the VFD at 100% speed for at least 10 minutes and monitor output current. The output current should remain below the full load current listed on the motor nameplate. Check for excessive heating of the VFD and motor. Report any discrepancies to Engineer.
8. Verification of VFD input harmonic voltage and current distortion limits specified shall be verified at rated speed and rated power as part of final startup and acceptance of each VFD installation. A recording type Fluke, Multilin PQM, BMI or equivalent harmonic analyzer displaying individual and total harmonic currents and voltages shall be utilized.
9. Compliance with harmonic distortion limits shall be verified with field measurements at the point of common coupling (PCC) for each VFD. Measurements shall be made with all VFDs (or all VFDs that can be operated simultaneously) which are connected to the PCC in operation, and the measurements repeated without the VFDs in operation. Any distortions present when the VFDs are not in operation shall be subtracted from the readings when the VFDs are in operation. Test report shall be prepared and submitted as indicated below.
    a. Harmonic-Analysis Studies:
        (1) Scope of Study: Determine the impact of nonlinear loads and their associated harmonic contributions on the voltage and currents throughout the electrical system. Provide an analysis of all possible operating scenarios which will be or have been influences by the proposed or completed additions or changes to the subject system.
        (2) Procedure: The harmonic-analysis study shall be performed in accordance with the recommended practices and procedures set forth in IEEE 399.
        (3) Study Report: Results of the harmonic-analysis study shall be summarized in a final report containing the following items:
            (a) Basis, description, purpose, and scope of the study.
            (b) Tabulations of the data used to model the system components and corresponding one-line diagram.
            (c) Descriptions of the scenarios evaluated and the basis for each.
            (d) Tabulations of rms voltages, rms currents, and total capacitor bank loading versus associated equipment ratings. Equipment with insufficient ratings shall be clearly identified for each of the scenarios evaluated.

(e) Tabulations of calculated voltage-distortion factors, current-distortion factors, and individual harmonics versus the limits specified by IEEE 519. Calculated values exceeding the limits specified in the standard shall be clearly noted.
(f) Plots of impedance versus frequency showing resonant frequencies to be avoided.
(g) Tabulations of the system transformer capabilities based on the calculated nonsinusoidal load current and the procedures set forth in IEEE C57.110. Overloaded transformers shall be clearly noted.
(h) Conclusions and recommendations.

10. Test network communication and verify that VFD is responding to commands and reporting statuses properly to the PLC control system.
11. Test the operation of the programmable logic controller and verify that operation conforms to the description on the contract drawings.

3.04 FINISHES:

A. Equipment coatings shall be free from scratches, rust, or other defects.
B. All damaged or defective coatings shall be repaired prior to final acceptance.
C. Field Painting:
1. Touch Up:
a. Contractor shall prepare surfaces and touch up manufacturer applied coatings as required for any damage during shipment and installation.
b. Field painting shall be performed based on manufacturer's recommended procedures.
c. VFD manufacturer shall furnish Contractor with an adequate quantity of touch-up paint to match the factory applied finish.

3.05 ADJUSTING AND CLEANING:

A. After field installation and final wiring terminations are completed the field connected power and control wiring and cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.
B. Prior to final acceptance VFD interior and exterior shall be wiped clean and free from dust and debris.

3.06 TRAINING:

A. The VFD system supplier shall provide a minimum of one day of training at the customer's facility for operations, maintenance and service personnel.
1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, software mapping, programming, setup, configuration, control loop tuning, operational indicators, faults, diagnostic tools, troubleshooting, and preventive maintenance.
3. Hands-on training shall be provided on equipment.
4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.
B. Contractor shall record the training sessions and provide a final edited version to the Owner on a video DVD-ROM and electronic video file format (MPEG-4 AVC/H.264 or equivalent).

END OF SECTION 26 29 23

SECTION 26 33 53 – STATIC UNINTERRUPTIBLE POWER SUPPLY

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies Uninterruptible Power Supply (UPS) systems and associated accessories.

B. Provide UPS units and accessories as specified and indicated.

1.03 RELATED REQUIREMENTS:

A. Section 40 62 00 – Computer System Hardware and Ancillaries.

B. Section 40 66 00 – Process Control Networks.

C. Section 40 67 00 – Process Control Panels and Hardware.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.

B. The seller shall furnish Equipment which conforms in all respects to applicable industry standards and sound engineering practice.

C. Design, fabricate, assemble, install and test Equipment to conform to the applicable standards specified herein.

D. National Fire Protection Association (NFPA):

1. NFPA 70 – National Electrical Code.

E. Institute of Electrical and Electronics Engineers (IEEE):

1. IEEE C62.41 – Surge Voltages in Low-Voltage AC Power Circuits.
2. IEEE C62.41.1 – Surge Environment in Low-Voltage (1000 Volts and less) AC Power Circuits.
3. IEEE C62.41.2 – Characterization of Surges in Low-Voltage (1000 Volts and less) AC Power Circuits.
4. IEEE 519 – Harmonic Control in Electric Power Systems.
5. IEEE 944 – Recommended Practice for the Application and Testing of Uninterruptible Power Supplies for Power Generating Stations.

F. Code of Federal Regulations (CFR), Federal Communications Commission (FCC):

1. 47 CFR - FCC Part 15, Subpart J, Class A.

G. Underwriters Laboratories (UL).

1. UL 1449 – Surge Protective Devices.
2. UL 1778 – Uninterruptible Power Supply Equipment.

1.05 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.

B. Product Data: Submit for each type of product specified and include the following as minimum:

1. Device list and bills of material.
2. Data sheets for all hardware and software.

C. Shop Drawings: Provide the following as minimum:

1. Wiring Diagrams.

2. Battery runtime calculations.

D. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Information listed above.
   2. Commissioning test reports.
   3. Operation and maintenance manuals.

E. Maintenance Material Submittals:
   1. Software:
      a. Original CD/DVD-ROM disks and/or flash drives containing all software provided with supplied equipment. Associated licenses and license documentation shall be included.
      b. Organize and submit in a 3-ring binder.

F. Seismic Qualification Certificates: Submit certification that switchboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Section 26 05 48 – Vibration and Seismic Controls for Electrical Systems.

1.06 QUALITY ASSURANCE:

A. All Equipment and Material furnished shall have an acceptable history of satisfactory reliable service in similar use for a period of at least two years.

B. Equivalent newly developed Equipment with less than two years actual service will be considered from established manufacturers if it has been adequately tested, meets the requirements of this Contract, and is approved by Engineer. Such Equipment shall be noted in the proposal for review.

C. Factory Tests:
   1. Perform factory tests on complete system to verify proper operation before delivery to jobsite.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. UPS equipment and accessories shall be packaged and shipped to the project site to avoid damage.

B. All equipment shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants. Store at secured and insured warehouse location.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install UPS equipment specified herein until designated installation spaces are enclosed, weather tight, and free of contaminants.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to installation and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. UPS units shall be provided with a minimum 5-year manufacturer's warranty.

B. All other peripherals shall be provided with a minimum 5-year warranty period.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Uninterruptible Power System (UPS):
   1. Liebert, Emerson Electric Company.

2. Mitsubishi.
3. Powerware.

2.02 SCALABLE, DOUBLE CONVERSION UPS:

A. Scalable, network grade, on-line double conversion, uninterruptible power system rated 12 kVA with continuous line conditioning, inverter, batteries and control system.
B. N+1 redundancy with one more power module than is required to support rated load.
C. Field replaceable, hot swappable power and battery modules.
D. Redundant and hot swappable control modules.
E. Internal bypass.
F. Tower unit with minimum chassis capacity to support full unit rating and provide minimum runtime specified.
G. Electrical Capacity: Provide scalable unit with installed capacity and full unit rating as indicated. Scalable increments shall be a maximum of 4kVA.
H. Provide a unit that will produce its full rated output continuously.
I. The unit shall utilize double conversion technology to continuously clean the power in either normal or emergency mode to protect against spikes, sags, surges, noise, lightning, and brownouts.
J. Input Voltage: 120/208-volt, 60 hertz, single phase (3-wire with ground).
K. Output Voltage: 120/208-volt, 60 hertz, single phase (3-wire with ground).
L. The unit shall automatically switch to battery inverter backup upon loss of power and retransfer on return of normal power. These transfers shall have no effect on the output waveform and shall be transparent to the connected load.
M. The output waveform will be 60 hertz ±0.5-hertz sine wave with less than 5% total harmonic distortion (THD).
N. Shall conform to IEEE 519.
O. Surge withstand shall exceed C62.41.1 and C62.41.2.
P. Noise rejection - common mode better than 120 dB; transverse mode greater than 60 dB.
Q. Output shall have an isolated neutral.
R. Electromagnetic interference shall be minimized to ensure that computer systems shall neither effect nor be affected by the UPS. RFI filtering shall be provided on the input and output to minimize high frequency noise interference.
S. The batteries shall be sealed maintenance-free type NiCAD batteries.
T. The battery charger shall be fully automatic capable of recharging the batteries within 3 hours.
U. The unit shall automatically disconnect from the batteries and shutdown, preventing damage to the batteries due to a deep discharge.
V. The battery capacity shall be such to be able to sustain a power outage of 60 minutes at 100% rated wattage output, and to maintain 50% of rated wattage output for a period of 120 minutes.
W. Ambient Environment: 0°C to 40°C.
X. Provide with an LCD operator interface. Status indicators and audible alarm shall indicate normal, transfer to inverter, battery charging and overload, or failure alarm.
Y. Provide with UPS management card supporting Ethernet network interface to allow communication with the plant control system via SNMP (simple network management protocol). The network interface card shall also provide a web interface for monitoring and management of the UPS utilizing standard web browser software.
Z. Connections:
   1. Input: Hardwired.
   2. Output: Hardwired.
AA. Maintenance Bypass Switch:

1. Provide a rack mounted, make-before-break maintenance bypass switch rated for the full frame capacity output of the supplied UPS. Minimum size as indicated.

PART 3 - -EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment. The area for installation shall be fully enclosed, weather tight, and free of contaminants.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to installation and shall be maintained for the remainder of the construction period.

3.02 INSTALLATION:

A. Install the UPS system and associated accessories as indicated.

B. Provide the required access for maintenance of the equipment.

C. The UPS system shall be put in operation per the manufacturer's recommendations.

3.03 FIELD QUALITY CONTROL:

A. Manufacturer’s Field Services:

1. Manufacturer's field service shall be provided as specified in this Section and in Division 01.
2. The manufacturer shall provide the field services of a factory technician for a minimum of 3 days to supervise/inspect installation, test and start-up all equipment provided. All travel and living expenses shall be included. All equipment required for testing, start-up and performance verification shall be provided by the start-up technician.
3. Replacement parts shall be available 24 hours a day, 7 days a week, so the parts may be delivered to the customer site within 24 hours.
4. Assist the installing Contractor in the setup and configuration of the network card and associated communications.

B. Field Testing:

1. Prior to energization check all accessible connections to manufacturer's torque tightening specifications.
2. Prior to energization, check for short-circuits.
3. Perform “start-up” tests as recommended by manufacturer.
4. Verify proper operation of alarm and status signals.

3.04 ADJUSTING AND CLEANING:

A. Prior to final acceptance all UPS units and associated equipment shall be wiped clean and free from dust.

B. If equipment interiors have been exposed to dust and other contaminates the Contractor shall provide the necessary interior cleaning of equipment. Use precaution and proper cleaning methods to avoid damage of equipment.

3.05 TRAINING:

A. The training session shall be of sufficient content and duration to provide a basic understanding of the hardware/software in general and specific instruction on the Site-specific implementation.

B. The UPS system supplier shall provide a minimum of 8 hours of training at the customer's facility for operations, maintenance and service personnel.

1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the equipment.
2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, faults, diagnostic tools, troubleshooting, and preventive maintenance.
3. Hands-on training shall be provided on equipment.
4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.
5. The training session shall be coordinated with Owner and Engineer.

C. Contractor shall record the training sessions and provide a final edited version to the Owner on a DVD-ROM and electronic video file format.

END OF SECTION 26 33 53

SECTION 26 43 13 – SURGE PROTECTIVE DEVICES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes parallel and series-wired, surge protective devices (SPDs) for service entrance and AC distribution equipment not exceeding 1000V, including disconnects, switchboards, motor control centers, panelboards, and point-of-service equipment (power for control panels).

1.03 RELATED REQUIREMENTS:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
B. Section 26 24 13 – Switchboards.
C. Section 26 24 16 – Panelboards.
D. Section 26 24 19 – Motor Control Centers.
E. Section 40 66 00 – Process Control Networks: For antenna surge protective devices.
F. Section 40 67 00 – Process Control Panels and Hardware: For control panel Type 2 and Type 4 surge protective devices that protect data and signal lines, CATV/CCTV, and other hard-wired communication devices within a control panel.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
B. National Fire Protection Association (NFPA):
    1. NFPA 70 – National Electrical Code (NEC)
        a. Article 285 – Surge-Protective Devices (SPDs) 1 kV or Less.
    2. NFPA 780 – Standards for the Installation of Lightning Protection Systems.
C. National Electrical Manufacturers Association (NEMA). Comply with applicable requirements of the following standards:
    1. NEMA 250 – Enclosures for Electrical Equipment (1,000V maximum).
D. Underwriters Laboratories (UL). Comply with applicable requirements of the following standards:
    1. UL 1283 – Electromagnetic Interference Filters.
    2. UL 1449 – Surge Protective Devices.
E. Institute of Electrical and Electronic Engineers (IEEE) comply with applicable requirements of the following standard.
    1. IEEE C62.33 – Test Specifications for Metal-Oxide Varistor Surge Protective Components.
    2. IEEE C62.41.1 – Surge Environment in Low-Voltage (1000V and less) AC Power Circuits.
    3. IEEE C62.41.2 – Characterization of Surges in Low-Voltage (1000V and less) AC Power Circuits.
    4. IEEE C62.45 – Surge Testing for Equipment Connected to Low Voltage (1000V and less) AC Power Circuits.

5. IEEE C62.62 – Test Specifications for Surge-Protective Devices (SPDs) for Use on the Load Side of the Service Equipment in Low Voltage (1000 V and less) AC Power Circuits.
6. IEEE 1100 (Emerald Book) – Recommended Practice for Powering and Grounding Electronic Equipment.

1.05 DEFINITIONS AND ABBREVIATIONS:

A. I-n: I-nominal rating.
B. MCOV: Maximum Continuous Operating Voltage rating.
C. MOV: Metal Oxide Varistors.
D. SAD: Silicon Avalanche Diodes.
E. SCCR: Short Circuit Current Rating.
F. SPD: Surge Protection Device.
G. VPR: Voltage Protection Rating.
H. Type 1 SPDs – Permanently connected SPDs intended for installation between the secondary of the service transformer and the line side of the service equipment overcurrent device, as well as the load side, including watt-hour meter socket enclosures and intended to be installed without an external overcurrent protective device.
I. Type 2 SPDs – Permanently connected SPDs intended for installation on the load side of the service equipment overcurrent device; including SPDs located at the branch panel.
J. Type 3 SPDs – Point of utilization SPDs, installed at a minimum conductor length of 10 meters (30 feet) from the electrical service panel to the point of utilization, for example cord connected, direct plug-in, receptacle type and SPDs installed at the utilization equipment being protected.

1.06 SUBMITTALS:

A. Submit as specified in Division 01 and Section 26 05 10 – General Electrical Requirements for administrative and procedural requirements for submittals.
B. Product Data – Submit for each type of product specified, including the following as a minimum:
    1. Data sheets:
        a. Physical details and dimensions.
        b. Power input voltage and frequency.
        c. Type category.
        d. UL 1449 Listing documentation verifying the following:
            (1) Short Circuit Current Rating (SCCR).
            (2) Voltage Protection Ratings (VPRs) for all modes.
            (3) Maximum Continuous Operating Voltage rate (MCOV) for Type 1 and Type 2 SPDs.
            (4) I-nominal rating (I-n) for Type 1 and Type 2 SPDs.
            (5) Device type designation.
        e. Peak surge current rating per phase.
C. Shop Drawings: For externally-mounted units, provide shop drawings including manufacturer's installation requirements, field connections and manufacturer's recommended wire and breaker sizes.
D. Closeout Submittals – Final documentation shall include the following as a minimum:
    1. Operation and Maintenance Manuals including the following:
        a. Operation and maintenance manuals for each type of SPD.
        b. Copies of all approved Product Data.

c. Copies of all approved Shop Drawings.
d. Warranty information.

1.07 QUALITY ASSURANCE:
A. Installer Qualifications:
B. Testing Agency Qualifications:

1.08 SOURCE QUALITY CONTROL:
A. Tests, inspections: At the shop, factory, plant, or place of manufacture.
B. Verification of performance: Compliance with specified criteria.

1.09 DELIVERY, STORAGE, AND HANDLING:
A. Integral SPDs shall be delivered, pre-installed, and stored according to the requirements of the distribution equipment or control panel in which they are installed. Store at secured and insured warehouse location.

1.10 PROJECT SITE CONDITIONS:
A. Do not deliver or install SPDs or equipment in which they are installed until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above installation area is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.11 WARRANTY:
A. SPD manufacturer shall provide free replacement of the entire model with a minimum warranty period of 10 years from date of shipment. This warranty shall be limited only by failure to comply with manufacturer's installation instructions and applicable national or local code and may not exclude lightning or temporary overvoltage.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:
A. A manufacturer's presence on this list does not guarantee that all of its models are acceptable. The Contractor is responsible for insuring that each SPD model meets all requirements of this specification.
1. Eaton.
2. General Electric.
3. Libert.

2.02 GENERAL REQUIREMENTS FOR SURGE PROTECTIVE DEVICES:
A. UL 1449 4th Edition listed and labeled.
B. Shall be UL labeled as a Type 1 or Type 2 device, shall be intended to be installed on the load side of the service entrance equipment and shall not require external or supplemental overcurrent safety controls to meet UL 1449 4th Edition.
C. The surge protective device (SPD) shall be of a modular design using fast-acting transient energy protection that will divert and dissipate the surge energy.
D. Shall provide independent, directly-connected suppression components on each mode in the electrical distribution system, at least seven modes in Wye systems (L-N, L-G, N-G) and six modes (L-L, L-G) in Delta and impedance grounded Wye systems.

E. Shall be an internally-mounted device as specified or indicated.
F. Shall use metal oxide varistor or MOV-hybrid technology as necessary. Spark gaps, selenium cells and SCRs shall not be acceptable.
G. Shall include internal fuses and thermally protection over every suppression component of every mode, including N-G unless protecting the service entrance.
H. Shall have integral, panel front status monitors or remote status panel ability as a minimum to indicate a continuous positive status of all protected modes, including N-G mode where applicable. Diagnostics shall be electrically isolated to prevent damage by surges.
I. Shall be UL labeled with a short circuit current rating of 200kA.
J. The maximum continuous operating voltage at 60 Hz shall be capable of sustaining at least 115% of the peak voltages continuously without degrading.
K. The maximum UL 1449 Third Edition Voltage Protection Ratings (VPR) for the device must not exceed the following:

Service	L-N	L-G	N-G	L-L	MCOV
120V 2-wire + Gnd	600V	1000V	600V	NA	150
120/240Vac 3-Wire + Gnd	700V	700V	700V	1200V	150
208/120Vac 3-phase, 3 or 4-wire	700V	700V	700V	1200V	150/276
480 Vac 3-phase, 3 Wire Delta	NA	1800V	NA	1800V	550
480/277 Vac 3-phase, 3-wire or 4-wire	1200V	1200V	1200V	2000V	550/320

L. Type 1 and Type 2 SPDs shall be UL labeled with 20kA I-n for compliance to UL 96A Lightning Protection Master Label and NFPA 780.

2.03 SERVICE ENTRANCE SURGE PROTECTIVE DEVICE:

A. The SPD shall be suitable for 480/277V, 3-phase, 4-wire 60 Hz, service-entrance equipment and be integrally mounted.
B. Service entrance units shall be tested and demonstrated suitable for application within ANSI/IEEE C62.41 Category C environments.
C. Shall have a peak surge current of 240 kA per phase.

2.04 SURGE PROTECTIVE DEVICE FOR MOTOR CONTROL CENTERS, DISTRIBUTION PANELBOARDS AND POINT OF SERVICE EQUIPMENT:

A. The SPD shall be suitable for 480/277V, 120/240V, 208/120V, 120V, 1-phase,3-phase, 3-wire, 4-wire 60Hz and be integrally mounted.
B. Downstream SPD units shall be tested and demonstrated suitable for application with ANSI/IEEE C62.41 Category B environments.
C. Shall have a peak surge current of 160 kA per phase.
D. Internally-mounted units shall have an enclosure designed for mounting within a motor control center, control panel, or panelboard.
E. Shall include EMI/RFI filtering for ring wave suppression.
F. Shall have a minimum EMI/RFI filtering of -30dB at 100 kHz.
G. UL 1283 Listed (Latest Edition).

2.05 ADDITIONAL REQUIREMENTS FOR SPDS INTEGRAL TO THE POWER DISTRIBUTION EQUIPMENT:

A. The SPD shall be mounted to the equipment by a direct bus bar connection.
B. The SPD shall not limit the use of through-feed lugs, sub-feed lugs, or sub-feed breaker options.
C. The power distribution equipment shall be capable of re-energizing upon removal of the SPD.

2.06 ACCESSORIES:

A. Monitoring Diagnostics/Accessories:
   1. Protection Status Indicators - Each unit shall have a green/red solid-state indicator light that reports the status of the protection element on each phase.
      a. Wye configured units, shall have indication in the L-N and L-G and N-G modes.
      b. Delta configured units, shall have status indication in the L-G and L-L modes.
      c. The absence of a green light and the presence of a red light shall indicate that damage has occurred on the respective phase or mode. All protection status indicators must indicate the actual status of the protection on each phase or mode. If power is removed from any one phase, the indicator lights must continue to indicate the status of the protection on all other phases and protection modes. Diagnostics packages that simply indicate whether power is present on a particular phase shall not be accepted.
   2. Remote Status Monitor: The SPD must include Form C dry contacts (one NO and one NC) for remote annunciation of its status. Both the NO and NC contacts shall change state under any fault condition.
   3. Audible Alarm and Silence Button: The SPD shall contain an audible alarm that will be activated under any fault condition. There shall also be an audible alarm silence button used to silence the audible alarm after it has been activated.
   4. Surge Event Counter: The SPD shall be equipped with an LCD display that indicates to the user how many surges have occurred at the location.
      a. The surge counter shall trigger each time a surge event with a peak current magnitude of a minimum of 50 ± 20A occurs. A reset pushbutton shall also be standard, allowing the surge counter to be zeroed. The reset button shall contain a mechanism to prevent accidental resetting of the counter via a single, short-duration button press. To prevent accidental resetting, the surge counter reset button shall be depressed for a minimum of 2 seconds in order to clear the surge count total.
      b. The ongoing surge count shall be stored in non-volatile memory. If power to the SPD is completely interrupted, the ongoing count indicated on the surge counter's display prior to the interruption shall be stored in non-volatile memory and displayed after power is restored. The surge counter's memory shall not require a backup battery to achieve this functionality.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine area and location of equipment to receive SPDs for compliance with manufacturer's environmental conditions and other conditions affecting performance of the Work.
B. Examine field installed SPDs before installation. Reject SPDs that have been wet, moisture damaged, or physically damaged.
C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 GENERAL INSTALLATION REQUIREMENTS:

A. The installation of the surge suppression system shall be installed in strict accordance with the manufacturer's recommended practices and in compliance with the NEC.
B. The Contractor shall verify the proper application of the SPD (i.e. voltage, phases, etc.)
C. The Contractor shall verify that all neutral conductors are bonded to the system ground at the service entrance or at the serving transformer prior to installation of the SPD.
D. The phase, neutral and grounding conductors serving the SPD shall be gently twisted to reduce the SPD system inductance and shall be kept at the minimum length. Avoid any sharp bends and coils in the conductors.
E. Do not perform insulation resistance tests on a piece of electrical equipment with an SPD installed. SPDs are not designed to withstand the relatively high voltages applied for the duration of a megger test measured in seconds. Disconnect the SPD during insulation testing and reconnect immediately after testing is over.

3.03 INSTALLATION OF INTERNALLY-MOUNTED SPDS:

A. When installed within a switchboard, motor control center, or panelboard, the SPD shall be installed in a dedicated bucket or space.
B. When installed within a control panel, the SPD shall be provided and installed by the control panel fabricator. Refer to Section 40 67 00 – Process Control Panels and Hardware.
C. Provide a disconnecting means or overcurrent protection and wiring as recommended by the manufacturer. When no recommendation is provided install the SPD through a 30-Amp circuit breaker using 10-gauge wire.

3.04 FIELD QUALITY CONTROL:

A. Perform tests and inspections: Inspect SPDs, modules, connections, and installation. Test and Inspect SPDs for proper function per manufacturers recommendations.

3.05 CLEANING:

A. Prior to final acceptance enclosure interior and exterior shall be wiped clean and free from dust and debris.

3.06 DEMONSTRATION:

A. Upon completion of installation of SPDs and associated electrical circuitry, energize circuitry and demonstrate functioning of equipment in accordance with manufacturer’s requirements. Where possible, correct any malfunctioning units at the project site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and retest to demonstrate compliance.

3.07 TRAINING:

A. Provide a minimum of 1 hour of training for each type of SPD provided at the customer's facility for operations, maintenance and service personnel.
    1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
    2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, faults, diagnostic tools, troubleshooting, and preventive maintenance.
    3. Hands-on training shall be provided on equipment. Specific training shall demonstrate the replacement procedures for SPD modules.

4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.

B. Contractor shall record the training sessions and provide a final edited version to the Owner on a video DVD-ROM and electronic video file format.

END OF SECTION 26 43 13

SECTION 26 50 00 – LIGHTING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes the following:
   1. Interior Luminaires:
      a. Light-emitting Diode (LED) type.
   2. Exterior luminaires.
      a. Light-emitting diode (LED) type.
   3. Emergency lighting units.
   4. Exit signs.
   5. Ballasts and drivers.
   6. Emergency ballasts and drivers
   7. Lamps.
   8. Luminaire accessories.
   9. Poles and accessories.

1.03 RELATED REQUIREMENTS:

A. Section 03 30 00 – Cast-in-Place Concrete: Materials and installation requirements for concrete bases for poles.
B. Section 26 05 10 – General Electrical Requirements.
C. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
D. Section 26 05 33 – Raceways, Boxes, Seals, and Fittings for Electrical Systems.
E. Section 26 05 53 – Identification for Electrical Requirements.
F. Section 26 27 26 – Wiring Devices.
G. Section 26 09 23 – Lighting Control Equipment

1.04 REFERENCE STANDARDS:

A. American Association of State Highway and Transportation Officials (AASHTO):
   1. AASHTO LTS – Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals; American Association of State Highway and Transportation Officials; 5th Edition, with 2011 Interim Revisions.
B. American National Standards Institute (ANSI)/Institute of Electrical and Electronic Engineers (IEEE):
   1. ANSI/IEEE C62.41.2 – Recommended Practice on Characterization of Surges in Low-Voltage (1000V and less) AC Power Circuits; 2002 (Cor 1, 2012).
   2. ANSI/IEEE C136.10 – American National Standard for Roadway and Area Lighting Equipment - Locking-Type Photocontrol Devices and Mating Receptacles - Physical and Electrical Interchangeability and Testing; 2010.
C. Illuminating Engineering Society of North America (IESNA):
   1. IESNA LM-63 – ANSI Approved Standard File Format for Electronic Transfer of Photometric Data and Related Information; 2002 (Reaffirmed 2008).
   2. IESNA LM-64 – Photometric Measurements of Parking Areas; 2001 (Reaffirmed 2007).
   3. IESNA LM-79 – Electrical and Photometric Measurements of Solid-State Lighting; Latest Edition.

4. IESNA RP-8 – American National Standard Practice for Roadway Lighting; Illuminating Engineering Society of North America; 2000 (R2005) (ANSI/IES RP8).
5. LM-80 – IES Approved Method: Measuring Lumen Maintenance of LED Light Sources.
6. TM-21 – Projecting Long Term Lumen Maintenance of LED Light Sources.

D. National Electrical Contractors Association (NECA):
1. NECA 1 – Standard for Good Workmanship in Electrical Construction; National Electrical Contractors Association; 2010.
2. NECA/IESNA 500 –Standard for Installing Indoor Commercial Lighting Systems; National Electrical Contractors Association; 2006.
3. NECA/IESNA 501 – Recommended Practice for Installing Exterior Lighting Systems; 2006.
4. NECA/IESNA 502 – Standard for Installing Industrial Lighting Systems; National Electrical Contractors Association; 2006.

E. National Electrical Manufacturers Association (NEMA):
1. NEMA 410 – Performance Testing for Lighting Controls and Switching Devices with Electronic Drivers and Discharge Ballasts; National Electrical Manufacturers Association; 2011.
2. NEMA LE 4 – Recessed Luminaires, Ceiling Compatibility; National Electrical Manufacturers Association; 2012.

F. National Fire Protection Associations (NFPA):
1. NFPA 70 – National Electrical Code; National Fire Protection Association; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.
2. NFPA 101 – Life Safety Code; National Fire Protection Association; 2012.

G. Underwriters Laboratories (UL):
1. UL 844 –Luminaires for Use in Hazardous (Classified) Locations; Current Edition, Including All Revisions.
2. UL 924 – Emergency Lighting and Power Equipment; Current Edition, Including All Revisions.
3. UL 1598 – Luminaires; Current Edition, Including All Revisions.
4. UL 8750 – Light Emitting Diode (LED) Equipment for Use in Lighting Products; Current Edition, Including All Revisions.

1.05 ADMINISTRATIVE REQUIREMENTS:

A. Coordination:
1. Coordinate the installation of luminaires with mounting surfaces installed under other sections or by others. Coordinate the Work with placement of supports, anchors, etc. required for mounting. Coordinate compatibility of luminaires and associated trims with mounting surfaces at installed locations.
2. Coordinate the placement of luminaires with structural members, ductwork, piping, equipment, diffusers, fire suppression system components, and other potential conflicts installed under other sections or by others.
3. Coordinate the placement of exit signs with furniture, equipment, signage or other potential obstructions to visibility installed under other sections or by others.
4. Coordinate placement of poles and associated foundations with utilities, curbs, sidewalks, trees, walls, fences, striping, etc., installed under other Sections or by others. Coordinate elevation to obtain specified foundation height.
5. Notify Engineer of any conflicts or deviations from the contract documents to obtain direction prior to proceeding with work.

1.06 SUBMITTALS:

A. Refer to Division 1 – Submittals and Section 26 05 10 – General Electrical Requirements, for administrative and procedural requirements for submittals.

B. Shop Drawings:
   1. Indicate dimensions and components for each luminaire that is not a standard product of the manufacturer.
   2. Provide photometric calculations where luminaires are proposed for substitution upon request.

C. Product Data: Provide manufacturer's standard catalog pages and data sheets including detailed information on luminaire construction, dimensions, ratings, finishes, mounting requirements, listings, service conditions, photometric performance, installed accessories, and ceiling compatibility; include model number nomenclature clearly marked with all proposed features. Arrange in order of luminaire designation.
   1. Lamps: Include rated life, color temperature, color rendering index (CRI), initial and mean lumen output, and energy efficiency data.
   2. Emergency Ballasts and Drivers: Include list of compatible lamp configurations associated lumen output, and battery and charger data.
   3. Emergency Lighting Units: Battery and charger data.
   4. Exit Signs: Battery and charger data.
   5. Poles: Include information on maximum supported effective projected area (EPA) and weight for the design wind speed, materials, dimensions, finishes, required anchor bolts, and manufactured pole foundations.
   6. Provide means of attaching luminaires to supports, and indication that attachment is suitable for components involved.

D. Certificates for Bi-level Ballasts, Dimming Ballasts and Dimming Drivers: Manufacturer's documentation of compatibility with dimming controls to be installed.

E. Certificates for Poles and Accessories: Manufacturer's documentation that products are suitable for the luminaires to be installed and comply with designated structural design criteria.

F. Wiring diagrams: Include diagrams for power, signal and control wiring. Differentiate between portions of wiring which are manufacturer factory-installed and portions which are field-installed.

G. Field Quality Control Reports.

H. Seismic Qualification Certificates: For luminaires, accessories, and components, from manufacturer.
   1. Basis of Certification: Indicate whether withstand certification is based on actual test of assembled or on calculations.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

I. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by product testing agency. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

J. Operation and Maintenance Data: Instructions for each product including information on replacement parts.
   1. Provide a list of all lamp types used on the Project; use ANSI and manufacturers' codes.

K. Maintenance Materials: Furnish the following for Owner's use in maintenance of Project.
   1. See Division 01 for additional Equipment and Materials provisions.

2. Extra Fuses: 5% of total quantity installed for each type, but not less than two of each type.
3. Extra LED drivers: 2% of total quantity installed for each type, but not less than one of each type.
4. Touch-Up Paint: one quart, to match color of pole finish.

1.07 QUALITY ASSURANCE:

A. Conform to requirements of NFPA 70.
B. Maintain at the Project Site a copy of each referenced document that prescribes execution requirements.
C. Provide luminaires from a single manufacturer for each luminaire type.
D. Manufacturer Qualifications: Company specializing in manufacturing the products specified in this Section.

1.08 DELIVERY, STORAGE, AND HANDLING:

A. Receive, handle, and store products according to NECA/IESNA 500 (commercial lighting), NECA/IESNA 501 (exterior lighting), NECA/IESNA 502 (industrial lighting), and manufacturer's written instructions. Store at secured and insured warehouse location.
B. Keep products in original manufacturer's packaging and protect from damage until ready for installation.

1.09 FIELD CONDITIONS:

A. Maintain field conditions within manufacturer's required service conditions during and after installation.

1.10 WARRANTY:

A. Interior Lighting:
   1. LED luminaires shall have a minimum 5-year manufacturer warranty.
   2. Provide five-year pro-rata warranty for batteries for emergency lighting units.
   3. Provide ten-year pro-rata warranty for batteries for self-powered exit signs.
   4. Provide three-year full warranty for emergency ballasts and drivers.
B. Exterior Lighting:
   1. Provide five-year manufacturer warranty for all exterior luminaires.
   2. Provide five-year manufacturer warranty for metal corrosion.
   3. Provide five-year manufacturer warranty for color retention.
C. Repair or replace all luminaires and lighting poles that fail in finish, materials, and workmanship within manufacturer's standard warranty period, but not less than two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Luminaires:
   1. Acuity Brands, Inc.
      a. American Electric Lighting.
      b. Holophane.
      c. Lithonia.
      d. Mark Architectural Lighting.
      e. Peerless.

2. Benjamin Division; Thomas Industries Inc.
3. Cooper Lighting, a division of Eaton.
4. CPM Lighting, Inc. (Columbia-Prescolite-Moldcast).
5. Day-Bright Lighting, Division of Emerson Electric Co.
6. Hubbell Lighting, Inc.
7. KIM Lighting, Inc.
8. Lutron Electronics Company, Inc.
9. HE Williams.
10. Philips Lighting.
11. Approved Equal.

B. Emergency Lighting Units and Exit Signs:
1. Acuity Brands, Inc.
2. Cooper Lighting, a division of Eaton.
3. Hubbell Lighting, Inc.
4. HE Williams.
5. Philips Lighting.
6. Approved Equal.

C. Drivers:
1. General Electric Company/GE Lighting.
2. Iota Engineering.
3. Lutron Electronics Company, Inc.
4. Osram Sylvania.
5. Philips Lighting Electronics/Advance.
6. Approved Equal.
7. Manufacturer Limitations: Where possible, for each type of luminaire provide drivers produced by a single manufacturer.

D. Emergency Drivers:
1. Iota Engineering, LLC.
2. Lithonia Lighting.
3. Philips Emergency Lighting/Bodine.
4. Approved Equal.
5. Manufacturer Limitations: Where possible, for each type of luminaire provide emergency drivers produced by a single manufacturer.

E. Lamps:
1. General Electric Company/GE Lighting.
2. Osram Sylvania.
3. Philips Lighting Company.
4. Approved Equal.
5. Manufacturer Limitations: Where possible, provide lamps produced by a single manufacturer.

F. Light Sensitive Control Devices:
1. Cooper - Crouse-Hinds, a division of Eaton.
2. Intermatic, Inc.
3. Fisher-Pierce, Sunrise Technologies of the Electro Switch Corporation.
4. Approved Equal.

G. Poles:
1. Acuity Brands, Inc.
2. Cooper Lighting, a division of Eaton.
3. Hubbell Lighting, Inc.

4. Valmont Industries, Inc.
5. GE Current
6. Approved Equal.
7. Manufacturer Limitations: Where possible, provide all poles produced by a single manufacturer.

2.02 LUMINAIRE TYPES:

A. Furnish products as indicated in the luminaire schedule included on the Contract Drawings.

2.03 LUMINAIRES:

A. Provide products that comply with requirements of NFPA 70.
B. Provide products that are listed and labeled as complying with UL 1598, where applicable.
C. Provide products listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.
D. Provide products complying with Federal Energy Management Program (FEMP) requirements.
E. Provide products with lamp base complying with ANSI C81.61.
F. Provide exterior lighting products complying with IESNA RP-8 for parameters of lateral light distribution patterns indicated for luminaires.
G. Unless otherwise indicated, provide complete luminaires including lamp(s) and all sockets, reflectors, lenses, housings and other components required to position, energize and protect the lamp and distribute the light.
H. Unless specifically indicated to be excluded, provide all required conduit, boxes, wiring, connectors, hardware, supports, trims, accessories, integral mounting provisions, etc., as necessary for a complete operating system.
I. Provide products suitable to withstand normal handling, installation, and service without any damage, distortion, corrosion, fading, discoloring, etc.
J. Interior Luminaire Materials:
    1. Metal Parts:
        a. Free of burrs and sharp corners and edges.
        b. Sheet metal components shall be steel unless otherwise indicated.
        c. Form and support to prevent warping and sagging.
    2. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
    3. Diffusers and Globes:
        a. Acrylic Diffusers: 100% virgin acrylic plastic, with high resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
        b. Glass: Annealed crystal glass unless otherwise indicated.
        c. Lens Thickness: At least 0.125 inch (3.175 mm) minimum unless otherwise indicated.
    4. Housings:
        a. Extruded-aluminum housing and heat sink.
        b. 5VA(fl) fiberglass housing and heatsink as indicated on the contract drawings.
        c. Painted finish after fabrication, finish as indicated in luminaire schedule.
    5. Conduit: Minimum 3/4 inch (21 mm) in diameter, type as specified.
    6. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Locate labels where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.

a. Label shall include the following lamp characteristics:
(1) "USE ONLY" and include specific lamp type.
(2) Lamp diameter, shape, size, wattage, and coating.
(3) ANSI ballast type (M98, M57, etc.) for HID luminaires.
(4) CCT and CRI for all luminaires.

7. Metal Finishes:
a. Variations in finishes are unacceptable in the same piece. Variations in finishes of adjoining components are acceptable if they are within the range of approved Samples, and if they can be and are assembled or installed to minimize contrast.

K. Exterior Luminaire Materials:
1. Metal Parts: Free of burrs and sharp corners and edges.
2. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.
3. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.
4. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
5. Exposed Hardware Material: Stainless steel.
6. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
7. Light Shields: Metal baffles, factory installed and field adjustable, arranged to block light distribution to indicated portion of normally illuminated area or field.
8. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:
a. White Surfaces: 85%.
b. Specular Surfaces: 83%.
c. Diffusing Specular Surfaces: 75%.
9. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
10. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.
11. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps and drivers as applicable. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
a. Label shall include the following lamp and ballast characteristics:
(1) "USES ONLY" and include specific lamp type.
(2) CCT and CRI for all luminaires.

L. Recessed Luminaires:
1. Ceiling Compatibility: Comply with NEMA LE 4.
2. Luminaires Recessed in Insulated Ceilings: Listed and labeled as IC-rated, suitable for direct contact with insulation and combustible materials.

M. Hazardous (Classified) Location Luminaires: Listed and labeled as complying with UL 844 for the classification of the installed location.

N. LED Luminaires:
1. General:

a. LED Luminaire Components: UL 8750 recognized or listed as applicable. Tested according to LM-79.
b. Luminaires shall be binned with a minimum of a three-step MacAdam Ellipse to ensure color consistency among luminaires.

2. LED Luminaires with Integral LEDs:
   a. Correlated Color Temperature (CCT):
      (1) Indoor: 3,500K (neutral) or 4000K as indicated on the drawings.
      (2) Outdoor: 4,000K unless otherwise indicated.
   b. Color Rendering Index (CRI): Not less than 80.
   c. Average Rated Life: Not less than 50,000 hours for an operating cycle of three hours per start.
   d. Lamps shall be dimmable from 100% to 5% of maximum light output where indicated.
   e. LED Assembly shall be mounted to die cast aluminum housing for thermal management.
   f. LED drivers shall have a power factor greater than 0.90 lagging and less than 20 percent total harmonic current distortion (THD).
   g. Operating temperature of LED assembly and fixture shall be rated for -30 to +40°C ambient.
   h. Fixture shall be UL listed for operation in damp locations when indicated.

2.04 EMERGENCY LIGHTING UNITS:

A. Description: Emergency lighting units complying with NFPA 101 and all applicable state and local codes, and listed and labeled as complying with UL 924.
B. Recessed Luminaires: Comply with NEMA LE 4.
C. Operation: Upon interruption of normal power source or brownout condition exceeding 20% voltage drop from nominal, solid-state control automatically switches connected lamps to integral battery power for minimum of 90 minutes of rated emergency illumination, and automatically recharges battery upon restoration of normal power source.
D. Battery:
   1. Size battery to supply all connected lamps, including emergency remote heads where indicated.
   2. Remote Mounted: Provide NEMA 250, Type 1 enclosure listed for installation inside, on top of, or remote from luminaire. Remote assembly shall be located no less than half the distance recommended by the manufacturer.
E. Diagnostics: Provide power status indicator light and accessible integral test switch to manually activate emergency operation.
F. Charger: Fully automatic, solid-state, constant-current type with sealed power transfer relay.
G. Provide low-voltage disconnect to prevent battery damage from deep discharge.
H. Self-Diagnostics: Provide units that self-monitor functionality and automatically perform testing required by NFPA 101 where indicated; provide indicator light(s) to report test and diagnostic status.
I. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
   1. Ambient Temperature: Less than 0ºF (-18ºC) or exceeding 104ºF (40ºC), with an average value exceeding 95ºF (35ºC) over a 24-hour period.
   2. Ambient Storage Temperature: Not less than -4ºF (-20ºC) and not exceeding 140ºF (60ºC).
   3. Humidity: More than 95% (condensing).

4. Altitude: Exceeding 3,300 feet (1000 m).

J. Accessories:
1. Provide compatible accessory mounting brackets where indicated or required to complete installation.
2. Provide compatible accessory high impact polycarbonate vandal shields where indicated.
3. Provide compatible accessory wire guards where indicated.
4. Where indicated, provide emergency remote heads that are compatible with the emergency lighting unit they are connected to and suitable for the installed location.
5. Provide compatible accessory remote combination test switch/indicator light where indicated.

2.05 EXIT SIGNS:

A. Description: Exit signs and similar signs for special purpose applications such as area of refuge/rescue assistance.

B. All Exit Signs: Internally illuminated with LEDs unless otherwise indicated; complying with NFPA 101 and all applicable state and local codes, and listed and labeled as complying with UL 924.
1. Number of Faces: Single or double as indicated or as required for the installed location.
2. Directional Arrows: As indicated or as required for the installed location.

C. Self-Powered Exit Signs:
1. Operation: Upon interruption of normal power source or brownout condition exceeding 20% voltage drop from nominal, solid-state control automatically switches connected lamps to integral battery power for minimum of 90 minutes of rated emergency illumination, and automatically recharges battery upon restoration of normal power source.
2. Battery: Sealed maintenance-free nickel cadmium unless otherwise indicated.
3. Diagnostics: Provide power status indicator light and accessible integral test switch to manually activate emergency operation.
4. Provide low-voltage disconnect to prevent battery damage from deep discharge.
5. Self-Diagnostics: Provide units that self-monitor functionality and automatically perform testing required by NFPA 101 where indicated; provide indicator light(s) to report test and diagnostic status.

D. Accessories:
1. Provide compatible accessory high impact polycarbonate vandal shields where indicated.
2. Provide compatible accessory wire guards where indicated.

2.06 DRIVERS:

A. LED Drivers:
1. Provide LED drivers that are UL recognized complying with UL 8750.
2. Inrush Current: Not exceeding peak currents specified in NEMA 410.
3. Input Voltage: Suitable for operation at voltage of connected source, with variation tolerance of ±10%.
4. Total Harmonic Distortion: Not greater than 20%.
5. Power Factor: Not less than 0.95.
6. Sound Rating: Class A, suitable for average ambient noise level of 20 to 24 decibels.
7. Compatibility: Specifically designed for use with the specified LEDs, with no visible flicker and for full light output unless dimmer or bi-level switching control is indicated.
8. Driver Operating Frequency: Greater than 40 kHz.
9. Current Crest Factor: Not greater than 1.5.

10. Surge Tolerance: Capable of withstanding characteristic surges according to IEEE C62.41.2, location category A.
11. Electromagnetic Interference/Radio Frequency Interference (EMI/RFI) Limits: Comply with FCC requirements of CFR, Title 47, Part 18, for Class A, non-consumer applications.
12. Driver Marking: Include wiring diagrams with lamp connections.

2.07 EMERGENCY DRIVERS:

A. LED Emergency Drivers:
1. Description: Self-contained, battery powered, LED emergency driver units suitable for use with indicated luminaires, complying with NFPA 101 and all applicable state and local codes, and listed and labeled as complying with UL 924.
2. Compatibility:
   a. Drivers: Compatible with AC drivers and LED loads rated for Class 2 output.
   b. Lamps: Compatible with LED lamp manufacturer supplied.
3. Operation: Upon interruption of normal power source, solid-state control automatically switches connected lamp(s) to the emergency driver for minimum of 90 minutes of rated emergency illumination, and automatically recharges battery upon restoration of normal power source.
4. Emergency drivers shall include sufficient time delays to prevent overcurrent of the LED's in the event both emergency and standard drivers supply load simultaneously.
5. Battery:
   a. Sealed maintenance-free high-temperature nickel cadmium unless otherwise indicated. Minimum of 7 year life expectancy.
   b. Recharge time shall be 24 hours or less.
6. Diagnostics: Provide accessible and visible multi-chromatic combination test switch/indicator light to display charge, test, and diagnostic status and to manually activate emergency operation.
7. Self-Diagnostics: Provide units that self-monitor functionality and automatically perform testing required by NFPA 101 where indicated; provide indicator light(s) to report test and diagnostic status and field selectable audible alert.
8. Operating Temperature: From 32ºF (0ºC) to 122ºF (50ºC) unless otherwise indicated or required for the installed location.
9. Accessories:
   a. Provide compatible accessory remote combination test switch/indicator light where indicated.

2.08 LAMPS:

A. All Lamps:
1. Unless explicitly excluded, provide new, compatible, operable lamps in each luminaire.
2. Verify compatibility of specified lamps with luminaires to be installed. Where lamps are not specified, provide lamps per luminaire manufacturer's recommendations.
3. Lamp Bases: Comply with ANSI C81.61.
4. Minimum Efficiency: Provide lamps complying with all current applicable federal and state lamp efficiency standards.
5. Color Temperature Consistency: Unless otherwise indicated, for each type of lamp furnish products which are consistent in perceived color temperature. Replace lamps that are determined by the Engineer to be inconsistent in perceived color temperature.

B. LED Lamps: Wattage and bulb type as indicated, with base type as required for luminaire.

1. Correlated Color Temperature (CCT):
   (1) Indoor: 3,500 K and 4000K unless otherwise indicated.
   (2) Outdoor: 4,000K unless otherwise indicated.
2. Color Rendering Index (CRI): Not less than 80.
3. Average Rated Life: Not less than 50,000 hours for an operating cycle of three hours per start.
4. Lamps shall be dimmable from 100% to 1% of maximum light output where indicated.

2.09 POLES:

A. General – All Poles:
1. Provide poles and associated support components from single manufacturer suitable for the luminaire(s) and associated supports and accessories to be installed. Refer to luminaire schedule for basis of design poles.
2. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.
3. Material: Aluminum, unless otherwise indicated.
4. Shape: Round tapered, unless otherwise indicated.
5. Finish: Match luminaire finish, unless otherwise indicated.
6. Mounting Height: 10 feet (maximum) above the top of the basins for the poles installed on the treatment basins and 33 feet above finished grade for site poles, unless otherwise indicated.
7. Mounting: Install on concrete foundation, height as indicated on the drawings, unless otherwise indicated.
8. Unless otherwise indicated, provide with the following features/accessories:
   a. Top cap.
   b. Handhole, minimum clear opening of 4 by 6 inches (102 by 153 mm) size, oval shaped, with cover secured by stainless-steel captive screws.
   c. Anchor bolts with leveling nuts or leveling shims.
   d. Anchor base cover.
   e. Brackets: as required.
   f. Hinged pole design for treatment basin poles.
      (1) Provide winch as required to operate hinged mechanisms.
   g. Pole-top tenon,4-inch.
   h. Drill patterns as required for supplied fixtures.
9. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.
   a. Materials: Shall not cause galvanic action at contact points.
   b. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.
   c. Anchor-Bolt Template: Plywood or steel.
10. Breakaway Supports: Frangible breakaway supports, tested by an independent testing agency acceptable to authorities having jurisdiction, according to AASHTO LTS-4-M.

B. Metal Poles: Provide ground lug, accessible from handhole or transformer base.
1. Aluminum Poles:
   a. Poles: Seamless, extruded structural tube complying with ASTM B429/B429M, Alloy 6063-T6 with access handhole in pole wall.
   b. Poles: ASTM B209 (ASTM B209M), 5052-H34 marine sheet alloy with access handhole in pole wall.

(1) Shape: Round, tapered.
(2) Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.

c. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.

d. Grounding and Bonding Lugs: Welded 1/2-inch (13-mm) threaded lug, listed for attaching grounding and bonding conductors of type and size indicated, and accessible through handhole.

e. Brackets for Luminaires: Detachable, with pole and adapter fittings of cast aluminum. Adapter fitting welded to pole and bracket, then bolted together with stainless-steel bolts.
(1) Tapered oval cross section, with straight tubular end section to accommodate luminaire.
(2) Finish: Same as luminaire.

f. Factory Applied Aluminum Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
(1) Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
(2) Natural Satin Finish: Provide fine, directional, medium satin polish (AAM32); buff complying with AA-M20; and seal aluminum surfaces with clear, hard-coat wax.
(3) Class I, Clear Anodic Finish: AA-M32C22A41 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.
(4) Class I, Color Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker) complying with AAMA 611.
(a) Color: Coordinate with Architect and Owner.

2.10 GROUNDING AND BONDING LUGS:

A. Welded ½-inch (13-mm) threaded lug, complying with requirements in Section 26 05 26 - Grounding and Bonding for Electrical System, listed for attaching grounding and bonding conductors of types and size indicated, and accessible through handhole.

2.11 PHOTO ELECTRIC CONTROL DEVICES (PHOTOCELLS):

A. Rated for multiple control of lighting fixtures as indicated.
B. Turns lights "on" at 3 footcandles, "off" at 8 footcandles.
C. Flush-mounted, weatherproof cell rated 1000-watts at 120Vac or 277Vac, as indicated.
D. Operates from -40°C to 70°C (-40°F to 158°F).
E. Intermatic 4000 Series, Fisher-Pierce FT15, Cooper-Crouse Hinds D2S20, or Engineer approved equal.
F. FD box.
G. Locations as indicated.
H. Lighting Controllers: As specified on the contract drawings.

2.12 ACCESSORIES:

A. Interior Lighting:
   1. Stems for Suspended Luminaires: Steel tubing, minimum 1/2 inch size, factory finished to match luminaire or field-painted as directed.
   2. Threaded Rods for Suspended Luminaires: Zinc-plated steel, minimum 1/4 inch size, field-painted as directed.
   3. Hook Hangers for Suspended Luminaires: Integrated assembly matched to luminaire, line voltage, and equipment with threaded attachment, cord, and locking-type plug. Hook hanger shall include safety latch.
   4. Provide accessory plaster frames for luminaires recessed in plaster ceilings.

B. Exterior Lighting:
   1. Base Covers: Manufacturers' standard metal units, arranged to cover pole's mounting bolts and nuts. Finish same as pole.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify that field measurements are as shown on the drawings.
B. Verify that outlet boxes are installed in proper locations and at proper mounting heights and are properly sized to accommodate conductors in accordance with NFPA 70.
C. Verify that suitable support frames are installed where required.
D. Verify that branch circuit wiring installation is completed, tested, and ready for connection to luminaires.
E. Verify that conditions are satisfactory for installation prior to starting work.

3.02 PREPARATION:

A. Provide extension rings to bring outlet boxes flush with finished surface.
B. Clean dirt, debris, plaster, and other foreign materials from outlet boxes.

3.03 INSTALLATION:

A. Coordinate locations of outlet boxes provided under Section 26 05 33 – Raceways, Boxes, Seals, and Fittings for Electrical Systems as required for installation of luminaires provided under this Section.
B. Install products according to manufacturer's instructions.
C. Install luminaires securely, in a neat and workmanlike manner, as specified in NECA 1 (general workmanship), NECA 500 (commercial lighting), NECA 501 (exterior lighting), and NECA 502 (industrial lighting).
D. Install luminaires plumb and square and aligned with building lines and with adjacent luminaires.
E. Supports:
   1. Sized and rated for luminaire weight.
   2. Able to maintain luminaire position after cleaning and relamping.
   3. Provide support for luminaire without causing deflection of ceiling or wall.
   4. Luminaire mounting devices shall be capable of supporting a horizontal force of 100% of luminaire weight and vertical force of 400% of luminaire weight.
F. Suspended Ceiling Mounted Luminaires:
   1. Do not use ceiling tiles to bear weight of luminaires.
   2. Do not use ceiling support system to bear weight of luminaires unless ceiling support system is certified as suitable to do so.

3. Secure surface-mounted and recessed luminaires to ceiling support channels or framing members or to building structure.
4. Secure pendant-mounted luminaires to building structure.
5. Secure to any required outlet box.
6. Secure lay-in luminaires to ceiling support channels using UL listed safety clips at four corners.
7. In addition to ceiling support wires, provide two galvanized steel safety wire(s), minimum 12 gage, connected from opposing corners of each recessed luminaire to building structure.
8. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two 3/4-inch (20-mm) metal channels spanning and secured to ceiling tees.
9. Install at least one independent support rod or wire from structure to a tab on luminaire. Wire or rod shall have breaking strength of the luminaire weight at a safety factor of 3.
10. See appropriate Division 09 Section where suspended grid ceiling is specified for additional requirements.

G. Recessed Luminaires:
1. Secured to outlet box.
2. Attached to ceiling structural members at four points equally spaced around perimeter of luminaire.
3. Install trims tight to mounting surface with no visible light leakage.
4. Non-IC Rated Luminaires: Maintain required separation from insulation and combustible materials according to listing.
5. Luminaires Recessed in Fire-Rated Ceilings: Install using accessories and firestopping materials to meet regulatory requirements for fire rating.

H. Suspended Luminaires:
1. Unless otherwise indicated, specified mounting heights are to bottom of luminaire.
2. Install using the suspension method indicated, with support lengths and accessories as required for specified mounting height.
3. Provide minimum of two supports for each luminaire equal to or exceeding 4 feet in length, with no more than 4 feet (1.2 m) between supports.
4. Install canopies tight to mounting surface.
5. Where longer than 48 inches (1200 mm), brace to limit swinging.
6. Unless otherwise indicated, support pendants from swivel hangers.
7. Provide damping of luminaire oscillations where needed.
8. Continuous Rows of Luminaires: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of luminaire chassis, including one at each end.

I. Wall-Mounted Luminaires: Unless otherwise indicated, specified mounting heights are to center of luminaire.
1. Attach luminaire per manufacturer's recommendations.
2. Do not attach luminaires directly to gypsum board.

J. Pole-Mounted Luminaires:
1. Maintain the following minimum clearances:
   a. Comply with IEEE C2.
   b. Comply with utility company requirements.
2. Poles and Pole Foundations Set in Concrete Paved Areas: Install poles with minimum of 6-inch (150-mm) wide, unpaved gap between the pole or pole foundation and the edge of adjacent concrete slab. Fill unpaved ring with pea gravel to a level 1 inch (25 mm) below top of concrete slab.

3. Raise and set poles using web fabric slings (not chain or cable).
4. Foundation-Mounted Poles:
    a. Provide cast-in-place concrete foundations for poles as indicated, in accordance with Section 03 30 00.
        (1) Install anchor bolts plumb per template furnished by pole manufacturer.
        (2) Position conduits to enter pole shaft.
    b. Install foundations plumb.
    c. Install poles plumb, using leveling nuts or shims as required to adjust to plumb.
    d. Tighten anchor bolt nuts to manufacturer's recommended torque.
    e. Install non-shrink grout between pole anchor base and concrete foundation, leaving small channel for condensation drainage.
    f. Install anchor base covers or anchor bolt covers as indicated.
    g. Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.
    h. Use a short piece of 1/2-inch (13-mm) diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.
5. Grounding:
    a. Bond luminaires, metal accessories, metal poles, and foundation reinforcement to branch circuit equipment grounding conductor.
6. Install separate service conductors, 12 AWG copper, from each luminaire down to handhole for connection to branch circuit conductors.

K. Ground-Mounted Luminaires:
1. Install on concrete base with top 4 inches (100 mm) above finished grade or surface at luminaire location. Cast conduit into base, and finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Section 03 30 00 - Cast-in-Place Concrete.

L. Corrosion Protection:
1. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.
2. Steel Conduits: Comply with Section 26 05 33 – Raceways, Boxes, Seals and Fittings for Electrical Systems.

M. Install accessories furnished with each luminaire.

N. Provide seismic bracing and support such that the light fixtures and/or lamps will not fail during a seismic event.

O. Bond products and metal accessories to branch circuit equipment grounding conductor.

P. Emergency Lighting Units:
1. Unless otherwise indicated, connect unit to unswitched power from same circuit feeding normal lighting in same room or area. Bypass local switches, contactors, or other lighting controls.
2. Install lock-on device on branch circuit breaker serving units.
3. Emergency lighting conductors shall be routed in conduit separate from the normal per circuits.

Q. Exit Signs:
1. Unless otherwise indicated, connect unit to unswitched power from same circuit feeding normal lighting in same room or area. Bypass local switches, contactors, or other lighting controls.
2. Install lock-on device on branch circuit breaker serving units.

R. Emergency Ballasts and Drivers:

1. For field-installed units, install inside luminaire unless otherwise indicated. Where installation inside luminaire is not possible, install on top of luminaire.
2. Unless otherwise indicated, connect unit to unswitched power from same circuit feeding normal ballast(s) or driver(s) in luminaire. Bypass local switches, contactors, or other lighting controls.
3. Install lock-on device on branch circuit breaker serving units.

S. Remote Ballasts and Drivers: Install in accessible location as indicated or as required to complete installation, using conductors per manufacturer's recommendations not exceeding manufacturer's recommended maximum conductor length to luminaire.

T. Lamp Burn-In: Operate lamps at full output for prescribed period per manufacturer's recommendations prior to use with any dimming controls. Replace lamps that fail prematurely due to improper lamp burn-in.

U. Light Sensitive Control Devices:
1. Direct toward the north sky where possible.
2. Set the adjustable control to operate at the specified foot-candle level.
3. Install as indicated.
4. Connect to control lighting fixtures indicated.

3.04 FIELD QUALITY CONTROL:

A. Inspect each product for damage and defects.

B. Operate each luminaire after installation and connection to verify proper operation.

C. Test self-powered exit signs, emergency lighting units, and emergency ballast and drivers to verify proper operation upon loss of normal power supply.

D. Verify operation of photoelectric controls.

E. Correct wiring deficiencies and repair or replace damaged or defective products. Repair or replace excessively noisy ballasts as determined by Engineer.

3.05 ADJUSTING:

A. Aim and position adjustable luminaires to achieve desired illumination as indicated or as directed by Engineer. Secure locking fittings in place.

B. Aim and position adjustable emergency lighting unit lamps to achieve optimum illumination of egress path as required or as directed by Engineer or authority having jurisdiction.

C. Exit Signs with Field-Selectable Directional Arrows: Set as indicated or as required to properly designate egress path as directed by Engineer or authority having jurisdiction.

D. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting the direction of aim of luminaires to suit occupied conditions. Make up to two visits to Project during other-than-normal hours for this purpose. Some of this Work may be required during hours of darkness.

3.06 CLEANING:

A. Clean surfaces according to NECA 500 (commercial lighting), NECA 501 (exterior lighting), NECA 502 (industrial lighting), and manufacturer's instructions to remove dirt, fingerprints, paint, or other foreign material and restore finishes to match original factory finish.

3.07 CLOSEOUT ACTIVITIES:

A. See Section 01 - Closeout Submittals for closeout submittals.

B. Demonstration: Demonstrate proper operation of luminaires to Engineer, and correct deficiencies or make adjustments as directed.

C. Just prior to Substantial Completion, replace all lamps that have failed.

3.08 PROTECTION:

A. Protect installed luminaires from subsequent construction operations.

END OF SECTION 26 50 00

DIVISION 28 – ELECTRONIC SAFETY AND SECURITY

SECTION 28 10 00 – ELECTRONIC ACCESS CONTROL AND INTRUSION DETECTION

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section describes the requirements for access control and intrusion detection systems. The systems shall be user-configurable and scalable.

B. The provided system shall be designed in conformance to the Owner's existing standards for controllers, readers, and other ancillary devices for use and deployment to new project sites.

C. The system shall be provided and installed by the Owner's pre-approved security sub-contractors as follows:
   1. Securitas Technology. 2640 NE Hagan Rd., Lee's Summit, MO 64064.
   2. Engineer approved equal.

D. The new access control system shall coordinate with Section 28 15 23 – Video Intercom Entry System for gate entrance controls.

E. The completed access control system shall include, but not be limited to, the following major components:
   1. Security access control and monitoring software platform including the following as minimum.
      a. Access control system server(s) and associated operating system.
      b. Security workstation(s).
      c. Credential validation database.
      d. Credential card personalization and creation software.
      e. Credential card printer and encoder software.
   2. Access control panels with Ethernet network interfaces.
   3. Access controllers including the following:
      a. Door controllers.
      b. I/O interfaces and expansion modules.
      c. Power supplies, backup batteries, and battery chargers.
   4. Electrified door hardware, electric strikes, egress hardware, panic exit devices, power transfer hinges, and other auxiliary door hardware shall be as specified in Section 08 70 00.
   5. Access control hardware including the following:
      a. Proximity card readers.
      b. Door lock keypads.
      c. Combination card readers with keypad.
      d. Request to Exit (REX) motion sensors and push-buttons.
      e. Magnetic lock and panic hardware with special locking arrangement for fire-rated doors.
      f. Near field communication (NFC) access control devices.
      g. Door status and gate status contacts.
      h. Card readers.
      i. Entry pedestals for gates or doors.
      j. Power supplies as required.

6. Intrusion detection hardware including the following:
    a. Motion sensors.
    b. Break glass sensors.

F. The complete IP based intercom/video entry system shall include, but not limited to, the following major components:
1. Intercom/video door stations.
2. Master stations (IP Phone).
3. Gate pedestal(s).
4. Power supplies as required.

G. The Contractor shall be responsible for providing fully operational security access control/intrusion detection and intercom/video systems as indicated on drawings. All necessary hardware and software required for the complete system shall be the responsibility of the Contractor and shall be provided under this Contract with no additional costs to the Owner.

H. Coordinate with the door hardware vendor for door lock types and door hardware to ensure a fully integrated and functional system.

I. Conduit and cabling requirements shall be coordinated with the electrical sub-contractor as required for raceways and installation of cables.

J. All equipment shall be UL listed.

1.03 RELATED REQUIREMENTS:

A. Section 08 71 00 – Door Hardware.
B. Section 26 05 19 – Electrical Power Conductors and Cables.
C. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
D. Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
E. Section 28 15 23 – Video Intercom System
F. Section 28 20 00 – Video Surveillance System.
G. Section 32 31 13 – Chain-Link Fences and Gates.
H. Section 40 66 00 – Process Control Networks.

1.04 REFERENCE STANDARDS:

A. American Water Works Association (AWWA)
1. Guidelines for Physical Security

B. Electronic Components Industry Association (ECIA):
1. EIA/ECA-310-E – Cabinets, Racks, Panels, and Associated Equipment.

C. National Fire Protection Association (NFPA):
1. 70 – National Electrical Code (NEC).

D. National Electrical Manufacturers Association (NEMA):
1. 250 – Enclosures for Electrical Equipment (1,000V maximum).

E. Underwriters Laboratories (UL):
1. 50 – Enclosures for Electrical Equipment.

1.05 SUBMITTALS:

A. Submit as specified in Division 1.

B. Manufacturer with prime responsibility shall assume responsibility for all Compliance Submittals.

C. Product Data: Submit the following for each type of product specified and included as minimum:
1. Data sheets for all components furnished.

D. Qualification Statements: - Fabricator's qualifications.
E. Shop Drawings: Provide the following as minimum:
   1. Fabrication drawings, front elevation, wiring diagrams, and bills of material for access control panels.
   2. Electrical connection diagrams showing termination locations for all field wiring. External connection diagrams shall indicate cable number and wire color for field cables terminated at the panel.
   3. Engraving schedule and physical dimensions for nameplates.
F. Special Procedure Submittals:
   1. Test Plan:
      a. Provide a complete and detailed test plan for the supplied access control panels.
      b. Include procedures for certification, validation, and testing.
   2. Syllabus for Owner training.
G. Test and Evaluation Reports:
   1. Factory test reports.
   2. Field test reports.
H. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Operation and maintenance manuals for all components furnished.
      b. Certified "As-Built"/"As-Installed" drawings.
      c. Copies of all approved Product Data.
      d. Copies of all approved Test Reports.
      e. Spare parts and supply list.
      f. Warranty Information.
      g. Contractor Information.
I. Maintenance Material Submittals:
   1. Software:
      a. Original downloads and/or flash drives containing all software associated with the supplied equipment.
      b. Organize and submit all software copies on flash media.

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use for at least 1 year prior to Bid opening.
B. The security access control and intrusion detection systems, specified herein, shall be designed and installed by trained and qualified personnel who have ~~minimum of five (5) years of~~ experience designing and installing similar systems per AWWA physical security guidelines for water treatment plants.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Access control panels and associate equipment shall be packaged and shipped to the project site in such a manner as to avoid damage.
B. All equipment shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install the control panel equipment specified herein until designated installation spaces are suitable for intended service.

B. For indoor control panels final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing panel and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. All equipment furnished under this Section shall be warranted by the Contractor and the equipment manufacturer(s) for a minimum period of two years after substantial completion.

B. Warranty shall include all parts, labor, and expenses to perform necessary work.

C. Warranties shall comply with the requirements of Section 01 78 36.

1.10 SPARE PARTS:

A. Provide the following spare parts:

1. Provide five (5) spare fuses of each type used including those used in power supplies.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Access Control System (Controllers, control panels, software and accessories):

1. HID Global.
2. LenelS2.
3. Mercury Security (HID Mercury), HID Global.

B. Door and Gate Contacts:

1. George Risk Industries, Inc.
2. G.E. Interlogix - Sentrol.
3. Honeywell.
4. Engineer approved equal.

C. Request-to-Exit (REX) Motion Detectors:

1. G.E. Security.
2. Honeywell.
3. Bosch Security Systems.
4. Engineer approved equal.

D. Card Readers:

1. HID Global.
2. Engineer approved equal.

2.02 ACCESS CONTROL SYSTEM:

A. The access control system shall include, but is not limited to, access controllers, communications adapters, access control panels, power supplies, and system software.

B. The access control system shall be based on the following or approved equal components:

1. LenelS2 access controllers and software.
2. LenelS2 LNL series interface modules and reader controllers.
3. Software integration into Lenel OnGuard security system platforms. The access controllers shall be fully compatible with peripheral devices associated with access control and intrusion detection devices.

a. Additional licenses or software packages shall be provided as required for a fully functional and integrated access control system.

C. Each access control cabinet shall have a single backplane capable of supporting the required modules. Module quantities shall be as required to support all doors, card readers, and associated monitoring devices to create a fully functional system.

D. The access control system shall be capable of monitoring any alarm devices with dry contact outputs, such as motion sensors, door contacts, etc. Provide relay modules, as required.

E. Each cabinet (or controller modules) shall have the following I/O capabilities as minimum:
   1. Two reader interfaces.
   2. Inputs: 8 programmable as N.O. or N.C.
      a. Door position and Request to Exit (REX).
      b. Tamper and Power Fail Monitors.
   3. Outputs: 4 Form C, SPDT, 5A@ 30VDC.
      a. Two Door Strikes.
      b. Two Auxiliary Alarms.
   4. Communications:
      a. The system shall include an Ethernet network gateway for communications across the security system Ethernet network.
      b. The system shall support serial communication (RS-485) for interconnection of multiple backplanes and downstream interface modules.

F. The system shall be expandable for control of up to 64 access points per site and be networked with unlimited sites.

G. The peripherals, specified in this Section, shall be fully compatible with the specified access control system. The Contractor shall be responsible for integrating the peripherals to the access control system.

H. The network cabling and all required wiring between peripherals and network components shall be provided as recommended by the equipment manufacturers. Color of all security network cables shall be yellow.

I. The access control system shall be fully operational with programmed information. The Contractor shall coordinate with the Owner for the programming input data.

J. The access control system components shall be housed in NEMA 1 lockable enclosures.
   1. The enclosures shall be ventilated and sized to accommodate all required components and dissipate the heat generated in the panel.
   2. The interconnecting cables and wires shall be neatly arranged and installed in wiring channels.
   3. The components shall be DIN rail or shelf mounted inside the enclosure and shall be secured.
   4. Provide DIN-railed mounted terminal strips, as required, inside the enclosure for all field wiring terminations, excluding communication cables. The terminal strips shall be rated for 300V applications and shall be sized to accommodate field wire sizes.

K. Provide all required power supplies for all components housed in the security panel and all peripheral devices connected to the security panel. Power supplies shall have minimum of 25% spare capacity. All power supplies shall be provided with overload and short circuit protection and shall be mounted in the security panel.

L. Each access control panel shall include a 7AH battery (min) with charging system to provide backup in the event of power failure. Battery and charger shall be as recommended by the manufacturer.

M. Software:
1. Provide all required software installed on the new security server and indicated workstations for complete system monitoring and management of the access control system.
2. The software shall store all system transactions in a common database stored on the existing network server. The database shall be accessible by the security system workstation.
3. The System Software Repository shall be configured on the security server using a virtual machine running Windows Server 2016 OS or as required by the provided software. Coordinate with the Owner for Windows Server Licensing.

2.03 DOOR CONTACTS:

A. Coordinate with Section 08 70 00 – Finish Hardware.
B. Recessed mounted door contacts shall meet the following requirements:
1. Designed for recessed mounting in the door frame.
2. 3/4-inch diameter.
3. Minimum 1/2-inch gap in steel doors.
4. Hermetically sealed reed switch with matching actuating magnet.
5. Minimum one foot lead length.
6. Normally closed when active (door is closed).
7. Compatible with specified access control modules.
C. Surface mounted door contacts shall meet the following requirements:
1. Hermetically sealed reed switch with matching actuating magnet.
2. Brushed anodized aluminum housing.
3. Three foot stainless steel armored cable.
4. Mounting bracket as required.
5. Normally closed when active (door is closed).
6. Compatible with specified access control modules.
7. All mounting hardware shall be included for the installation.
8. Compatible with the installation environmental conditions.

2.04 GATE AND OVERHEAD DOOR CONTACTS:

A. The gate and overhead door contacts shall meet the following requirements:
1. Hermetically sealed reed switch with matching actuating magnet.
2. Brushed anodized aluminum housing.
3. 3-inch wide operation gap distance.
4. Minimum three foot stainless steel armored cable.
5. Mounting bracket as required.
6. Normally open contact.
7. Compatible with specified access control modules.

2.05 MOTION REQUEST TO EXIT (REX) DETECTORS:

A. Provide motion REX detectors when indicated. The motion REX detector shall meet the following requirements:
1. Dual technology utilizing passive infrared and radar technology.
2. Voltage: 12 to 24 Vac/Vdc.
3. Alarm Output: DPDT Form C contact.
4. Alarm duration: Adjustable from 0.5 – 60 seconds.

5. Adjustable detection range 5-15 feet.
6. Activation LED.
7. Operating temperature: -29°C to 49°C., 0 to 95% non-condensing
8. All mounting hardware (wall mount) shall be included for the installation.

2.06 MANUAL REQUEST TO EXIT:

A. Refer to Division 08 for exit devices integral to door hardware.
B. Where exit device is not integral to door hardware, provide manual request to exit pushbutton as follows:
   1. Green with "PUSH TO EXIT" lettering.
   2. Stainless steel cover plate.
   3. Momentary SPDT contact rated minimum 1A at 24-Vdc.
   4. FS or FD box mounting.
   5. Mounting:
      a. Finished Spaces: Recessed.
      b. Unfinished Spaces: Surface-mount.

2.07 CARD READER:

A. The card reader shall meet the following requirements:
   1. Read range: Up to 3 inches with compatible card.
   2. Input voltage: 5–16Vdc at reader.
   3. Operating temperature: -30°C to 65°C.
   4. Enclosure: The reader shall be of potted, polycarbonate material, sealed to a NEMA rating of 4X.
   5. LED indicator with tri-color standard (red, green, amber or blue).
   6. Audio tone.
   7. Output format: Wiegand.
   8. Frequency: 125 kHz (excitation).
   9. Factory or field programmable.
   10. Rated for indoor and outdoor installation.
   11. Compatible with specified access control modules.
B. Reader shall be compatible with Owner's existing standard HID Proximity Access Cards.
   1. Provide HID 20NKS series card readers, or Engineered-approved equal, where mullion-mounted.
   2. Provide HID 40NKS series card readers, or Engineered-approved equal, for all other locations.

2.08 WIRING SYSTEM:

A. Provide basic wiring materials which comply with Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables and Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
B. Wire and cabling types shall be in accordance with the requirements of the system manufacturer and as indicated on the drawings.
C. Provide raceways and wiring required for fully operational systems. Coordinate with Division 26 for raceways.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing the access control panels and shall be maintained for the remainder of the construction period.

3.02 INSTALLATION:

A. All components shall be installed in accordance with the manufacturer's installation manuals and recognized industry practices.

B. Provide all labor, materials, startup, programming, etc. for a fully functioning system.

C. Mount equipment plumb, level, square, and secure.

D. Installation of basic wiring system materials:

1. Install wiring, raceways, and electrical boxes and fittings in accordance with Section 26 05 19 – Electrical Power Conductors and Cables and Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
2. Install all wiring in raceways.
3. Where possible, install wires and cables without splices. Make connections and splices at terminal strips in terminal boxes, cabinets or at equipment terminals.

3.03 PROGRAMMING:

A. Access Control:

1. The access control system shall be programmed to allow access to the indicated areas. Coordinate with the Owner for a complete list of employees and access control rights.
2. Program the database tags, descriptions, and alarm reports in a clear and concise manner.
3. The security access control for the entrance/exit automatic gate operators shall meet the following sequence of operations. Coordinate with gate equipment to be supplied under Section 32 31 00.
    a. Normal Request for Entry:
        (1) The security access control system shall open the gate when the request for entry is made via the entry card reader.
    b. Intercom Assisted Entry:
        (1) The intercom system shall be utilized to request entry at the associated gate through video and voice interaction.
        (2) When the intercom call button is pressed a call notification is sent to each master station (IP Phone). The call may be answered by any master station. If it is determined by the master station user that the gate needs to be opened, the user will provide a card swipe action to initiate the gate operator.
        (3) The card swipe will log the user approving the gate open action through the security system log.
    c. Emergency Entry:
        (1) A knox box shall be provided for emergency services entry in the event operations staff is not available. An access card shall be programmed and stored in the knox box for use by emergency service personnel. Coordinate with the local emergency services.
    d. Normal Request to Exit:

(1) The gate shall be designed for a free exit using an inductive loop request to exit. If the inductive loop detects the presence of a vehicle the request-to-exit contact shall be activated to the gate access control module and the gate shall open.

e. Manual request to Exit:
(1) A card reader shall be provided on the secure side of each entrance gate at the security network enclosure. When a valid card swipe is detected, the request-to-exit contact shall be activated to the gate access control module and the gate shall open.

f. Gate close operation:
(1) Once the gate reaches its full open status, the gate shall be programmed to stay open for 30 seconds (adjustable) before the gate starts its closing cycle. The gate closing cycle shall be inhibited if the gate operator and associated protective devices detect any obstruction along the closing path of the gate.

4. The security access control for a typical man door shall meet the following sequence of operations:
a. Normal Request for Entry:
(1) The security access control system shall release the associated electric strike when the request for entry is made via the man door card reader. The electric strike shall be released and remain released for 6 seconds (adjustable) before the system secures the man door lock.

b. Normal Request to Exit:
(1) The man door shall be designed for a free exit using a request to exit push button, a motion sensing device, or integral request to exit contact in the associated door hardware set as indicated. The request to exit devices shall initiate a contact closure to the access control module exit circuit. The access control module shall release the door and give a permissive to the system for a free exit. The system shall incorporate a 10 second time delay (adjustable) after the request to exit is given to complete the exit cycle.

c. Forced Door:
(1) In the event the door contact status changes to open without a card swipe permissive or request to exit, the system shall initiate an alarm at the security workstation.

3.04 FIELD QUALITY CONTROL:

A. Manufacturer's Field Services:
1. The equipment supplier shall provide the field services of a trained technician for the amount of time required to commission, test and start-up all equipment provided.
2. All travel and living expenses shall be included for all trips to the site. All equipment required for testing, start-up and performance verification shall be provided by the start-up technician.

B. Check all internal and external connections and tighten as required.
C. Perform I/O checkout on all points and verify proper operation.
D. Verify proper connection of communication cabling and proper communication system configuration.
E. Field verify proper operation of all inputs and outputs.
F. Record results of I/O checkout and submit test reports as specified in Division 01.

3.05 ADJUSTING AND CLEANING:

A. After field installation and final wiring terminations are completed the access control panel wiring and cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.
B. Wiring duct covers shall be replaced and secured as required.
C. Prior to final acceptance control panel interior and exterior shall be wiped clean and free from dust and debris.

3.06 TRAINING:

A. The Security System Supplier shall provide formal training for operators, maintenance and service personnel.
B. A training schedule and log shall be developed. The training schedule shall identify scheduled dates and times for all training sessions specified in this Division. The training log shall identify dates for training and record training session attendees.
C. Training sessions shall be scheduled with the Owner a minimum of two weeks prior to occurrence and a training schedule shall be maintained and communicated to the Owner on a routine basis.
D. Provide a minimum of 2 hours of training at the customer's facility for operations, maintenance and service personnel.
    1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
    2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, faults, diagnostic tools, troubleshooting, and preventive maintenance.
    3. Hands-on training shall be provided on equipment.
    4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.
E. Contractor shall make digital video recordings of all on-Site training for training purposes. Any charges for this video recording shall be included.
F. Provide training as specified in each applicable Section, this Division.

END OF SECTION 28 10 00

SECTION 28 15 23 – VIDEO INTERCOM ENTRY SYSTEM

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section describes the requirements for gate access control and video intercom systems. The systems shall be user-configurable and scalable.

B. The complete IP based intercom/video system shall include, but not be limited to, the following major components:
   1. Security network control panels and power supplies.
   2. Raceways. Coordinate requirements with Division 26.
   3. Wire and Cabling.
   4. Intercom/video entry stations.
   5. Intercom/video master station IP Phone.
   6. Gate pedestal(s).
   7. Card Readers. Coordinate with Section 28 10 00.
   8. Gate operators, gate safety devices, and gate motor controller shall be as specified in Section 32 31 13 – Chain Link Fences and Gates.

C. The subcontractor shall be responsible for providing fully operational gate security access control and intercom/video systems as indicated on drawings. All necessary hardware and software required for the complete system shall be the responsibility of the subcontractor.

D. The system shall be provided and installed by the Owner's pre-approved security sub-contractor as follows:
   1. Video Surveillance Systems:
      a. Electronic Technology, Inc. (ETI), 5700 Merriam Drive, Merriam, Kansas 66203.

E. Coordinate scope of supply with Section 28 20 00 – Video Surveillance System and Section 28 10 00 – Electronic Access Control and Intrusion Detection as required.

F. Coordinate with the entrance gate hardware vendor for to ensure a fully integrated and functional system.

G. Conduit and cabling requirements shall be coordinated with the equipment supplied and as indicated for installation of cables.

H. All equipment shall be UL listed.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 19 – Electrical Power Conductors and Cables.
B. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
C. Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
D. Section 28 10 00 – Electronic Access Control and Intrusion Detection.
E. Section 28 20 00 – Video Surveillance System.
F. Section 32 31 13 – Chain-Link Fences and Gates.
G. Section 40 66 00 – Process Control Networks.

1.04 REFERENCE STANDARDS:

A. American Water Works Association (AWWA)
   1. Guidelines for Physical Security

B. Electronic Components Industry Association (ECIA):
   1. EIA/ECA-310-E – Cabinets, Racks, Panels, and Associated Equipment.

C. National Fire Protection Association (NFPA):
   1. 70 – National Electrical Code (NEC).
D. National Electrical Manufacturers Association (NEMA):
   1. 250 – Enclosures for Electrical Equipment (1,000V maximum).
E. Underwriters Laboratories (UL):
   1. 50 – Enclosures for Electrical Equipment.

1.05 SUBMITTALS:

A. Submit as specified in Division 1.
B. Manufacturer with prime responsibility shall assume responsibility for all Compliance Submittals.
C. Product Data: Submit the following for each type of product specified and included as minimum:
   1. Data sheets for all components furnished.
D. Qualification Statements: Fabricator's qualifications.
E. Shop Drawings: Provide the following as minimum:
   1. Fabrication drawings, front elevation, wiring diagrams, and bills of material for access control panels.
   2. Electrical connection diagrams showing termination locations for all field wiring. External connection diagrams shall indicate cable number and wire color for field cables terminated at the panel.
   3. Engraving schedule and physical dimensions for nameplates.
F. Special Procedure Submittals:
   1. Test Plan:
      a. Provide a complete and detailed test plan for the supplied access control panels.
      b. Include procedures for certification, validation, and testing.
   2. Syllabus for Owner training.
G. Test and Evaluation Reports:
   1. Factory test reports.
   2. Field test reports.
H. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Operation and maintenance manuals for all components furnished.
      b. Certified "As-Built"/"As-Installed" drawings.
      c. Copies of all approved Product Data.
      d. Copies of all approved Test Reports.
      e. Spare parts and supply list.
      f. Warranty Information.
      g. Subcontractor Information.
I. Maintenance Material Submittals:
   1. Software:
      a. Original downloads and/or flash drives containing all software associated with the supplied equipment.
      b. Organize and submit all software copies on flash media.

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use for at least 1 year prior to Bid opening.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Security control panels and associate equipment shall be packaged and shipped to the project site in such a manner as to avoid damage.

B. All equipment shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install the control panel equipment specified herein until designated installation spaces are suitable for intended service.

B. For indoor control panels final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing panel and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. All equipment furnished under this Section shall be warranted by the Subcontractor and the equipment manufacturer(s) for a minimum period of two years after substantial completion.

B. Warranty shall include all parts, labor, and expenses to perform necessary work.

C. Warranties shall comply with the requirements of Section 01 78 36.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Intercom/Video System:

1. Axis Communications.
   a. Intercom Station: Axis I8016-LVE.
2. Grandstream Networks, Inc.
   a. Master Station: IP Telephone GXV3370.
3. Engineer approved equal.

2.02 INTERCOM/CAMERA SYSTEM:

A. A complete IP based integrated hands-free intercom and video system shall be manufactured by Axis Communications.

B. The complete system shall include, but not limited to, the following:

1. Provide one master stations in the administration building control room.
2. Provide door stations at the following locations:
   a. Main entrance gate pedestal.
3. Master Station – shall be an IP based desktop video phone for used with SIP based systems. The unit shall feature a 7" touch screen TFT LCD, built-in Wi-Fi and Bluetooth, dual-switched auto-sensing 10/100/1000Mbps network port, and speaker phone. Built-in PoE/PoE+ to power the device. Programmable for communicating to the specified door station and provide for control of the door station output relay.
4. Door Station – NEMA 4X, Vandal resistant, flush mount, color video entry intercom device. The station shall include support for Session Initiation Protocol (SIP) for integration with VoIP systems and peer to peer sessions. The unit shall be provided with the necessary mounting box to facilitate installation. The faceplate shall be stainless steel, the call button shall be stainless and the camera shall be protected with a clear lens cover. The door station shall feature a color CMOS camera, speaker, and mic for communication, and illumination LED for low light conditions. The door station shall support ONVIF Profile G, M, S, and T.

a. The door stations shall be capable of providing a closed contact output for operating entrance gate equipment from the master stations.

2.03 PEDESTALS:

A. Provide a dual level 42-inch/80-inch gooseneck pedestal with offset for mounting of enclosures for access control card readers and intercom/camera. The stand shall be hollow to allow for the passage of cables and shall be designed for mounting on a concrete foundation.
B. Provide lockable NEMA 4 enclosures with rain shield over the face mounted components for mounting of indicated devices. Enclosure shall be sized to accommodate the indicated components.
C. Pedestal and enclosure shall be provided with a black powder-coated corrosion resistant finish.
D. Refer to Contract Drawings for pedestal configurations.
E. Coordinate with card readers and intercom stations supplied.

2.04 WIRING SYSTEM:

A. Provide basic wiring materials which comply with Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables and Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
B. Wire and cabling types shall be in accordance with the requirements of the system manufacturer.
C. Provide the necessary raceways and wiring required for a fully operational systems.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment.
B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing the access control panels and shall be maintained for the remainder of the construction period.

3.02 INSTALLATION:

A. All components shall be installed in accordance with the manufacturer's installation manuals and recognized industry practices.
B. Provide all labor, materials, startup, programming, etc. for a fully functioning system.
C. Mount equipment plumb, level, square, and secure.
D. Installation of basic wiring system materials:
   1. Install wiring, raceways, and electrical boxes and fittings in accordance with Section 26 05 19 – Electrical Power Conductors and Cables and Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
   2. Install all wiring in raceways.
   3. Where possible, install wires and cables without splices. Make connections and necessary splices at terminal strips in terminal boxes, cabinets or at equipment terminals.

3.03 PROGRAMMING:

A. Access Control:
   1. The security access control for the entrance/exit automatic gate operators shall meet the following sequence of operations. Coordinate with equipment to be supplied under Section 32 31 13.

a. Normal Request for Entry:
   (1) The gate entry control system shall open the gate when the request for entry is made via the entry card reader.
b. Intercom Assisted Entry:
   (1) The intercom system shall be utilized to request entry at the associated gate through video and voice interaction.
   (2) When the intercom call button is pressed a call notification is sent to each master station. The call may be answered by any master station. If it is determined by the master station user that the gate needs to be opened, the user will provide a card swipe action or push-button action through the master station interface to initiate the gate operator.
c. Emergency Entry:
   (1) A knox box shall be provided for emergency services entry in the event operations staff is not available. An access card shall be programmed and stored in the knox box for use by emergency service personnel.
   (2) Coordinate with the local emergency services and Owner for emergency procedures and protocols.
d. Normal Request to Exit:
   (1) The gate shall be designed for a free exit using an inductive loop request to exit. If the inductive loop detects the presence of a vehicle the request-to-exit, contact shall be activated to the gate access control module and the gate shall open.
e. Gate close operation:
   (1) Once the gate reaches its full open status, the gate shall be programmed to stay open for 30 seconds (adjustable) before the gate starts its closing cycle. The gate closing cycle shall be inhibited if the gate operator and associated protective devices detect any obstruction along the closing path of the gate.

B. Intercom/Video System:
   1. The intercom/video system shall be programmed to allow communication between the entrance gate and the master station within the administration building operations control room.
   2. The video streams shall be programmed to stream video to the security access control software package using the Ethernet network ONVIF compatible client. Provide the necessary programming and drivers required for this functionality.

3.04 FIELD QUALITY CONTROL:

A. Manufacturer's Field Services:
   1. The equipment supplier shall provide the field services of a trained technician for the amount of time required to commission, test and start-up all equipment provided.
   2. All travel and living expenses shall be included for all trips to the site. All equipment required for testing, start-up and performance verification shall be provided by the start-up technician.
B. Check all internal and external connections and tighten as required.
C. Perform I/O checkout on all points and verify proper operation.
D. Verify proper connection of communication cabling and proper communication system configuration.
E. Field verify proper operation of all inputs and outputs.
F. Record results of I/O checkout and submit test reports as specified in Division 1.

3.05 ADJUSTING AND CLEANING:

A. After field installation and final wiring terminations are completed the access control panel wiring and cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.
B. Wiring duct covers shall be replaced and secured as required.
C. Prior to final acceptance control panel interior and exterior shall be wiped clean and free from dust and debris.

3.06 TRAINING:

A. The subcontractor or supplier shall provide training for operators, maintenance, and service personnel.
B. A training schedule and log shall be developed. The training schedule shall identify scheduled dates and times for all training sessions specified in this Division. The training log shall identify dates for training and record training session attendees.
C. Training sessions shall be scheduled with the Owner a minimum of two weeks prior to occurrence and a training schedule shall be maintained and communicated to the Owner on a routine basis.
D. Provide a minimum of 1 hours of training at the customer's facility for the gate entrance video/intercom system.
E. Provide training as specified in each applicable Section, this Division.
F. The Owner at their option shall be allowed to video record all training sessions for future reference.

END OF SECTION 28 15 23

SECTION 28 20 00 – VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section describes the requirements for Video Surveillance System as indicated on the Drawings and specified herein.

B. The completed system shall include, but not be limited to, the following major components:
   1. Surveillance Cameras.
   2. Security Server, Security Client Workstation, and Server management software for IP Cameras.
   3. Security network switches.
   4. Fiber and UTP cables.
   5. Fiber patch panels, media converters and other hardware interfaces.
   6. Field cabinets.
   7. Power supplies.
   8. Raceways.

C. The Subcontractor shall be responsible for providing Video Surveillance devices fully installed and operational for use by the Owner.

D. The system shall be provided and installed by the Owner's pre-approved security sub-contractor as follows:
   1. Video Surveillance Systems:
      a. Electronic Technology, Inc. (ETI), 5700 Merriam Drive, Merriam, Kansas 66203.

E. Coordinate scope of supply with Section 28 10 00 – Electronic Access Control, Intrusion Detection, Section 28 15 23 Video Intercom System, and Division 40 for shared network infrastructure, shared large display monitors, and additional security management software and server requirements.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 19 – Electrical Power Conductors and Cables.
B. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
C. Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
D. Section 28 15 23 – Video Intercom Entry System.
E. Section 40 66 00 – Process Control Networks.

1.04 REFERENCE STANDARDS:

A. American Water Works Association (AWWA)
   1. Guidelines for Physical Security.

B. Electronic Components Industry Association (ECIA):
   1. EIA/ECA-310-E – Cabinets, Racks, Panels, and Associated Equipment.

C. National Fire Protection Association (NFPA):
   1. 70 – National Electrical Code (NEC).

D. National Electrical Manufacturers Association (NEMA):
   1. 250 – Enclosures for Electrical Equipment (1,000V maximum).

E. Underwriters Laboratories (UL):
   1. 50 – Enclosures for Electrical Equipment.

1.05 SUBMITTALS:

A. Submit as specified in Division 1.

B. Manufacturer with prime responsibility shall assume responsibility for all Compliance Submittals.

C. Product Data: Submit the following for each type of product specified and included as minimum:

1. Data sheets for all components furnished.

D. Installation Plan:

1. Provide recommended installation locations and mounting heights.

~~D.~~E. Qualification Statements:

1. Fabricator's qualifications.

~~E.~~F. Shop Drawings: Provide the following as minimum:

1. Wiring diagrams and bills of material for the complete video surveillance system.
2. Electrical connection diagrams showing termination locations for all field wiring. External connection diagrams shall indicate cable number and wire color for field cables terminated at the panel.
3. Engraving schedule and physical dimensions for nameplates.

~~F.~~G. Special Procedure Submittals:

1. Test Plan:
   a. Provide a complete and detailed test plan for the supplied equipment
   b. Include procedures for certification, validation, and testing.
2. Syllabus for Owner training.

~~G.~~H. Test and Evaluation Reports:

1. Factory test reports.
2. Field test reports.

~~H.~~I. Closeout Submittals: Final documentation shall include the following as minimum:

1. Operation and Maintenance Manuals including the following:
   a. Operation and maintenance manuals for all components furnished.
   b. Certified As-Built/As-Installed drawings.
   c. Copies of all approved Product Data.
   d. Copies of all approved Test Reports.
   e. Spare parts and supply list.
   f. Warranty Information.
   g. Subcontractor Information.

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use for at least 1 year prior to Bid opening.

B. The Video Surveillance systems, specified herein, shall be designed and installed by trained and qualified personnel who have ~~minimum of five (5) years of~~ experience installing similar systems per AWWA physical security guidelines for water treatment plants.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Surveillance Cameras and associate equipment shall be packaged and shipped to the project site in such a manner as to avoid damage.

B. All equipment shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install the video surveillance equipment specified herein until designated installation spaces are suitable for intended service.

B. For indoor network equipment final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to network switch commissioning and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. All equipment shall be provided with a minimum one-year warranty period.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Surveillance Cameras:
   1. Axis Communications.
      a. Axis P3719-PLE (15MP).
      b. Axis Q3538-LVE (8MP).

B. Security Switches:
   1. Rack mounted and panel mounted network switches shall comply with Section 40 66 00 – Process Control Networks.

C. Video Management Software:
   1. Genetec Inc.
      a. Genetec Security Center Software.

D. Security Server:
   1. Genetec StreamVault SV-2000E appliance.
   2. Engineer-approved equal.

2.02 VIDEO SURVEILLANCE SYSTEM:

A. The video surveillance system shall include, but not limited to, surveillance cameras, security server, client workstation, mounting hardware, CAT6 and fiber cabling, PoE injectors and extenders, surge suppression, and power supplies.

B. The video management software shall provide the necessary interface to view, control, and configure the network security cameras. The software shall be capable of addressing and viewing of ONVIF profile S and T device streams attached to the security network. The software system shall include video analytics to improve operator efficiency. The system shall include mobile viewing capabilities, streaming profiles, timeline visualization of recorded events as well as snapshots in live view and playback modes. The software shall include configurable recording capabilities for the connected devices.

C. A new rack mounted security server, security client workstation, security switches, cameras, and associated software configurations shall be provided as indicated and required for a complete system.
   1. Mounting locations for the specified equipment shall be as indicated on the Contract Drawings.

D. Video coverage shall include views of all locations indicated with motion detection activated on the cameras for large open areas of the plant.

E. Use 8MP dome camera with varifocus and zoom for entrance gate.

F. Use 15MP multidirectional cameras (360 degree coverage) for all large open area views.

G. The peripherals, specified in this Section, shall be fully compatible with the specified surveillance cameras.
H. The network cabling and all required wiring between peripherals and network components shall be provided as indicated and shall be as recommended by the equipment manufacturers.

2.03 MOUNTING HARDWARE AND ACCESSORIES:

A. Provide the necessary mounting hardware for each camera application.
B. Mounting accessories include but not limited to the following:
   1. Pole mounting hardware.
   2. Wall mount.
   3. Pendant kit.
   4. Corner mounting bracket.
C. PoE Extender:
   1. Provide PoE extenders as required and indicated for cameras exceeding the manufacturer's maximum recommended distance for a single PoE cable run.
   2. Provide AXIS T8129 PoE extender or Engineer-approved equal and associated mounting enclosures as indicated or required. Outdoor enclosures shall be rated NEMA 4X stainless steel

2.04 MEDIA CONVERTERS:

A. Media converters shall be provided to convert from fiber optic cabling to copper category 6 cabling for locations indicated or required.
B. The media converter shall convert between 10/100BaseTX and 100BaseFX.
C. Products shall operate in an environment with an ambient temperature range of –40˚ C to +70˚C and relative humidity between 0% to 95% (non-condensing).
D. The module shall be UL listed.
E. Data Specifications:
   1. Data Interface: Ethernet IEEE802.3.
   2. Data Rate: 10/100 Mbps.
   3. Operation Mode: Full or Half Duplex
F. Shall have the following status indicators as minimum: Power, Fault, and Link.
G. Operate from 12VDC or 24VDC. Provide the required AC to DC power supply for connection to standard 120Vac outlet or terminal connections.
H. Shall be installed within the security camera interface enclosure at each camera location as specified and indicated.

2.05 SECURITY CAMERA INTERFACE ENCLOSURE:

A. Provide a NEMA 4X enclosure for exterior locations and NEMA 12 enclosure for interior locations when required to house the associated media converter and PoE injectors as indicated or required.
B. The enclosure shall include a circuit breaker, surge protective device, and a 120Vac duplex outlet for supplying power to the specified equipment. Any other necessary components for the indicated locations shall be included within the enclosure.
C. Refer to Section 40 67 00 – Process Control Panels and Hardware for applicable component specifications.

2.06 WIRING SYSTEMS:

A. Provide basic wiring materials which comply with Section 26 05 19 – Electrical Power Conductors and Cables and Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
B. Wire and cabling types shall be in accordance with the requirements of the system manufacturer.
C. Provide conduit and wiring, including power and fiber, for fully operational systems.
D. Provide fiber or Ethernet cable to each camera from the required network panels and racks as indicated.
E. Provide surge suppression as required to protect system headend equipment from transients.

2.07 SURGE PROTECTIVE DEVICES:

A. Ethernet Surge Protection:
    1. Provide an Ethernet surge protector for all Category 6 cable connections entering the network rack or outdoor network enclosures from an outdoor mounted camera.
    2. DIN rail mount.
    3. Protection from surges up to 10kV.
    4. Support IEEE 802.3bt up to 95W.
    5. Supports data rates of up to 1Gbps.
    6. Compatible with supplied cameras.
    7. AXIS TU8001 or engineer approved equal.
B. 120Vac Power Surge Protection:
    1. Provide a series rated surge protective device to prevent surges on all dedicated power circuit to the cameras from entering the panelboard supplying power to the cameras.
    2. Surge protective device shall be DIN rail mounted and installed in a NEMA 12 enclosure with hinged cover.
    3. Surge protective devices shall meet the following requirements:
        a. Finger safe screw type terminals.
        b. Three-stage surge protection.
        c. Minimum five year warranty.
        d. Minimum surge current capacity of 4 kA per mode (8/20µs).
        e. Minimum lightning surge current capacity of 2.5 kA per path (10/350µs).
        f. Maximum let thru voltage line to ground 380 Vac.
        g. Maximum let thru voltage line to line of 600 Vac.
        h. Minimum continuous current rating of 15A.
        i. Response time of less than 25 nanoseconds.
    4. Provide surge protective device from one of the following manufacturers:
        a. EDCO.
        b. MCG Surge Protection.
        c. MTL Incorporated.
        d. Phoenix Contact.
        e. Approved-equal.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment.
B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing the security

network switches and servers. Suitable conditions shall be maintained for the remainder of the construction period.

3.02 INSTALLATION:

A. All components shall be installed in accordance with the manufacturer's installation manuals and recognized industry practices.
B. Provide all labor, materials, startup, programming, etc. for a fully functioning system.
C. Mount equipment plumb, level, square, and secure.
D. Mount the security server in the network rack indicated. Mount the client workstation at the location indicated.
E. Power all security system equipment with UPS power circuits indicated.
F. Conduit for perimeter security shall be direct buried, a minimum of 30 inches below grade, and shall be PVC coated RGS or installed within a designated duct bank system as shown on the Contract Drawings. Refer to Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems for raceways and Section 26 05 19 – Electrical Power Conductors and Cables for power and control wiring. For network cables, refer to Section 40 66 00 – Process Control Networks.
G. Install wires and cables without splices, where possible. Make connections and splices at terminal strips in terminal boxes, cabinets or at equipment terminals.

3.03 FIELD QUALITY CONTROL:

A. Manufacturer's Field Services:
   1. The equipment supplier shall provide the field services of a trained technician for the time required to commission, test and start-up all equipment provided.
   2. All travel and living expenses shall be included for all trips to the site. All equipment required for testing, start-up and performance verification shall be provided by the start-up technician.
B. Check all internal and external connections and tighten as required.
C. Perform I/O checkout on all points and verify proper operation.
D. Verify proper connection of communication cabling and proper communication system configuration.
E. Field verify proper operation of all inputs and outputs.
F. Record results of I/O checkout and submit test reports as specified in Division 1.
~~F.~~G. Final camera aiming angles and monitor views shall be approved by Owner prior to final acceptance.

3.04 ADJUSTING AND CLEANING:

A. After field installation and final wiring terminations are completed the video surveillance wiring and cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.
B. Wiring duct covers shall be replaced and secured as required.
C. Prior to final acceptance control panel interior and exterior shall be wiped clean and free from dust and debris.

3.05 TRAINING:

A. Provide a minimum of 2 hours of training at the customer's facility for operations, maintenance, and service personnel.
   1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.

2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, interface, faults, diagnostic tools, troubleshooting, and preventive maintenance.
3. Hands-on training shall be provided on equipment.
4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.

B. Contractor shall make digital video recordings of all on-Site training for Owner's future training purposes. Any charges for this video recording shall be included.

END OF SECTION 28 20 00

SECTION 28 31 00 – ADDRESSABLE FIRE ALARM SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and DIVISION 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. Furnish all labor, materials, and equipment for a fully operational fire alarm system in full compliance with the applicable NFPA standards and all other codes, regulations, and laws applicable to the work, and in full compliance with the intent of the plans and specifications, including all work inferable from same.

B. Section includes:
   1. Fire alarm control unit (FACU).
   2. Initiating devices.
   3. Notification appliances.
   4. Input and output modules.
   5. System accessories.
   6. Wiring and connections.
   7. Raceway.
   8. Supervising station monitoring.
   9. Surge protective devices.
   10. System programming.
   11. System testing.

C. Pay for all necessary construction permits related to the fire alarm system.

D. Related Sections:
   1. SECTION 07 84 13 – PENETRATION FIRESTOPPING.
   2. SECTION 09 90 00 – PROTECTIVE COATINGS.
   3. SECTION 26 05 19 – LOW VOLTAGE POWER CONDUCTORS AND CABLES.
   4. SECTION 26 05 26 – GROUNDING.
   5. SECTION 26 05 33 – RACEWAYS BOXES, SEALS AND FITTINGS.
   6. SECTION 26 05 53 – ELECTRICAL IDENTIFICATION.

1.03 REFERENCES:

A. Applicable Codes and Standards (latest edition or as adopted by local jurisdiction):
   1. 2018 IBC (International Building Code) with State and local amendments.
   2. 2018 IFC (International Fire Code) with State and local amendments.
   3. Local Codes including local policies, interpretation, and standards.
   4. Americans with Disabilities Act (ADA).
   5. FM Global (FM):
      a. FM Approvals - Approval Guide.
      b. Property Loss Prevention Data Sheets.
   6. NFPA (National Fire Protection Association) - Latest edition or as adopted by local jurisdiction:
      a. NFPA 70 – National Electrical Code (NEC) (2017).
      b. NFPA 72 – National Fire Alarm and Signaling Code (2016, 2019 for submittal requirements only).
      c. NFPA 170 – Standard for Fire Safety and Emergency Symbols (2018)

d. NFPA 820 – Standard for Fire Protection in Wastewater Treatment and Collection Facilities (2020).

7. Underwriters Laboratories (UL): Comply with provisions of UL safety standards pertaining to fire alarm systems; provide products and components which are UL-listed and labeled.
   a. Fire Protection equipment directory.

1.04 DEFINITIONS:

A. References to the Fire Protection Engineer in this SECTION shall mean one of the following:
   1. A registered professional engineer (P.E.), experienced in the design of fire alarm systems and registered in the project State, who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveys (NCEES) and has relevant fire protection experience.
   2. A registered P.E., registered in the project State, experienced in the design of fire alarm systems and all other facets of fire protection and life safety for at least three projects with the same type of facility and system(s) as utilized in the project, including responsibility for fire suppression, life safety (including building code analysis) and fire alarm systems.
   3. A registered P.E. in a related engineering discipline, experienced in the design of fire alarm systems and registered in the project State, with a minimum of 5 years of experience, dedicated to fire protection engineering that can be verified with documentation.

B. References to the Fire Alarm Technician in this SECTION shall mean:
   1. A qualified fire protection technician certified at Level III with the National Institute for Certification in Engineering Technologies (NICET) in Fire Alarm Systems.

C. References to the Fire Alarm Installer in this SECTION shall mean:
   1. A qualified fire protection technician certified at Level II with the National Institute for Certification in Engineering Technologies (NICET) in Fire Alarm Systems.

D. References to the Manufacturer's Authorized Representative in this SECTION shall mean:
   1. A qualified fire protection technician certified at Level III with the National Institute for Certification in Engineering Technologies (NICET) in Fire Alarm Systems, trained, experienced, and authorized by the fire alarm equipment manufacturer on the installation, programming, testing, and operation of their equipment.

E. References to the Fire Alarm Control Unit in this section shall mean:
   1. A control unit performing the ~~combined~~ functions of ~~both~~ a fire alarm control unit ~~and autonomous control unit~~.

1.05 PERFORMANCE REQUIREMENTS:

A. The system shall be a complete, supervised, noncoded, analog/addressable, protected-premises fire alarm system.

B. Provide fire alarm system suitable for type of occupancy as defined by the locally adopted building code and as approved by local authority having jurisdiction (AHJ).

C. Provide occupant notification using audible horns and visible strobes with occupant notification conforming to NFPA 72.

D. Fire alarm system design shall be approved by the Engineer and authorities having jurisdiction.

1.06 ACTION SUBMITTALS:

A. Refer to DIVISION 01 for administrative and procedural requirements for submittals.

B. Shop Drawings: Prepare working plans, product data sheets, and calculations for the complete fire alarm system in accordance with the documentation requirements of NFPA 72, 2019 Edition.
   1. Employ the services of a Fire Alarm Technician and Fire Protection Engineer. The Fire Alarm Technician shall prepare the fire alarm system shop drawings and calculations for submittal. The Fire Protection Engineer shall directly oversee the design and sign and seal the shop drawings and calculations for submittal.

C. Shop drawing submittals shall include, but not be limited to, the following:
   1. Name of protected premises, owner, and occupant (where applicable).
   2. Name of installer or contractor.
   3. Location of protected premises.
   4. Device legend in accordance with NFPA 170.
   5. Date of issue and any revisions.
   6. Scaled floor plan drawings (minimum scale of 1/8" = 1'-0") which include:
      a. Floor identification
      b. Point of compass
      c. Graphic scale
      d. All walls and doors
      e. All partitions extending to within 10 percent of the ceiling height
      f. Room and area descriptions
      g. Equipment, device, component, and appliance locations
      h. Settings of notification appliances (candela or wattage)
      i. Temperature rating of heat detectors
      j. Locations of monitor/control interfaces to other systems
      k. Unique address or identifier on each device and appliance
      l. Locations of fire alarm primary power disconnecting means
      m. System riser locations
      n. Type and number of fire alarm system components, devices, and appliances on each circuit, on each floor level
      o. Type and quantity of conductors and conduit (if used) for each circuit
         (1) Indicate wire and cable routing
         (2) Conduit and circuit routing
         (3) Number of wires or cables in each conduit or pathway
         (4) Conduit sizes
         (5) Unique identifier for each circuit.
      p. Identification of any ceiling over 10 ft in height where automatic detection will be installed
      q. Types of construction and details of ceiling geometries, including beams and solid joists, where automatic detection will be installed
      r. Location of all supply and return air diffusers (where automatic detection is used)
   7. System riser diagrams, coordinated with the floor plans, which include:
      a. General arrangement of the system in building cross-section
      b. Number of risers
      c. Type and number of circuits in each riser
      d. Type and number of system components, devices, and appliances on each circuit, on each floor or level shown in the order of connection
      e. Settings of notification appliances (candela or wattage)

f. Unique address or identifier on each device and appliance
g. Number of conductors for each circuit
h. Point-to-point field wiring diagrams (riser diagram) of the entire fire alarm system showing all equipment, devices, appliances, and circuits
i. Show devices and appliances in the correct order
j. Show location of all tee taps where permitted
k. Each circuit shall be provided with unique identifier

8. Control unit/equipment wiring diagrams for all equipment listed as a control unit, control unit accessory, power supply, or battery charger.
   a. All field wiring terminals with terminal identification
   b. Indicate and label all connected circuits
   c. Include unique identification of the control equipment
   d. Field connections to supervising station signaling equipment
   e. Field connections to fire safety control interfaces
9. Typical wiring details devices and appliances
10. Sequence of operations matrix
11. Interface of fire safety functions
12. Provide fire stopping details for penetration through fire and smoke walls, barriers, and partitions. Include UL System numbers for each detail.
13. Submit graphic display plan.

D. Calculations
   1. Battery calculations
   2. Voltage drop calculations

E. Product data sheets
   1. Provide product data sheets for all equipment, devices, appliances, etc. used.
      a. Outdated or poorly reproduced cut sheets will not be accepted.
   2. Product data sheets shall be annotated to indicate the exact model, configuration, finishes, and other options that will be provided.
      a. Cut sheets with multiple models, configurations and options that are not annotated will not be accepted.
   3. Submit power requirements for all equipment, devices, and appliances.
   4. Provide product data sheets for each cable and conductor type used.
   5. Information on termination types and raceway to be used.

F. The shop drawings, including resubmittals, shall be submitted as a complete submittal package including, but not limited to, shop drawings/working plans, annotated product data sheets, and calculations. Partial submittals and submittals not fully complying with the requirements and recommended practices of NFPA 72-2019 and this specification will be returned disapproved without review.

G. Shop drawings shall be wholly generated and coordinated by the Fire Alarm Contractor. Partial or complete reproductions of the Engineer's drawings will not be accepted.

H. Shop drawing resubmittals shall be accompanied by a response letter addressing each comment in the Engineer's review of the shop drawings. Changes to the working plans shall be clouded to indicate the revised area and annotated to indicate the revision number and revision date.

I. Submit shop drawings, cut sheets, and calculations to the AHJ for review.

J. Submit shop drawings, cut sheets, and calculations to the Owner's Insurance underwriter for review, if applicable.

K. Submit shop drawings, cut sheets, and calculations as specified in DIVISION 01 SUBMITTALS to the Engineer for review.
L. Submit a fire alarm system acceptance test procedure detailing the procedures to be followed for testing of the control equipment, remote monitoring, wiring systems, devices, accessories and notification appliances. Identify each piece of control equipment, device, appliance and circuit to be tested. Describe the test procedure for each item. Identify all equipment and personnel required for the testing.
    1. Test procedures are to be written to minimally disrupt facility operations (minimize activation of evacuation notification appliances, AHU shutdown, etc.) in support of testing requirements.
M. Obtain all approvals prior to purchasing equipment or beginning installation.
N. The Fire Alarm Contractor assumes sole responsibility for purchasing equipment or beginning installation before all approvals are obtained. No change orders will be awarded due to purchasing equipment or beginning installation prior to obtaining approvals.

1.07 INFORMATION SUBMITTALS:
A. Contractor qualifications: The Fire Alarm Contractor shall be a qualified fire alarm contractor, licensed and regularly engaged in the installation of fire alarm systems of similar size and complexity.
    1. Submit contractor qualifications and license information.
B. Designer qualifications:
    1. Submit qualifications of Fire Protection Engineer.
    2. Submit qualifications of Fire Alarm Technician.
    3. Submit qualifications of Fire Alarm Installer.
    4. Submit qualifications of Manufacturer's Authorized Representative.

1.08 CLOSEOUT SUBMITTALS:
A. Submit operations and maintenance manuals in accordance with DIVISION 01. In addition to items specified in DIVISION 01, provide documentation in accordance with the documentation requirements of NFPA 72. Include as-built drawings, product data sheets, calculations, and a copy of the site-specific software.
B. Submit all field test data per NFPA 72 and specifications.
    1. Submit NFPA 72 System Record of Completion and applicable Supplementary Records of Completion.
    2. Submit NFPA 72 System Record of Inspection and Testing and applicable Supplementary Records of Inspection and Testing.
C. Submit complete warranty information.

1.09 QUALITY ASSURANCE:
A. Design and install fire alarm systems in accordance with the applicable NFPA standards, locally adopted building code, fire code, and other local policies, interpretations and standards as listed in Part 1 References.
    1. If there is a conflict between the reference codes or standards and this SECTION, it is the Contractor's responsibility to notify the Engineer in writing. The most stringent requirement, as determined by the Engineer shall apply.
B. Compliance with referenced NFPA standards is mandatory. This includes advisory provisions listed in the appendices of such standards, as though the word "shall" had been substituted for the word "should" wherever it appears.

C. Installer Qualifications:
   1. The Contractor for the fire alarm installation shall be a qualified fire alarm contractor, regularly engaged in the installation of fire alarm systems ~~for a minimum of 5 years~~ with required state and local licenses.
   2. A licensed electrician shall be permitted to install conduit, cabling, backboxes and wire.
   3. The Contractor's responsibilities include designing, fabricating, installing and programming the fire alarm system, and providing professional design and engineering services needed to assume engineering responsibility.
      a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports shall be by a qualified Fire Alarm Technician.
      b. The Contractor shall maintain a qualified Fire Alarm Installer on-site during installation.
      c. The Contractor shall maintain a qualified Manufacturer's Authorized Representative on-site during preliminary and final testing.
      d. The Manufacturer's Authorized Representative shall supervise the installation, programming, preliminary testing, and final testing. The Manufacturer's Authorized Representative shall provide the required instruction to the Owner's personnel in the system operation, maintenance, and programming.

PART 2 - PRODUCTS

2.01 GENERAL:
A. All equipment shall be Listed by Underwriter's Laboratories and included in the latest edition of the U.L. Fire Protection Equipment directory or Approved by FM Global and listed in the FM Approvals - Approval Guide.
B. All components provided shall be listed for use with the selected system.
C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.02 MANUFACTURERS:
A. Fire alarm system control equipment, devices, appliances, components, and accessories may be provided by any manufacturer who can meet this specification.

2.03 FIRE ALARM AND DETECTION SYSTEMS:
A. General: Provide a complete analog/addressable fire alarm system and products of types, sizes, and capacities indicated, which comply with manufacturer's standard design, materials, components; constructed in accordance with published product information and as required for complete installation. Provide fire alarm and detection systems for applications indicated.
B. The fire alarm system shall provide operation of detection devices, alarm notification, local annunciation, and auxiliary control functions.
C. System Wiring and Supervision:
   1. Provide Class B initiating device circuits (IDC).
   2. Provide Class B notification appliance circuits (NAC).
   3. Provide Class B signaling line circuit (SLC).
   4. Provide circuits with a minimum Pathway Survivability Level 0.
D. Power Supplies: Provide system for operation on 120VAC power supply from the building electrical system. Fire alarm systems shall be power limited, operating on 24 VDC.

1. Provide battery back-up as secondary power supply. Provide back-up battery and battery charger each with 20% spare capacity for future use. Design battery back-up to take over supply to system instantaneously. Provide battery with adequate capacity to be capable of operation of system for:
   a. 24 hours under normal supervisory (nonalarm) conditions and then for 5 minutes under alarm conditions.
2. Battery capacity requirement shall be met regardless of whether an emergency power generator is provided as part of the project.
3. The battery charger shall completely recharge batteries within 48 hours.

E. Spare circuit capacity:
1. Do not load notification appliance circuits (horn/strobe) beyond 80 percent of capacity.
2. Provide a minimum of 25 spare device addresses.

F. Required System Features:
1. Refer to the functional matrix on the drawings.
1. Alarm initiation from heat detectors, linear heat detection, and manual pull stations.
2. Supervisory indication from duct smoke detectors.
3. Fan shut down relays.
4. Occupant notification with audible and visible occupant notification appliances.

G. Wiring System Materials: Provide basic wiring materials which comply with SECTION 26 05 33 – RACEWAYS, BOXES, SEALS, AND FITTINGS FOR ELECTRICAL SYSTEMS.
1. Provide wire and cable in accordance with requirements of NFPA 70 and the FACU manufacturer.
2. Provide conductors which are listed and approved for fire alarm usage.
3. Conductors shall be solid except those used in circuits requiring shielding.
4. Minimum SLC conductor size shall be 18 AWG.
5. Minimum IDC conductor size shall be 18 AWG.
6. Minimum NAC conductor size shall be 16 AWG.
7. Provide shielded conductors for SLC's where recommended by the manufacturer or otherwise required due to other building systems or construction. Communications issue resulting from interference will be considered a deficient installation to be corrected at no additional cost.
8. Provide shielded conductors for SLC's.
9. Conduit shall be electrical metallic tubing (EMT) or rigid metal conduit (RMC).
   a. Minimum conduit size shall be ¾ inch.
   b. All conduit shall be factory finished or field painted red.
10. Fittings and seals shall be metallic suitable for use with the conduit type.
11. Terminal Boxes, Junction Boxes, and Covers: Provide fire alarm terminal boxes, junction boxes, and covers prefinished red or painted with red enamel. Label boxes as required by the AHJ and specifications.

H. Fire Alarm Control Equipment (FACU panel):
1. Provide FACU enclosures for housing devices and circuits necessary to perform required functions. Control panels shall comply with UL 864.
2. Provide control panel for operation on 120VAC supply and for 24VDC (power limited) system operation with integral battery standby power source.

3. Provide a fire alarm communicator (FAC) to transmit signal to supervising station. The FAC shall have selectable reporting paths to include cellular only, IP only, or IP primary/cellular backup. Provide with 24-hour battery backup.
4. A fire alarm signal shall activate notification appliances throughout the building. Audible appliances shall produce a three-pulse temporal pattern in accordance with NFPA 72. Visible appliances shall operate in accordance with NFPA 72.
5. Panels must be capable of fiber networking.
6. FACU shall have an RS 232 port.
7. FACU shall include dry output contacts, rated 24VDC, for the following status points:
   a. Alarm.
   b. Trouble.
   c. Supervisory.
8. Enclosure: NEMA ICS 6, Type 1, enameled-steel, cabinet.
   a. Mounting: Surface.

I. Initiating Devices
1. All initiating devices shall be intelligent, addressable devices except where specifically noted otherwise.
2. Addressable Manual Fire Alarm Pull Stations: Provide manufacturer's standard construction, red enclosure, manual fire alarm pull station with the following features.
   a. Surface mounted in unfinished areas.
   b. Outdoor units and units located in wet indoor locations shall be weatherproof.
   c. Addressable.
   d. Non-break glass operation.
   e. Double action.
   f. Key operated to reset.
      (1) Reset key must be the same as the FACU key.
3. Addressable Automatic Heat Detectors shall comply with UL 521:
   a. Addressable Combination 15°F per minute rate of rise and 200°F fixed temperature spot type, 24VDC restorable.
4. Linear Heat Detection:
   a. Shall consist of an approved Digital Linear Heat Detector.
   b. The Linear Heat Detection System's spacing and/or proximity locations shall be determined by applicable NFPA, State Codes, Local Codes, International Codes and/or the manufacturer's recommendations.
   c. Performance Requirements:
      (1) Shall be rated for up to 5~~3~~0-foot spacing and/or proximity detection.
      (2) Shall be compatible with any listed or approved fire alarm panel.
      (3) Shall detect an overheat or fire at its rated temperature.
      (4) Shall report any equipment related fault through a fault output relay.
      (5) Shall be installed to comply with NFPA standards (and the authority having jurisdiction and/or the manufacturers recommendations).
   d. Basis of Design: Protectowire PHSC-XCR 200 degree wire with PIM-530E Interface Module. Listed alternate equal and approved products will be considered.
5. Automatic Smoke Detectors: Provide manufacturer's standard construction automatic smoke detectors of the following types.
   a. Addressable In-duct photoelectric type, 24VDC, with integral and remote test-reset-off keyed switch and remote LED alarm light. Provide sampling tubes of design

and dimension as recommended by the manufacturer for the specific duct size where it is applied. Detector shall comply with UL 268A. Provide integral fan shutdown relay. A trouble signal shall occur when the cover is removed.

J. Notification Appliances
   1. Unless otherwise noted, provide notification appliance with the following color and lettering:
      a. Red base and grill lettered "FIRE" in 1-inch high, white letters in unfinished areas.
   2. Horns: Provide manufacturer's standard construction, 24VDC, fire alarm horn with following features.
      a. Coded
      b. Surface mounted (with grille) in unfinished areas and outdoors. (Outdoor units shall be weatherproof).
      c. Electronic Tone. Electromechanical designs are not acceptable.
   3. Visible Alarm Strobes: Strobe shall comply with UL 1971 except as noted otherwise. Provide manufacturer's standard construction alarm lights with the following features.
      a. Clear lens.
      b. 24VDC Xenon or LED strobe.
      c. Flash intensity, rate and duration shall comply with NFPA 72.

K. System Accessories
   1. Addressable Input Modules (AIMs):
      a. Same manufacture as the FACU.
      b. Input modules shall include an LED that changes states to indicate an alarm or supervisory condition. Module LED's shall be visible without removal of covers.
      c. Monitor modules with multiple addresses and a single LED indicator are not acceptable. Multi-address modules with LED indicators for each input and address are acceptable when mounted in cabinet with all LED's visible without removing cover.
   2. Addressable Output Modules (AOMs):
      a. Same manufacture as the FACU.
      b. Output modules shall include an LED that changes states to indicate an activated condition. Module LED's shall be visible without removal of covers.
      c. Modules with multiple addresses and a single LED indicator are not acceptable. Multi-address modules with LED indicators for each output and address are acceptable when mounted in cabinet with all LED's visible without removing cover.
   3. Surge Protective Devices:
      a. Transient Voltage Surge Suppressors (TVSS) for use on AC power to FACU.
         (1) Series Connected
         (2) UL 1449 4th Edition, UL 1283

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Examine areas and conditions under which fire alarm systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

3.02 DELIVERY, STORAGE, AND HANDLING:

A. Handle fire alarm equipment carefully to prevent damage, breaking, and scoring. Do not install damaged equipment or components; replace with new.

B. Store fire alarm equipment in a clean, dry place. Protect from weather, dirt, fumes, water, construction debris, and physical damage.

3.03 GENERAL:

A. Provide a complete and fully operational fire alarm system as described herein and as shown on the drawings.

B. Equipment shall be installed and wired in accordance with this specification, project drawings and approved shop drawings.

C. Provide all new wiring, conduit, junction boxes and outlet boxes required for the system, including connections to initiating, indicating and control devices furnished by others.

D. The Fire Alarm Installer shall oversee the fire alarm installation and shall be on site during all fire alarm system work.

3.04 INSTALLATION OF BASIC WIRING SYSTEM MATERIALS:

A. Install wiring, raceways, and electrical boxes and fittings in accordance with SECTION 26 05 33 – RACEWAYS, BOXES, SEALS, AND FITTINGS FOR ELECTRICAL SYSTEMS and NFPA 70.

B. Install all wiring in conduit or raceways.

C. Support conduit in accordance with the NEC and Division 26.

1. Tension only hangers are not permitted (for example, batwings).
2. Flexible conduit is permitted only where connecting to devices and appliances located in removable ceiling tiles; and where specifically indicated on the drawings.

D. Conceal conduit in walls or above ceilings unless otherwise indicated. Conduit may be surface mounted in unfinished areas (example: mechanical and electrical equipment rooms).

E. Route conduit to devices and appliances not mounted directly on walls or ceilings as a single pendent drop to each device or appliance from the ceiling surface above. Do not trapeze conduit across an open space.

F. Do not use fire alarm equipment as a raceway for routing power or low voltage wiring. Only wiring terminating within the equipment enclosure may be run into the enclosure.

G. Where possible, install wires and cables without splices. Make connections and splices at terminal strips in terminal boxes, cabinets or at equipment terminals.

H. Ground one end of shielding on circuits with shielded conductors.

I. All fire alarm devices within 10 feet of open drain connections shall be in NEMA 4 boxes with waterproof raceway.

J. Firestop all penetrations through smoke and fire barriers.

3.05 INSTALLATION OF FIRE ALARM SYSTEMS:

A. Install fire alarm system as indicated, in accordance with equipment manufacturer's written instructions and complying with applicable portions of the NEC.

B. Manual Pull Stations:

1. Install fire alarm manual pull stations as indicated on the drawings.

C. Heat detectors:

1. Install heat detectors in accordance with NFPA 72 and as indicated on the drawings.
2. Space heat detectors in accordance with NFPA72 and as indicated on the drawings.

3. Spacing of heat detectors shall be adjusted in accordance with NFPA 72 requirements for ceiling height and construction type.
4. Install test switches for linear heat detection in an accessible location.

D. Addressable Modules
1. Install modules in backbox or manufacturer provided enclosure with LED visible without cover removal.

E. Duct Smoke Detectors:
1. Duct mounted smoke detectors shall be installed in the ductwork between six and ten duct equivalent diameters of straight, uninterrupted ductwork from a bend or opening. Coordinate installation with Division 23 Contractor.
2. Coordinate with Division 23 Contractor and make connection from duct detector or output module to air handling equipment shutdown contacts.

F. Alarm Notification Appliances:
1. Install notification appliances as indicated on the drawings, spaced in accordance with NFPA 72.
2. Install wall mounted audible alarms not less than 90 inches above finished floor nor less than 6 inches below ceiling.
3. Install wall mounted visible alarm strobes with the entire lens between 80 and 96 inches above finished floor.
4. Mount appliances at uniform heights.
5. Appliances may be surface mounted in unfinished areas. Surface installation shall be with a factory provided back box. The aesthetic appearance shall not have any mounting holes or screw heads visible when the installation is completed.
6. Outdoor notification appliances shall be NEMA 4X, IP56 rated and shall be installed with suitable weatherproof back box, seals and gaskets.

G. Wiring: Wiring of fire alarm system is work of this Section but is not specifically detailed on drawings.
1. Complete wiring in accordance with the NEC and the manufacturer's requirements.
2. Consistently color code wiring throughout the system and install per manufacturer's point-to-point wiring diagram.
3. Determine exact number of wires required for each device, appliance, and circuit. Connect each device or appliance with sufficient wiring to complete its intended operation.
4. Size all raceway per the NEC. Minimum sizes shall be as specified in this SECTION.
5. All fire alarm circuits shall be supervised. Provide end-of-line resistors where required to supervise conventional device circuits, power circuits, releasing circuits, etc. This includes the wiring between fire alarm devices and auxiliary devices such as air handling units.
6. Install devices and appliances using power supplies, circuits and wire sizes to alleviate voltage drops which would make devices operate below the voltage limits for which they are designed. Calculate voltage drops before wire and equipment is installed.
   a. Perform voltage drop calculations for notification appliance circuits using the following criteria
      (1) Starting voltage shall be 20.4 VDC.
      (2) The current shall be the maximum current draw listed in the manufacturer’s literature (UL Max current draw at 16 VDC) for the selected candela rating and sound output setting.

(3) The wire resistance shall be the resistance for single strand, uncoated, copper conductors in Table 8 of the NEC unless the product data sheet for the conductor included in the product data submittal indicates a different value. The wire resistance shall be adjusted to account for the maximum ambient temperature anticipated.

(4) The minimum voltage at each notification appliance shall be 16 VDC at all notification appliances.

7. Install surge suppressors on all 120 VAC power supplies to fire alarm equipment and on fire alarm circuits entering or leaving the building. Ground surge protection devices in accordance with the manufacturer's recommendations.
8. Identify all conductors with permanent markings at each device and panel.

H. Emergency Control Functions and Interfaces:
1. Provide all modules, wiring, and make final connections to equipment interfaced, controlled, or monitored by the fire alarm system. Provide modules and supervised power for interface with mechanical air handling units and dampers for automatic control of HVAC systems, and other systems as indicated on the drawings.
2. Connections to other systems shall be made by the suppliers of those systems.
3. Install modules a maximum of 3 feet from the controlled or monitored circuit or device. All relay contacts shall be Form C to permit interface with normally open and normally closed circuits. Install all relays in properly sized equipment enclosures.
4. Coordinate with Division 23 for location and quantity of air handling units requiring duct smoke detectors. Provide, install, and wire detector for shutdown of air handling equipment.

I. Programming: Final system software configuration shall be verified in the field by the system supplier coordinating with the Engineer and the Owner. The system shall include all programming required to provide a proper functioning system as described herein.
1. Program the system to function properly and according to the operational matrix indicated on the drawings.

3.06 INSTALLATION OF BASIC IDENTIFICATION:

A. Install electrical identification in accordance with SECTION 26 05 53 - ELECTRICAL IDENTIFICATION and this SECTION.

B. All junction, terminal, and pulling box covers shall be factory finished or painted red and shall be identified in a permanent and legible manner to indicate the zone and circuit that it contains.
1. Label the inside cover of the box.
2. Hand lettering is not acceptable.

C. Label all system controls and equipment including remote power supplies, amplifiers, and fire alarm communicators.
1. Labels shall be permanent red phenolic labels with engraved white letters.
2. Labels shall match fire alarm as-built drawings.

D. All detection and terminal devices shall be identified in a permanent and legible manner to indicate the device zone and address keyed to the posted operations and maintenance instructions.
1. Hand lettering is not acceptable.
2. Use labels such as:
a. HD## (heat detector)
b. DSD## (duct smoke detector)
c. MM## (monitor module)

d. CM## (control module)
e. RM## (relay module)

E. All notification appliances shall be identified in a permanent and legible manner to indicate the device number keyed to the posted operations and maintenance instructions.
1. Hand lettering is not acceptable.
2. Use labels such as:
a. HS## (horn/strobe)
b. H## (horn)
c. S# (strobe)

F. All wiring shall be labeled at each termination and in each junction or pulling box.
1. SLC wiring shall be labeled using the following format:
a. Input (from previous device on SLC): "SLC from SD##" or "SLC from FACU"
b. Output (to next device on SLC): "SLC to SD##" or "SLC to FACU"
2. NAC wiring shall be labeled using the following format:
a. Input (from previous device on NAC): "NAC from HS##", "NAC from RPS#"
b. Output (to next device on NAC): "NAC to HS##" or "NAC to RPS#"

G. Label each fire alarm control unit, power supply, and other equipment provided with 120VAC power with the panel location, number and circuit number powering the equipment.

H. Label batteries with the date of installation.

3.07 FIELD QUALITY CONTROL AND TESTING:

A. Connection and Supervision: Make connections to panel and perform all testing under the supervision of the Fire Alarm Technician.

B. Protect fire alarm devices during construction. Replace any unprotected smoke detectors.

C. All wiring shall test free from open conductors, shorts and/or crosses between conductors, and grounded conductors.

3.08 TESTING:

A. The Manufacturer's Authorized Representative shall perform all testing.

B. Participate in pre-testing between subcontractors for all building systems with interface with the building fire alarm system.

C. Provide all materials, equipment, and labor for testing.
1. This includes specialized equipment such as manometers.

D. System Test and Approval:
1. Prior to final acceptance of system, the Manufacturer's Authorized Representative shall test the system per NFPA 72 requirements. Test each manual, automatic, sensing, detecting, and alarm device.
a. Test each circuit for open circuits, shorts, grounds, and loop resistance. Record test results of each circuit test and include in close-out submittals.
b. All resettable smoke detection devices shall be tested with "canned smoke."
c. Duct smoke detector testing shall include verifying pressure differential with a manometer or as recommended by the manufacturer.
d. All resettable thermal sensors shall be tested with heat, and non-resettable thermal sensors shall be tested by short-circuiting each end-of-line device's contacts.
e. Test all HVAC, exhaust fan, interfaces for proper operation.
f. Correct any deficiencies prior to final acceptance testing. Submit written notification to the Engineer that the system has been pre-tested and all deficiencies have been corrected.

2. In presence of the Authority Having Jurisdiction, Owner's Representative, and Engineer's representative, the Manufacturer's Authorized Representative shall perform acceptance testing in accordance with NFPA 72. Test each manual, automatic, sensing, detecting, and alarm device, notification appliance, emergency function, and equipment interface in accordance with NFPA 72.
3. After being signed by the Authority Having Jurisdiction, submit a copy of test results to the Engineer, Owner, and Owner's insurance carrier, and the Authority Having Jurisdiction. Provide a copy of the inspection record at the fire alarm control panel.
4. The Manufacturer's Authorized Representative shall provide up to 4 hours of on-site training of the Owner's personnel on procedures related to start-up, shutdown, operation, troubleshooting, servicing, adjusting and preventative maintenance for the system. Provide Owner with 10 days advance notice of training. Coordinate training with Division 23 and Division 26.

3.09 MAINTENANCE:

A. The equipment supplier shall maintain a local service organization which is available to perform testing, inspection, repair, and maintenance service on the system.

3.10 SPARE PARTS:

A. Provide a list of manufacturer-recommended spare parts and accessories for maintenance of the system. Including recommended quantities and unit prices.
B. Provide spare parts for the fire alarm system.
   1. General: All spare parts shall be directly interchangeable with the corresponding components of the installed systems.
   2. All spare parts shall be suitably packaged and identified by nameplate, stamping, or tagging.
   3. The following spare parts and accessories shall be included:
      a. Provide 1 spare spot-type heat detector.
      ~~a.~~b. Provide linear heat detection parts and accessories as recommended by manufacturer.
      ~~b.~~c. Provide 1 spare audible/visual notification appliance.
   4. Furnish a list of all other spare parts and accessories which the manufacturer recommends to be stocked for maintenance of the system.
C. Keys and locks for all equipment shall be identical. Keys shall be identified by an appropriate number stamped on the key or on a metal tag attached thereto. If required, a key numbering chart shall be provided in each operations and maintenance manual furnished.
   1. Not less than 6 keys for each type required shall be provided.

END OF SECTION 28 31 00

SECTION 31 11 00 – CLEARING AND GRUBBING

PART 1 - GENERAL

1.01 SUMMARY

A. Clearing and grubbing, within the Site and as indicated in the Contract Documents, shall consist of the removal and disposal of all trees, stumps, roots, logs, shrubs, grass, weeds, fallen timber, trash (surface and buried), buildings, foundations, fences and all other material designated for removal and disposal.

1.02 SPECIFICATION MODIFICATIONS

A. It is understood that throughout this section these Specifications may be modified by appropriate items indicated in the Contract Documents.

1.03 RELATED SECTIONS

A. Section 02 41 00 – Demolition.
B. Section 31 20 50– Site Preparation and Earthwork.

1.04 DEFINITIONS

A. Clearing – The removal and disposal of all materials such as trees, brush, fallen timber and other materials found on or above the surface of the site. It shall include, but is not limited to, the removal of the following: buildings, fences, lumber, trash and other waste. Salvaging and disposing of the materials shall be as specified in this section and in the Contract Documents.
B. Stripping – The removal and disposal of material such as: sod, grass, weeds, agricultural crops, bushes, brush and all decayed vegetative matter from the surface of the ground without disturbing the earth more than is necessary.
C. Grubbing – The removal and disposal of all material such as stumps, roots, buried debris, foundations and trash encountered below the surface of the ground that has not been included in the description of clearing.
D. Trees – Woody growth having a diameter of 2 inches or greater as measured 4.5 feet above the ground.
E. Brush – Dense vegetation consisting of shrubs, bushes and small trees less than 2 inches in diameter as measured 4.5 feet above the ground.

1.05 SUBMITTALS

A. All permits required for the Work specified in this section.
B. Landfill Information: The Contractor shall submit for review and approval all proposed landfill sites to be used for the disposal of debris resulting from clearing and grubbing.

1.06 QUALITY ASSURANCE

A. The Contractor is responsible for the quality assurance and quality control of the Work.

1.07 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Salvaged materials shall be handled, stored and delivered as specified in the plan.

1.08 LIMITS OF WORK

A. The limits of clearing and grubbing area shall extend according to the Drawing unless otherwise follow APWA 2100 Specification, Section - 2101.4.
B. Large projects shall be cleared and grubbed as construction progresses. Mass clearing and grubbing shall be avoided.
C. An undisturbed strip of not less than 25 feet in width consisting of existing grass or other vegetation shall be kept in place around the perimeter of the construction site and protected from damage. The Contractor shall strip only those areas necessary for the construction of the
project.

PART 2 – PRODUCTS - Not Applicable

PART 3 – EXECUTION

3.01 PERIMETER EROSION AND SEDIMENT CONTROLS

A. Perimeter erosion and sediment controls as shown in the drawing shall be installed prior to the start of clearing and grubbing the Site.
B. When needed for the installation of perimeter controls, limited clearing and grubbing will be allowed to accommodate the Contractor's perimeter installation operation.

3.02 PRESERVATION OF TREES

A. No trees shall be removed outside the excavated area or outside filled areas, unless their removal is indicated on the Drawings or as authorized by the Owner.
B. Trees left standing shall be protected from permanent damage by construction.

3.03 CLEARING

A. Trees located within the permanent easement and temporary construction easement shall be removed as indicated on the Drawings.
B. Clearing shall consist of removing all materials such as trees, brush, downed timber, trash, waste and other objectionable materials found on or above the surface of the site. The Contractor shall tag or identify existing trees, shrubs and landscape materials to be removed; and obtain approval prior to removal.

3.04 STRIPPING

A. Stripping and stockpiling shall include the removal and disposal of material such as: sod, grass, weeds, agricultural crops, bushes, brush and all decayed vegetative matter from the 4-6 inch of topsoil of the ground without disturbing the earth more than is necessary and placing when completed.

3.05 GRUBBING

A. Grubbing shall consist of the removal and disposal of all material such as stumps, roots, buried debris, foundations and trash encountered below the surface of the ground that has not been included in the description of clearing.
B. The vegetative matter shall be removed to the following depths:
    1. A minimum depth of 12 inches below ground line or subgrade, whichever is lower.
    2. A minimum depth of 18 inches below ground line or subgrade, whichever is lower, at water containment areas (berms, dams, levees, lagoons, ponds, dikes etc.).
C. Remove and dispose of all stumps, roots and other vegetative matter larger than 2 inches in diameter.
D. When materials encountered below grade that are detrimental to the proposed improvement, the material shall be removed to a depth necessary to provide adequate space for installation and support for the proposed improvement.

3.06 EMBANKMENT AREAS

A. Unless otherwise noted on the plans, where undisturbed stumps and roots are encountered and the fill depth will exceed 3 feet, the stumps and roots may be left in place provided they do not extend above final grade.

3.07 BORROW AREAS

A. All stumps, roots and other objectionable matter shall be removed from the borrow material used for embankment or fill. The borrow area shall be left in a well-drained and smooth condition and restored.

3.08 BACKFILL

A. Backfill all holes, pits and depressions resulting from clearing and grubbing.
B. Backfill with suitable material and grade the area to drain. shall place and compacted in conformance with Section 31 20 50 – Site Preparation and Earthwork.

3.09 DISPOSAL OF MATERIAL

A. Dispose of all materials from the clearing and grubbing operations at a approved location, as arranged for by Contractor, at no additional cost to the Owner.
    1. Unless otherwise specified in Specific Project Requirement or portions of the Contract Documents, the Contractor may claim and salvage any material which the Contractor may consider of value but shall not delay any work associated with the Contract by the salvaging operations. Contractor may consider of value but shall not delay any work associated with the Contract by the salvaging operations.
B. Open burning of brush or debris on the Site is not allowed.

END OF SECTION 31 11 00

SECTION 31 20 50 – SITE PREPARATION AND EARTHWORK

PART 1 – GENERAL

1.01 SUMMARY

A. This section covers earthwork and grading associated with general excavation, backfill and compaction required for the Work.

B. This section also covers the handling, storage, transportation and disposal of all excavated material; sheeting and shoring, subgrade preparation, dewatering as necessary or required, protection of adjacent property, construction of fills and embankments, surfacing and grading; and other appurtenant work.

1.02 SPECIFICATION MODIFICATIONS

A. It is understood that throughout this section these Specifications may be modified by appropriate items indicated on the Contract Drawings.

1.03 RELATED SECTIONS

A. Section 31 11 00 - Clearing and Grubbing

B. Section 31 23 33 – Trenching and Backfilling for Open-Cut Construction

C. Section 02 41 00 - Demolition

1.04 CODES AND STANDARDS

A. The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

B. American Society for Testing and Materials (ASTM):

1. ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soils Using Standard Effort (12,400 ftlb/ft3).
2. ASTM D1556 - Standard Test Method for Density and Unit Weight of Soil in Place by Sand-Cone Method.
3. ASTM D2167 - Standard Test Method for Density and Unit Weight of Soil in Place by the Rubber Balloon Method.
4. ASTM D4318 - Standard Test Methods for Liquid Limit, Plastic Limit and Plasticity Index of Soils.
5. ASTM D4546 - Standard Test Method for One-Dimensional Swell or Collapse of Soils.
6. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).

C. City of Kansas City, Missouri Department of Public Works, Construction and Material Specifications (http://kcmo.gov/publicworks/design-construction-standards/) KCMO PW 2202, Subsection 2202, Untreated Compacted Aggregate.

D. Missouri Department of Transportation, Missouri Standard Specifications for Highway Construction, Division 1000, Materials Details.

1.05 DEFINITIONS

A. Paved Areas – Areas for which the final surfacing will be street pavement, shoulders, driveways, parking lots, curbs, gutters, sidewalks, or other surface features.
B. Unpaved Areas – Areas for which the final surfacing will be in a green space.
C. Gravel Area- Areas for which the final surface is gravel as show in the drawing.

1.06 SUBMITTALS

A. Submit as specified in contract document.
B. Shop Drawings:
    1. Sheeting and Shoring Plan – Prior to excavation, the Contractor shall submit a shoring design that is signed and sealed by a registered professional engineer in the State of Missouri for all excavations greater than twenty (20) feet in depth (in accordance with 29 CFR Past 1926 - OHSA Subpart P - Excavations and Trenches). Submittal will be for informational purposes only.
C. Testing Reports:
    1. Laboratory testing results for proposed Borrow Materials.
    2. Laboratory testing results and quarry control reports for Granular Material.
    3. Laboratory testing results for and quarry control reports Granular Bedding.
    4. Moisture-density (Proctor) test results.
D. Commercial Laboratory – submit name, contact information and certification of the commercial testing laboratory requirement.
E. Blasting (as applicable): Not Allowed

1.07 QUALITY ASSURANCE

A. The Contractor is responsible for the quality assurance and quality control of the Work.
B. Sampling and Testing:
    1. Tests to determine conformance with all requirements of this Specification for quality and properties of all Contractor-secured materials, including borrow materials proposed for use, shall be performed by an independent, state-certified, commercial laboratory retained and compensated by the Contractor and approved by the City or Engineer.
    2. All work associated with QUALITY ASSURANCE shall be included in the Bid Price and will be incidental to the Work. No separate measurement or payment will be made.
    3. Contractor required to retain a qualified surveyor to set control for the project.

1.08 PRODUCT DELIVERY, STORAGE AND HANDLING

A. The Owner will furnish the Site in accordance General Conditions specification.
B. General Project Requirements, paragraph EASEMENTS AND RIGHT-OF-WAY for use of private property for delivery, storage and handling.
C. Perform in a manner to prevent contamination or segregation of materials.

1.09 EXISTING UTILITES

A. The Contractor shall notify utilities prior to excavation in accordance with Section

00700 – General Conditions, Article 6 – Contractor's Responsibilities, paragraph NOTIFICATION OF ULTILITIES.

B. Contractor is responsible for reopening and repairing of any damage of existing utilities and pipes due to movement of construction machinery and equipment.
C. For work immediately adjacent to or for excavations exposing a utility or other buried obstruction, excavate by hand, start hand excavation on each side of the indicated obstruction and continue until the obstruction is uncovered or until clearance for the new grade is assured.
D. Support uncovered lines or other existing work affected by the excavation until approval for backfill is granted.
E. Report damage to utility lines or subsurface construction immediately.

PART 2 - PRODUCTS

2.01 MATERIALS ENCOUNTERED

A. Suitable Materials – Materials suitable for use in backfill, fill and embankment include job excavated or borrow material that is free of debris, roots, organic matter, frozen matter and shale particles/rock/stone or gravel with all dimensions less than 2 inches:
   1. Cohesionless materials include gravels, gravel-sand mixtures, sands and gravelly sands; generally exclusive of clayey and silty material with the following properties:
      (a) Free-draining.
      (b) Impact compaction will not produce a well-defined moisture-density relationship curve.
      (c) Maximum density by impact methods will generally be less than by vibratory methods.
      (d) Generally less than 15% by dry weight of soil particles pass a No. 200 sieve.
   2. Cohesive materials include materials made up predominately of silts and clays generally exclusive of sands and gravel with the following properties:
      (a) Impact compaction will produce a well-defined moisture-density relationship curve.
      (b) Are not free draining.

B. Unsuitable Materials – Materials unsuitable for use in backfill, fill and embankment include all material that contains debris, roots, organic matter, frozen matter, shale particles/rock/stone or gravel with any dimension greater than 2 inches. Additionally, as determined by the Owner/Design Professional, any other materials that are too wet or otherwise unsuitable for providing a stable subgrade or stable foundation for structures or trenches.
C. Material used for embankment or fill:
   For soils used below structural elements (such as: footings, slabs, pavements and mats), the portion of material passing the No. 40 sieve shall have a liquid limit not exceeding 40 and a plasticity index not exceeding 25 when tested in accordance with ASTM D4318.

2.02 TOPSOIL

A. On-Site Topsoil – Surface soil stripped and stockpiled on site and modified as necessary to meet the requirements specified herein. When available, topsoil must be existing surface soil stripped and stockpiled on the Site.
B. Off-Site Topsoil – Conform to requirements specified herein. Additional topsoil must be furnished by the Contractor.
C. Composition – Natural, friable soil representative of productive, well-drained soils in the area, free of subsoil, stumps, rocks larger than 2- inch diameter, brush, weeds, toxic substances and other material detrimental to plant growth. Amend topsoil pH range to obtain a pH of 5.5 to 7.
D. Topsoil shall be of a quality at least equal to the existing topsoil in adjacent areas, free from trash, stones, debris and well suited to support plant growth.

2.03 SOIL CONDITIONS

A. All Materials encountered, regardless of type, character composition and condition shall be considered "unclassified" for the purpose of payment. Determine quantity of various materials to be excavated prior to submitting Bid. Rock encountered shall be handled at no extra cost to Owner.

2.04 WASTE MATERIALS

A. Waste materials, as described for purposes of this Section, consist of unsuitable materials such as: rock, surplus excavated material, demolition debris and other materials considered unacceptable for use as fill or can be wasted on site, in designated areas shown in the plan.
B. Waste materials shall not include environmental pollutants, hazardous substances, contaminated products, by-products, samples or waste materials of any kind that are regulated under environmental laws.
C. Excess soil shall be stockpiled in areas indicated on plans or used as backfill on structures within the existing plant to be demolished and backfilled.

2.05 BORROW MATERIALS

A. Suitable fill materials, granular materials and topsoil obtained from locations arranged for by Contractor (off the Site) are required to the extent sufficient suitable materials cannot be obtained from excavation and trenching.
B. Borrow materials shall not exhibit characteristics of high shrink or swell potential as determined from Atterberg limit tests (ASTM D4318) and/or swell tests (ASTM D4546) unless otherwise specified herein.

2.06 GRANULAR FILL MATERIAL

A. Granular fill material shall consist of crushed stone, sand and gravel or reclaimed asphalt or concrete. The aggregate shall not contain more than 15 percent deleterious rock and shale. The fraction passing the No. 40 sieve shall have a plasticity index not to exceed six. Any sand, silt, clay and any deleterious rock and shale shall be uniformly distributed throughout the material.

B. Reclaimed asphalt or concrete materials meeting the requirements of aggregate must be approved for use by the City.
C. Granular fill material shall be in accordance with the following gradation requirements defined in Table 1 below:

Table 1. Gradation for Granular Fill Material

Sieve Size	Mass Percent Passing		
	MoDOT Type 5	AB3	KCMO PW 2202**
2 inch		0	
1 ½ inch		0-5	
1 ¼ inch			100
1 inch	100		72 to 100
¾ inch		5-30	60 to 90
½ inch	60 to 90		
3/8 inch			43 to 74
No. 4	35 to 60	35-60	28 to 60
No. 8		45-70	
No. 10			16 to 40
No. 30	10-35		
No. 40		60-84	3 to 22
No. 200	0-15	80-92	8 to 20*

1. For type AB-3, the fraction passing the No. 200 sieve shall not exceed ¾ of the fraction pasting the No. 40 sieve.
2. For KCMO PW 2200, the difference between Mass Percent Passing of successive sieve sizes shall not exceed 25%. That fraction of material; passing the No. 40 sieve shall have a plasticity index not to exceed 8.
3. MoDOT Type 5 material shall conform to Missouri Department of Transportation, Standard Specifications for Highway Construction, Section 1007, Type 5 Aggregate.

2.07 GEOTEXTILE
Not Used

2.08 CONTROLLED LOW STRENGTH MATERIAL (CLSM)
Not used

PART 3 - EXECUTION

3.01 DEMOLITION
Demolition shall be conducted in accordance with Section 02-41-00 – Demolition.

3.02 CLEARING AND GRUBBING

Perform clearing and grubbing, in accordance with Section 31 11 00 – Clearing and Grubbing, as indicated and as required to perform the Work.

3.03 STRIPPING

A. Stripping shall consist of scraping areas clean of all brush, grass, weeds, roots and other materials.
B. Remove topsoil from areas within limits of excavation, trenching, borrow and areas designated to receive fill.
C. Strip to a minimum depth of 6 inches, but to a sufficient depth to remove excessive roots in heavy vegetation, unsuitable material or brush areas and as required to remove all soil containing organic material or segregate topsoil.
D. Stockpile topsoil in areas designated or approved by the City/Design Professional where it will not interfere with construction operations or existing facilities. Stabilize and protect stockpiles from runoff per the SWPPP plan.

3.04 GENERAL REQUIREMENTS FOR OPEN EXCAVATIONS

A. Excavations shall be restored to the level of the adjacent surfaces as soon as practicable.
B. Protective Measures in Paved Areas:
    1. Excavations within paved areas shall be protected and secured in accordance with existing federal, state and local codes and standards. This includes, but not limited to, the most current edition of the Manual of Uniform Traffic Control Devices.

C Protective Measures Unpaved Areas:
    1. Supervision – As a temporary measure, the Contractor may provide personnel to supervise an open excavation that is not otherwise protected. Supervision shall ensure that the public is protected and shall serve the same function as a protective cover or fencing. A protective cover or fencing shall be installed for all excavations that are not supervised.
    2. Protective Cover – A protective cover shall be installed over the excavation so that it can sustain the weight of any persons and/or objects placed upon it. The cover shall be of sufficient weight or fixed to the ground so it cannot be moved. Protective covers shall have no opening(s) or protuberance(s) of sufficient size to cause a fall or injury. Advance warning devices shall be installed as required by the City/Design Professional.
    3. Fencing – Any excavation that is not covered shall be fenced in so that it surrounds the entire excavation area and prevents entry. The fencing shall be minimum of 42 inches in height. The fence shall be secured and upright at all times.
D. Inspection and Maintenance – Protective measures (coverings and fences) shall be inspected by the Contractor at least daily to assure integrity. Protective measures in heavy traffic areas shall be inspected more often as necessary.
E. Excavation permits shall be secured prior to starting the work.

3.05 EXCAVATION

A. Excavations shall provide adequate working space and clearances for the work to be performed therein and for installation and removal of concrete forms.
B. In no case shall excavation faces be undercut for extended footings.
C. Subgrade surfaces shall be clean and free of loose material of any kind when concrete is placed thereon.
D. Classification of Excavated Materials – No classification of excavated materials will be made. Excavation and trenching work shall include the removal and subsequent handling of all materials excavated or otherwise removed in performance of the work, regardless of the type, character, composition or condition thereof.

3.06 DEWATERING

A. Dewatering equipment shall be provided to remove and dispose of all surface water and groundwater entering excavations, trenches or other parts of the Work.
B. To prevent damage from hydrostatic pressure, flotation or other cause, all excavations shall be protected and kept dry during subgrade preparation and continually thereafter until the structure is built or the pipe is installed and the area is backfilled.
C. All excavations for concrete structures or trenches which extend down to or below groundwater shall be dewatered by lowering and keeping the groundwater level beneath such excavations 12 inches or more below the bottom of the excavation.
D. Surface water shall be diverted or otherwise prevented from entering excavations or trenches to the greatest extent possible without causing damage to adjacent property.
E. If the material within the excavation becomes unsuitable or unstable as a result of the Contractor's inability to implement adequate surface diversion or dewatering measures, then the Contractor shall remove unsuitable materials and replace with approved compacted fill material as directed by City and at no additional cost to the City.
F. Surface water and groundwater that contains silt and soil shall not be disposed of without pre-treatment.
G. The Contractor is responsible for the condition of any pipe, conduit or drainage way which is utilized for drainage purposes. Any such pipe, conduit or drainage way utilized shall be left clean and free of sediment.

3.07 SHEETING AND SHORING

A. The Contractor shall provide all shoring, bracing, cribbing, trench boxes, underpinning and sheeting as necessary to support excavations.
B. The Contractor shall provide a Sheeting and Shoring Plan that includes provisions that will accomplish the following:
    1. Prevent undermining of pavements, foundations and slabs.
    2. Prevent slippage or movement in banks or slopes adjacent to the excavation.
    3. Allow for the abandonment of shoring and sheeting materials in place in critical areas as the Work is completed. In these areas, backfill the excavation to within 3 feet of the finished grade and remove the remaining exposed portion of the shoring before completing the backfill.
    4. Except where banks are cut back on a stable slope, excavations for structures shall be supported as necessary to prevent caving or sliding.

5. Excavations shall provide adequate working space and clearances for the Work to be performed.
6. Undercutting of excavation faces is prohibited.

3.08 BACKFILL AND COMPACTION

A. Fills and embankments shall be constructed to the lines and grades indicated on the Drawings, using suitable material.
B. Weather Limitations – Construction of fills and embankments during freezing weather shall not be done except by permission of the City/Design Professional. No fill or embankment materials shall be installed on frozen surfaces, nor shall froze material, snow or ice be placed in the fill or embankment.
C. After preparation of the fill or embankment site, the subgrade shall be leveled and rolled so that surface materials of the subgrade will be compacted and well bonded with the first layer of the fill or embankment and for subsequent layers.
D. All fill and embankment materials shall be placed in layers not to exceed 8 inches in un-compacted thickness.
E. Excess soil shall be stockpiled in areas indicated on plans or used as backfill on structures within the existing plant to be demolished and backfilled. No shale particles, rock, gravel or stone with any dimension greater than 2 inches shall be placed in the upper 18 inches of any fill or embankment. Rocks or stones within the allowable size limit may be incorporated in the remainder of fills and embankments, provided they are distributed so that they do not interfere with proper compaction.
F. The material in each layer shall be wetted or dried as required and thoroughly mixed to ensure uniform moisture content and adequate compaction. Each layer shall be thoroughly compacted as follows:
    1. Unpaved Areas:
        (a) 95% of maximum dry density at moisture content range from 3% below optimum to 2% above optimum as determined by ASTM D698.
        (b) If the material fails to meet the density specified, compaction methods shall be altered.
    2. Paved Areas:
        (a) All subgrades below paved area and within 1 foot of a paved areas shall be compacted to 95% of maximum dry density at moisture content range from 3% below optimum to 2% above optimum as determined by ASTM D698 for the subgrade 1 foot outside of paved areas.
        (b) If the material fails to meet the density specified, compaction methods shall be altered.
G. Trenches in Embankments – Wherever a trench is to pass through a fill or embankment, the fill or embankment material shall be placed and compacted to an elevation not less than 36 inches above the top of pipe elevation before the trench is re-excavated.
H. Unless otherwise specified in Section 01015 – Specific Project Requirements, trenches and pipes that pass through a water-containing embankment shall eliminate the granular embedment material and the trench bottom shall be graded to provide uniform and continuous support for the pipe. The pipe shall be embedded in embankment material

containing no rocks, stones or other pervious material. The embedment material shall be compacted as specified for the embankment.

3.09 GRANULAR FILLS

A. Granular fill material shall be provided where indicated on the drawings.
B. Granular fill material shall be placed on suitably prepared subgrades and compacted by vibration.
C. If the material fails to meet the density specified, compaction methods shall be altered.
D. Where granular fills are to be covered with concrete, the top surface shall be graded to the required subgrade.
E. Granular fill should be placed in loose lifts not in excess of 8 inch thick.

3.10 FIELD QUALITY CONTROL

A. Compaction Tests:
    1. Two initial gradation tests shall be made for each type of embedment, fill and backfill material used and one additional gradation test shall be made for each additional 500 tons of each material. At the sole expense of the Contractor, moisture-density (Proctor) tests, relative density tests on the materials and all in place field density tests shall be performed by the Contractor. All tests performed shall be done in accordance with ASTM D698.
    2. The method of in-place compaction testing including density and moisture content shall be as follows:
        (a) Density - Cohesive materials: ASTM D2167, ASTM D1556 or ASTM D6938.
        (b) Density - Cohesion-less materials: ASTM D6938.
        (c) Moisture Content: ASTM D6938.
    3. The minimum frequency of in-place compaction testing including density and moisture content will be as follows:
        (a) At least one test for every 2,000 cubic yards of material placed in a mass fill or for every 1000 sf
        (b) At least one test when the City suspects the quality of moisture control or effectiveness of compaction.
    4. Any material/fill failing to meet required densities shall be removed, replaced and compacted as necessary to achieve specified results.
    5. Removal of in-place material and replacement with approved new material will be required if scarifying and re-compaction do not produce the required densities.

3.11 EQUIPMENT

A. The Contractor shall utilize appropriate equipment to obtain the compaction requirements specified. Acceptable equipment includes, but is not limited to, the following:
    1. Tamping Rollers.
    2. Pneumatic Rollers.
    3. Vibratory Rollers.

4. Other methods that have been tested and have been shown to meet the specified compaction rates.

B. Power tampers or rammers shall be used for the compaction of material in areas where it is impractical or unsafe to use heavy equipment or as recommended by the City.
C. Vibratory plate compactors, manual or attached to excavation equipment, may be used for consolidation of embedment and compaction of granular fill in areas where it is impractical or unsafe to use heavy equipment or as recommended by the City.
D. All compaction equipment is subject to the approval of the City/Design Professional.

3.12 GRADING

A. General: Uniformly grade areas to a smooth surface, free of irregular surface changes. Comply with compaction requirements and grade to cross sections, lines, and elevations indicated.
    1. Provide a smooth transition between adjacent existing grades and new grades.
    2. Cut out soft spots, fill low spots, and trim high spots to comply with required surface tolerances.
B. Site Grading: Slope grades to direct water away from buildings and to prevent ponding. Finish subgrades to required elevations within the following tolerances:
    1. Lawn or Unpaved Areas: Plus or minus 1 inch.
    2. Sidewalks: Plus or minus 1 inch.
    3. Pavements: Plus or minus 1/2 inch.
C. Grading inside Building Lines: Finish subgrade to a tolerance of 1/2 inch when tested with a 10-foot straightedge.

3.13 PROTECTION

A. Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.
B. Repair and reestablish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions. Scarify or remove and replace soil material to depth as directed by Engineer; reshape and recompact.
C. Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.14 FINAL GRADING AND PLACEMENT OF TOPSOIL

A. After all trenching, backfilling, compaction and embankments to be constructed have been rough graded, all areas shall be final graded to the indicated elevations, slopes and contours.
B. All cuts, fills, embankments and other areas which have been disturbed or damaged by construction operations shall be surfaced with at least 6 inches of topsoil to meet final grade.

C. Use of graders or other power equipment will be permitted for final grading and dressing slopes, provided the result is uniform and equivalent to manual methods.
D. All surfaces shall be graded to provide effective drainage. Unless otherwise indicated, a slope of at least 1 percent shall be provided.
E. Final grade shall be smooth, even and free from clods, rocks, stones, weeds, brush and other debris.

3.15 DISPOSAL OF EXCESS EXCAVATED MATERIALS

A. Except as otherwise permitted, all excess excavated materials shall be stockpiled in the designated areas mention in the drawing.
B. Demolition Debris, see Section 02 41 00 – Demolition.
C. Rock – Excavated rock in excess of the amount permitted to be installed in trench backfill shall be disposed of off-site.
D. Other Debris – Waste material and other debris encountered in during excavation shall be disposed of off-site.
E. The disposal of waste and surplus excavated materials, including hauling, handling and grading is incidental to Earthwork. No separate measurement or payment shall be made.

3.16 RIGHT OF WAY CLEARING

A. Stump Treatment;
Du Pont "Krenite S" or approved equal. To facilitate application, supervision, and inventory of TM units, as defined in PART 3.02, the spray solution shall be colored by the addition of an oil soluble red dye suitable for use in the chemical mixture. The dye shall be equivalent to "Oil Red" or "Red O."
B. Clearing and Brush Removal:
    1. Trim, remove, or protect trees as indicated by Contract Drawings or as instructed by the Engineer or Owner.
    The right-of-way shall be "clear cut" as indicated. Cut stumps to within 3 inches of ground level. Treat the entire stump with the specified stump treatment in accordance with the manufacturer's recommendations. If treatment is sprayed, perform spraying in such manner, at such pressure, and under such wind conditions that drift of spray material to adjacent vegetation will be avoided. Treatment should be performed the same day that brush and tree cutting removal work is completed but in no event later than 72 hours from the time tree cutting is performed. If moisture or wind conditions prevent treatment in accordance with the above, perform treatment as soon thereafter as possible.
    2. For trees in yards, grub stumps to 6 inches below grade and restore the ground to match the surrounding yard.
    3. After trimming, trees shall have a balanced, symmetrical shape.
    4. Where rights-of-way cross major roads or rivers, access to the rights-of-way shall be such that a screen of natural vegetation is left the full width of the right-of-way on each side of the road or river crossing.

END OF SECTION 31 20 50

SECTION 31 23 33 – TRENCHING AND BACKFILLING FOR OPEN-CUT CONSTRUCTION

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes:
   1. Excavation, sheeting, bracing and all operations necessary for the preparation of trenches for bedding pipes and pipe appurtenances, conduit and buried cable.
   2. Pipe embedments and encasements.
   3. Filling (under, adjacent, and above pipes, conduits and buried cables) of trenches.

B. Related Work Specified Elsewhere:
   1. Site Preparation and Earthwork: SECTION 31 20 50.
   2. Concrete: DIVISION 3.

1.03 SUBMITTALS:

A. Submit as specified in DIVISION 1.

1.04 QUALITY ASSURANCE:

A. Sampling and Testing:
   1. Tests to determine conformance with all requirements of this Specification for quality and properties of all Contractor-secured materials, including borrow materials (both on or

off Site) proposed for use, shall be performed by an independent, commercial laboratory retained and compensated by Contractor, and accepted by Engineer.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. Definitions and classifications of materials used in this Section are stated in PART 3 - EXECUTION this Section.

PART 3 - EXECUTION

3.01 TRENCHING:

A. General:
   1. Excavate all materials within the specified limits for excavation.
   2. Perform excavation by any recognized method of good practice to complete the Work in the most expeditious manner in conformance with specified requirements.
   3. Take precautions to ensure no damage to existing facilities or equipment, or other work.
   4. All materials encountered, regardless of type, character, composition, and condition thereof, shall be considered "unclassified" for the purpose of payment. . Rock encountered shall be handled at no extra cost to Owner.

B. Equipment and Methods:
   1. Types of equipment and methods may be at Contractor's option, where structures or other facilities are not endangered.
   2. Perform by hand methods when required to save or protect trees, culverts, utilities, or other structures above or below ground.

C. Blasting:
   1. Blasting will not be permitted.

D. Side Walls:
   1. Make vertical or slope within specified trench width limitations below a horizontal plane 12 inches above top of pipe.
   2. Make vertical or sloped as required for stability, above a horizontal plane 12 inches above top of pipe.
   3. Excavate without undercutting.
   4. Sheet and brace where necessary.
      a. Use where required by Specifications or Drawings and where resulting slopes from excavation or trenching might endanger (in-place or) proposed structures.
      b. Mandatory where sloped side walls would extend beyond construction right-of-way and as indicated on Drawings.
      c. Provide on Site prior to start of excavation in each section, and make such adjustments as are required to meet unexpected conditions.
      d. Space and arrange sheeting and bracing as required to exclude adjacent material and according to the stability of excavation slopes.
      e. Remove simultaneously with filling, except as otherwise approved, and fill voids left after withdrawal with granular fill or other approved material.
      f. Leave in place when required by conditions of supported material and cut off at approved elevation below the surface.
         (1) No higher than one foot below finished surface grade, and

(2) No lower than one foot above top of buried pipe or conduits.

E. Trench Depth:
1. Depth shall be sufficient to provide the minimum bedding requirements for the pipe being placed.
2. Do not exceed that indicated where conditions of bottom are satisfactory.
3. Increase depth as necessary to remove unsuitable supporting materials. Unsuitable materials shall be defined as mud, muck, frozen earth, and material that is not free of debris, roots, organic matter, refuse, ashes, and cinders.

F. Trench Bottom:
1. Protect and maintain when suitable natural materials are encountered.
2. Remove rock fragments and materials disturbed during excavation or raveled from trench walls.
3. Restoring overexcavation:
   a. Restore overexcavation of depth 6 inches or less with trench stabilization material.
   b. Correct at no extra cost to Owner when trench is overexcavated without authority or to stabilize bottom rendered unsuitable through negligence or improper operations.
   c. Trench Stabilization Material:
      (1) Materials shall be one of the following:
         (a) As specified for Granular Pipe Embedment.
         (b) Conform to ASTM D1241, Gradation A or B.
      (2) Compact in lifts not exceeding 6 inches loose thickness.
         (a) With pneumatic or vibratory equipment.
         (b) To density specified for granular pipe embedment.

G. Trench Width:
1. Excavate trench to a width which will permit satisfactory jointing of the pipe and thorough tamping of the bedding.
2. For single pipe installation maintain trench widths below a plane 12 inches above top of pipe as follows:

	Trench Width	
Nominal Pipe Size	Minimum	Maximum
Less than 24"	Pipe od + 1'	Pipe od + 2'
24" to 60"	Pipe od + 2'	Pipe od + 4'
Larger than 60"	Pipe od + 3'	Pipe od + 5'

3. For multiple pipe installations maintain trench widths below a plane 12 inches above the top of the largest pipe as follows:

	Trench Clearances	
Nominal Pipe Size of Outside Pipe	Minimum From Outside Pipe	Maximum From Outside Pipe
Less than 24"	6"	12"
24" to 60"	12"	24"
Larger than 60"	18"	30"

4. Above plane defined in 2. and 3., no maximum limit.
5. Maximum trench width limitations shall apply beginning 3 feet from manhole or structure walls.

6. Maximum width shall be as near the minimum specified as can be controlled by construction equipment and methods used.

H. Trenching in Fill Areas: Perform after compacted fill has reached an elevation of not less than one foot above the top of the pipe.

I. Test Pits:
1. Excavate test pits sufficiently in advance of trenching to enable adequate planning of construction procedure.
2. Locate as follows:
a. Where unstable material is suspected that may require special protective measures.
b. Where ground water may require special handling methods.
c. Where indicated or otherwise approved.
d. Where interference or conflict with other utilities and/or structures could affect alignment of pipe.
3. With lateral dimension not less than minimum trench width specified for location excavated.
4. To depth required to obtain information desired.

3.02 PIPE EMBEDMENTS AND ENCASEMENTS:

A. Granular Pipe Embedment:
1. Gradation: Conform to one of the following:
a. Gravel or crushed stone which shall not have a loss of more than 15% after 5 cycles when tested for soundness with sodium sulfate as described in ASTM C88, and shall be of the following gradation:

Percent Passing	Sieve Size
100	3/4-inch
40-60	3/8-inch
0-5	No. 8

2. Placement: Place granular embedment as follows:
a. Level bottom layer at proper grade to receive and uniformly support pipe barrel throughout its length.
b. Form shallow depression under each joint to facilitate grouting.
c. Add second layer simultaneously to both sides of the pipe with care to avoid displacement.
d. Complete promptly after completion of jointing operationsand approval to proceed.
e. Substitute for any part of earth fill to within 2 feet of final grade at Contractor's option.
3. Compaction: Compact granular bedding as follows:
a. In lifts not exceeding 12 inches in compacted depth.
b. Rod, spade, or use pneumatic or vibratory equipment:
(1) Throughout depth of embedment.

3.03 TRENCH FILL:

A. General:
1. Complete placement promptly after approval to proceed.
a. Upon completion of pipe embedment.

b. Only after concrete encasement has obtained 70% of design strength. Determination of design strength percentage obtained shall be as specified in DIVISION 3.

2. Use hand methods to a horizontal plane 12 inches above top of pipe conduit or duct banks.
3. Use approved mechanical methods where hand fill is not required.
4. Until compacted depth over conduit exceeds 3 feet, do not drop fill material over 5 feet. Then distance may be increased 2 feet for each additional foot of cover.

B. Earthen (Cohesive) Fill:
1. Suitable fill materials include material from excavations and borrow areas that is free of debris, roots, organic matter, refuse, ashes, cinders, frozen earth, and which is free of rock with any dimension greater than one-half the specified thickness.
2. Unsuitable materials include material that does not conform to the above or other materials that are determined by Engineer as too wet or otherwise unsuitable for providing a stable fill.
3. Moisture content shall be that required to obtain specified compaction of the soil or as indicated.
4. Perform moisture curing by wetting or dryinig of the material as required to attain compaction criteria.
5. Compact with approved equipment to a minimum of 95% of maximum dry density within the moisture content range from -3% below optimum to +3% above optimum. Optimum moisture and maximum density shall be determined by ASTM D698.

C. Compaction Testing:
1. The method of in-place compaction testing, including density and moisture content, shall be as follows:
a. Density - cohesive materials: ASTM D2167 and ASTM D1556.
b. Density - cohesionless materials: ASTM D6938.
c. Moisture Content: ASTM D6938.
2. The minimum frequency of in-place compaction testing including density and moisture content will be as follows:
a. At least one test every 100 feet of trench length under pavement and for every three vertical feet of backfill lifts placed. A minimum of two sets of test are required for each trench backfilled regardless of length
b. At lest one test every 300 feet of trench length in unpaved areas and for every three vertical feet of backfill lifts placed. A minimum of two sets of test are required for each trench backfilled regardless of length.
3. Fill failing to meet required densities shall be removed or scarified and recompacted as necessary to achieve specified results, at no additional cost to OWNER.
4. Removal of in-place material and replacement with approved new material will be required if scarifying and recompaction do not produce the required densities.

D. Equipment:
1. Compaction equipment shall conform to the following requirements and be subject to the approval of Engineer.
a. Tamping Rollers:
(1) May be towed or self-propelled.
(2) Have staggered uniformly spaced knobs or feet. When fully loaded, they shall exert at least 250 psi on combined area of tamping feet in contact with ground.

(3) Be equipped with cleaning fingers maintained at full length to prevent accumulation of material between feet.
(4) Maintain all equipment in good repair.

b. Pneumatic rollers:
(1) Have two axles, not less than 9 wheels with pneumatic tires of equal size, diameter, and ply rating, a rigid steel frame, and a body suitable for ballast loading. Tracking wheels shall overlap by a minimum of 1/4-inch.
(2) Tires shall be uniformly inflated at all times.
(3) May be self-propelled or towed.

c. Power tampers shall be used for compaction of material in areas where it is impractical or unsafe to use heavy equipment, and as recommended by Engineer.

d. Vibratory rollers:
(1) Have either one or two smooth-surfaced steel drums with a minimum diameter of 42 inches.
(2) Have a minimum vibrating force of 300 pounds per cycle per inch of drum width.
(3) Have a minimum vibrating frequency of 1,200 cycles per minute with a means of adjusting the resonance of the dynamic force.
(4) May be self-propelled or towed.

e. Vibratory plate compactor may be used for compaction of sand and/or gravel material in areas where it is impractical or unsafe to use heavy equipment, and as recommended by Engineer.

END OF SECTION 31 23 33

SECTION 31 66 12 – CAST-IN-PLACE GROUND IMPROVEMENT ELEMENTS

PART 1 - GENERAL

1.01 SUMMARY:

A. Work under this Section shall consist of designing, furnishing, and installing cast-in-place ground improvement elements (CGEs) as indicated on the Drawings and specified in this Section.

B. The Contractor shall secure the services of a Professional Engineer licensed in Missouri to design CGEs and the load transfer platform (LTP) to provide bearing capacity and mitigate the effects of settlement on the proposed foundations for protection of structures and utilities at the Project Site.

C. At a minimum, this Work shall include the following:

1. Detailed planning and design of the CGEs and LTP to satisfy the requirements of this Section.
2. Supply of all equipment, material, labor, and supervision to install the CGE and LTP system.
3. Obtaining the applicable State and municipal permits (if required), and for conforming to all State and local regulations.
4. Adherence to all methods and standards described in this Specification.
5. Layout of CGEs, spoil removal, dewatering, subgrade preparation following CGE installation and all associated work shall be included as part of the Work.

D. Contractor shall visit the Site prior to bidding to observe and review specific Site conditions and requirements for equipment, methods, and costs for the CGEs.

E. Contractor shall verify the location of all underground conduits, piping, duct banks and utilities prior to installation.

1.02 REFERENCE STANDARDS:

A. General:

1. Standards listed by reference, including revisions by issuing authority, form a part of this Section to extent indicated. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referred to by issuing authority abbreviation and standard designation.
2. Where specifications and reference documents conflict, the Owner shall make the final determination of applicable document.
3. Unless otherwise noted, the latest revision of the following reference standards shall apply to this Section. B. Applicable Standards:

1. American Society of Civil Engineers (ASCE):
   a. ASCE/SEI 7-10 - Minimum Design Loads for Buildings and Other Structures.
2. ASTM International (ASTM):
   a. C31 – Making and Curing Concrete Test Specimens in the Field
   b. C33/C33M - Concrete Aggregates.
   c. C109/C109M - Compressive Strength of Hydraulic Cement Mortars (Using 2-inch or 50-mm Cube Specimens).
   d. C125 - Concrete and Concrete Aggregates.

e. C150/C150M - Portland Cement.
f. C494/C494M - Chemical Admixtures for Concrete.
g. C618 - Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete.
h. C937 - Grout Fluidifier for Preplaced-Aggregate Concrete.
i. C938 - Proportioning Grout Mixtures for Preplaced-Aggregate Concrete.
j. C939 - Flow of Grout for Preplaced-Aggregate Concrete (Flow Cone Method).
k. C940A - Expansion and Bleeding of Freshly Mixed Grouts for PreplacedAggregate Concrete in the Laboratory.
l. C941 - Water Retentivity of Grout Mixtures for Preplaced-Aggregate Concrete in the Laboratory.
m. C942 - Compressive Strength of Grouts for Preplaced-Aggregate Concrete in the Laboratory.
n. C953 - Time of Setting of Grouts for Preplaced-Aggregate Concrete in the Laboratory.
o. C1107/C1107M- Packaged Dry, Hydraulic-Cement Grout (Nonshrink).
p. D 1194 – Bearing Capacity of Soil for Static Load and Spread Footings.

3. International Code Council:
   a. 2018 International Building Code (IBC, 2018).

1.03 EXPERIENCE QUALIFICATIONS:

A. The CGEs shall be installed by a specialty contractor with documented experience with CGEs.
B. The Contractor shall provide experienced management, supervisory, engineering, and other related key personnel as required to implement the CGE program, as follows:
   1. The project manager shall have experience with CGEs while in the full-time employ of the Contractor.
   2. The superintendent shall have experience with CGEs while in the full-time employ of the Contractor.
   3. The Contractor's Professional Engineer shall have experience with design of the CGEs and LTPs and be licensed in Missouri.
C. As detailed in this Section, the Contractor shall provide evidence of previous CGE project experience, and evidence of management, supervisory, engineering, and other related key personnel experience.
D. The experience statement of past work and description of equipment and techniques proposed for use shall be submitted at time of Bid and will be considered in the evaluation of bids. Work may be suspended if Contractor substitutes unqualified personnel for approved personnel during construction. If work is suspended due to the substitution of unqualified personnel, Contractor shall be liable for additional costs resulting from the suspension of work and no adjustment in contract time resulting from the suspension of work will be allowed.
E. The Contractor shall not sublet the whole or any part of the contract without the express permission in writing.

1.04 DEFINITIONS:

A. Cast-in-place ground improvement elements (CGEs) – A ground improvement method that consists of the construction of vertical grout columns. The drill stem is typically advanced using either full or partial displacement techniques, and the resulting void is then filled with fluid cement grout as the drill stem is removed from the drill hole.

B. CGE system – All cast-in-place ground improvement elements, the Load Transfer Platform, and any other elements required for adequate performance of the ground improvement.
C. Load Transfer Platform (LTP) – Also known as a bridging layer, an engineered layer of select fill between the top of the CGEs and the base of the foundations which provides a load path between the bearing pressures of the shallow foundations and the point-like supports of the cast-in-place ground improvement elements. The LTP may or may not be geosynthetic reinforced, depending on the design provided by the Contractor's Professional Engineer.

1.05 DESIGN CRITERIA:

A. At a minimum, Contractor's CGE system shall satisfy the following minimum design criteria:
1. The Contractor's Professional Engineer shall consider all available subsurface information in the development of the final design soil profile.
2. A detailed explanation of the design parameters and methodology used for the settlement mitigation calculations shall be included in the Final Design Submittal along with calculations that demonstrate that the required settlement tolerances are met under both static and seismic loading.
3. The final design performed by the Contractor's Professional Engineer shall demonstrate that the proposed system will not negatively impact the adjacent existing structures.
4. The final CGE system design shall meet the following structural loading and settlement criteria:
    (1) Allowable Settlement
        (a) Total: 1.0 inch
        (b) Differential: 0.5 inches
    (2) Allowable Bearing Capacity as indicated on the Drawings.
5. The final CGE design shall consider the potential interaction with existing and proposed foundation elements, as indicated on Drawings. Sequencing of CGE installation and other work shall be considered by the Contractor to prevent adverse effects to either system.
6. CGE elements shall be designed to bear in limestone or shale bedrock.
7. Contractor's Professional Engineer shall consider both immediate and consolidation settlement in and below the treated soil zone.
8. The design life of the CGE system shall be 100 years.
9. Contractor shall demonstrate that their proposed ground improvement system has been evaluated by the International Code Council, and are in compliance with the applicable provisions of IBC (2018).

1.06 SUBMITTALS:

A. Submit as specified in DIVISION 01.
B. Bid Submittals:
1. Experience Qualifications.
    a. A list of at least 5 previously completed projects of similar scope and purpose for review. The list shall include a description of the project, relative size, and contact person with current phone number.
    b. Resumes of the management, supervisory, engineering, and other related key personnel, for review as defined in 1.03.
2. CGE System Submittal:

a. Details and all applicable manufacturer data for all materials associated with the proposed CGEs.
b. Type of drilling equipment, including model, torque and crowd of drive head; a description of the leads and torque arm, grout pump make, model and specifications. Contractor shall clearly identify equipment suitable for low overhead and limited access conditions, where applicable.
c. Detailed description of proposed method(s) and sequence of installation, including:
   (1) Drilling, grouting, and reinforcement installation
   (2) Target installation tooling rotation speed
   (3) Drilling penetration rates
   (4) Torque
   (5) Crowd
   (6) Grout pressures
   (7) Estimated production rates
   (8) Details of methods to be used to remove soil and debris from the top of CGE after grouting.
d. Description and specifications of automated installation-monitoring equipment to be used on the project. As a minimum the submittal shall contain the following information:
   (1) Manufacturer and model of the equipment and components.
   (2) Description of equipment function.
   (3) Sample of the information collected and printout provided.
   (4) Certification that the equipment can provide the information outlined in this Section.
   (5) Records indicating that the equipment has been calibrated within the past 6 months.
e. Construction drawings, and shop drawings for review.
f. A detailed installation sequence, procedure and proposed schedule.
g. A work procedures plan outlining the spacing, location, depth and estimated quantity of CGEs to achieve the specified criteria detailed in this Section. Locations of individual CGEs shall be dimensionally referenced to the structural foundation locations indicated on the Drawings.
h. Details of the LTP including components, extents, thickness, installation methods, lift thickness, compaction energy, fill sources, materials, and other pertinent information.
i. Submit details of the proposed quality control test program for the CGE system. C. Design and Pre-Construction Submittals:

1. Final Design Submittal:
   a. Contractor's Professional Engineer shall submit a Final Design Submittal; including sealed calculations, sealed construction drawings, and shop drawings for review at least 3 week(s) prior to the beginning of construction.
   b. Final Design shall demonstrate that all applicable Design Criteria, as outlined in this Section, have been satisfied by the proposed system.
   c. The CGE system shall be designed in accordance with generally-accepted engineering practice and per the requirements of this Section.

d. Design shall explicitly provide all assumed or calculated soil design parameters and methods/references for developing these parameters.

2. Submit details and all applicable manufacturer data for all materials associated with the CGE system.
3. Provide a detailed installation sequence, procedure and proposed schedule.
4. Existing utility facilities shall be included and, after checking their locations by field investigations, the working drawings shall be revised to show the actual locations of facilities, location of excavation supports, interference with the proposed Work, and how Contractor proposes to overcome these interferences.
5. Pre-excavation Survey Report.
6. Professional Liability Insurance:
   a. In addition to any requirements specified elsewhere in the Contract Documents, the Contractor shall also provide evidence of insurance coverage for Errors and Omissions associated with design of the ground improvement work.
   b. The insurance policy should provide a minimum coverage of $3 million per occurrence. Certificate evidencing this coverage shall be provided prior to start of design.

D. Construction and Closeout Submittals:

1. Daily Progress Reports – Furnish daily a complete and accurate record of CGEs.
   a. The record shall indicate the following (as applicable):
      (1) element location,
      (2) element diameter,
      (3) element length,
      (4) type of material(s) used,
      (5) element and material volumes,
      (6) number of lifts,
      (7) number of pump strokes,
      (8) force/pressure during installation,
      (9) final elevations or depths of the base and top of element,
      (10) description of soils penetrated,
      (11) bearing strata encountered,
      (12) nature and location of obstructions, if encountered,
      (13) flow cone time in seconds and size of cone orifice, for each truck,
      (14) grout truck ticket number,
      (15) start and stop time of grouting,
      (16) theoretical CGE volume (based on auger diameter and depth),
      (17) grout calibration factor and date/method of calibration,
      (18) pump calibration,
      (19) number of pump strokes to build initial pressure head,
      (20) grout pump strokes for each maximum 5-foot increment of CGE,
      (21) grout factor per maximum 5-foot increment,
      (22) total pump strokes to complete CGE,
      (23) overall grout factor (actual grout volume pumped into the CGE divided by the theoretical CGE volume; the grout factor shall not include the grout required to fill the lines or auger nor any excess grout pumped at the ground surface),

(24) grout return (auger tip depth at the time that grout is first observed at the ground surface),
(25) amount of grout used for each CGE,
(26) cumulative amount of grout for the day,
(27) quantity and time of grout cube sets made,
(28) as-built elevation data (ground surface, CGE tip and cutoff, and reinforcing steel). Note compliance with installation tolerances,
(29) remarks concerning installation of CGE.

b. Immediately upon completion of grouting for each CGE, Contractor shall submit a report of the automated measuring and recording equipment output to the Owner as described in this Section.

c. Load Transfer Platform placement records including:
(1) Reinforcement type
(2) Reinforcement placement location and methods
(3) Lift material type and source
(4) Lift thickness and compaction

d. Contractor shall immediately report any unusual conditions encountered during installation.

PART 2 - PRODUCTS

2.01 GENERAL:

A. All products used shall be submitted for review at the time of Bid, and shall demonstrate suitable performance during all verification testing and other related quality control testing.

2.02 GROUT:

A. Nonshrink, cement-based grout, consisting of the following materials and so proportioned to produce a hardened mortar with a compressive strength as determined by the design provided by the Contractor's Professional Engineer and as referenced to ASTM C125.
1. Portland Cement: Conforming to ASTM C150.
2. Special Pozzolan: Consisting of a finely powdered siliceous material and conforming to ASTM C618.
3. Grouting Agent: Use a grouting agent (fluidifier) that will reduce the mixing water requirements of the cement mortar, retard the setting time, decrease bleeding, eliminate setting shrinkage, increase fluidity, and conform to ASTM Specifications C494/C494M, C937, C938, C939, C940, C941, C942, C953, and C1107/C1107M. Dry grouting agent shall be powdery and in as-manufactured condition at the time of use. Grouting agent shall be supplied in bags or other suitable containers that provide protection from the weather. Grouting agent that has been exposed to the weather shall not be used.
4. Water: Use fresh clean water free from injurious amounts of sewage, oil, acid, alkali, and organic matter.
5. Fine Aggregate:
a. Meet the requirements of ASTM C33/C33M.
b. Consist of clean, natural sand or of hard, dense, durable, uncoated rock particles and be free from injurious amounts of silt, loam, lumps, soft or flaky particles, shale, alkali, organic matter, mica, chert, and other deleterious substances.

c. Be well graded from coarse-to-fine, with a fineness modulus between 1.40 and 3.40.

B. Mixing:

1. Mix the cement grout with approved equipment and accurately measure all materials by volume or weight. Charge the mixer in the following order: water, grouting agent, and other solids in order of increasing particle size. Rotate mixing drum 25 revolutions following placement of grouting agent or additives in the field, in order to provide proper mixing of grout.
2. Mixing time shall not be less than one minute producing a homogenous grout having a consistency ranging between 16 and 35 seconds when tested with a flow cone having a ½-inch opening, or between 10 and 25 seconds when tested with a flow cone having a ¾inch opening, in accordance with ASTM C939. Provide a flow cone and perform the flow cone test at least once per truck within 30 minutes prior to use of grout from each truck, or as otherwise directed by Owner.
3. The grout shall have a minimum temperature during placement of 40° F and a maximum temperature during placement of 95° F.
4. If grout is agitated continuously and meets temperature and flow requirements, it may be held in the mixer up to 90 minutes after batching prior to placement in CGE. This period may be extended to 2 hours, as approved by Owner.
5. Retempering grout will not be permitted. C. Pumping:

1. Use approved pumping equipment having a screen no larger than 3/8 inch between mixer and pump and having a working pressure gauge in clear view of the operator. The grout pump shall be a positive displacement pump capable of developing displacement pressures at the pump of at least 350 psi. All oil, rust inhibitors and solvents shall be removed from the grout pump and associated grout handling equipment.
2. Perform calibration of the pump in the field prior to installation of CGEs with Owner present to observe, according to the following:
   a. Place grout into the hopper and pump through the line and auger into a large container of known volume not less than 7.0 cubic feet; i.e., a barrel or 55 gallon drum.
   b. Perform calibration of the pump in the field at the beginning of the work, after repairs and/or maintenance that could affect pump performance, once each week provided at least 100 CGEs have been installed using the pump since the previous calibration, and at Owner's request if Contractor changes or varies equipment, or should volumes of grout take calculated during grout placement become suspect due to variations in calculated quantities or due to pump "short stroking" or missing complete strokes.
   c. The pump calibration is performed by recording the number of strokes required to fill at least 75% of the calibration container, and is recorded as cubic feet per stroke. Grout flow shall be determined and recorded at the time of each calibration.
   d. The Owner may require a calibration using a larger sample size (i.e. fully loaded grout trucks) if the reliability of the initial calibration is found to be in question by the Owner.

E. Grout flow cone test results shall be determined and recorded at the time of each calibration.Calibrations as determined in the field will be used in lieu of manufacturer’s rated or factory calibrations.

3. Contractor shall provide a positive means of counting pump strokes. Such methods may include digital or mechanical counters, or other methods approved in advance by Owner.
4. Grout pressure shall be measured at the point where the grout hose enters the tooling. Real-time measurement of grout pressure and depth shall be displayed in the operator's compartment and on a remote display that can be easily viewed by the Owner. D. Grout Sampling and Grout Cube Compression Tests:
    1. A qualified and independent testing laboratory shall be retained and compensated by the Contractor to perform required grout compression tests.
    2. Obtain and furnish brass or stainless-steel cube molds. Prepare cube specimens (2 inches x 2 inches x 2 inches) for sampling and testing in accordance with the provisions of ASTM C1107/C1107M, respectively. Prepare and cure grout cubes in accordance with ASTM C31, ASTM C942 and ASTM C1107/C1107M. Transport the cubes carefully to the laboratory and cure and test grout cubes in accordance with ASTM C1107/1107M and ASTM C109/C109M, as applicable.
    3. Furnish to the testing laboratory 6 test cubes for each 24 cubic yards of grout placed, with a minimum of 6 cubes for each day's placement, if less than 24 cubic yards are placed in a day. Owner may revise this frequency of obtaining and furnishing grout cubes throughout the course of construction, contingent upon Contractor providing uniform consistency of grout.
        a. Owner may reduce frequency to a minimum number of cubes not less than 2 sets of 6 test cubes per day to be obtained at Owner's discretion and generally represent one set of morning and one set of afternoon installation activities.
    4. The Owner may require additional grout sampling and testing from trucks where excessive water is added, or the temperature and/or consistency vary significantly from previously supplied batches for the purpose of confirming grout strength.
    5. Two cubes shall be tested in compression at each of the ages of 7 days, 28 days and two retained for testing at 56 days, if the need is so determined.

2.03 ELECTRONIC MEASUREMENT AND RECORDING EQUIPMENT:

A. Electronic measurement instrumentation shall be supplied by the Contractor to monitor CGE installation. The following measurements shall be recorded versus depth of the auger injection point at minimum 2-foot increments over the entire length of CGE installation:
    1. Installation tooling rotation speed (rpm).
    2. Depth of auger injection point (ft).
    3. Torque delivered to installation tooling (ft-lbs).
    4. Crowd force (lbs).
    5. Incremental and cumulative installation effort, or other torque-based feedback.
    6. Volume of grout for each foot of CGE (ft^3).
    7. Maximum and minimum grout pressures (psi).

B. Calibration shall be made on all measuring and recording equipment at the beginning of the project to demonstrate that the values indicated by the automated equipment are within 3% of the values reported in the output. Calibrations shall be performed in accordance with the equipment manufacturer's specifications. All measuring and recording equipment shall be recalibrated when the Owner suspects that the drilling and grouting performance has changed.

C. Digital records shall be made of all acquired data and made available in the format of raw output data from the monitoring equipment.

D. Grout pressure and grout volume shall be measured versus depth and time via magnetic flow meter.
E. Minimum specified grout ratio or volume per unit CGE length measurement shall be clearly displayed to guide the Contractor during CGE installation.
F. Monitoring equipment shall monitor rate of installation tooling rotation, and hydraulic torque drive pressures.
G. Data printout, in English units, shall include, at a minimum, the following:
    1. CGE name.
    2. Project name.
    3. Date of CGE installation.
    4. Start and stop time of drilling.
    5. Rate of installation tooling rotation vs. depth for every 5-foot increment, or less, of tooling advancement during the drilling process.
    6. Start and stop time of grouting
    7. Volume of grout placed and grout ratio versus depth for every 2-foot increment, or less, of CGE placed.
    8. Average maximum and minimum pump stroke pressures at ground level for every 2-foot increment, or less, of CGE placed.
    9. Angle of CGE installation

PART 3 - EXECUTION:

3.01 SITE PREPARATION:

A. Ground elevations and bottom of footing elevations shall be established by the Contractor in sufficient detail to estimate installation depth elevations to within 3 inches.
B. A working surface shall be established and maintained to provide wet weather protection of the subgrade and to provide access for efficient operation of the CGE installation.
C. Prior to, during and following CGE installation, provide positive drainage to protect the site from wet weather and surface ponding of water.
D. Stockpile spoil materials, as applicable, on site at a location designated by Owner.

3.02 FIELD MARKING AND ELEVATIONS:

A. Contractor shall provide real time depth monitoring for Owner or their representative.
B. Contractor shall provide ground surface elevation reference and mark stem at 1-foot intervals, beginning with installation tooling length at the top of tool and progressing to respectively higher numbers up the length of the stem, to permit determination of the CGE tip depth and elevation.
C. Survey and establish CGE locations in the field, with CGE number and type, and working surface elevation indicated on a pin, flag, or stake in accordance with the Drawings. Replace pins, flags or stakes when damaged during the course of the work.

3.03 CGE DRILLING:

A. A sufficient quantity of grout to complete the CGE shall be on site or in transit prior to the start of drilling.
B. Place the CGEs to the specified tip elevation or penetration. Place CGEs without excessive duration or delay in one continuous operation to the required cutoff elevation or higher, so as to

preclude the possibility of grout setting up prior to the completion of the CGE placement or cold joints forming in the CGE.

C. The installation tooling shall be positioned directly above the staked location, and the mast plumbed using the on-board inclinometer display. Plumbness of the mast shall be checked with a hand level once each day or if there is reason to question the plumbness of the mast.

D. The grout port at the tip of the installation tooling shall be plugged prior to drilling to preclude entrance of soil or water during drilling.

E. Initiate installation by allowing the weight of the suspended tools to bear on the ground surface and beginning rotation. Provide downward force (crowd) as needed to penetrate to the anticipated CGE tip elevations.

F. The use of pressure injection during drilling with water and/or compressed air will not be permitted.

G. Install with a stem system restrained from shifting while drilling.

3.04 CGE PENETRATION:

A. CGE tips shall penetrate into bearing layer and at the depth/elevation shown in the Contractor's design documents.

3.05 GROUT PLACEMENT

A. Upon reaching the required penetration, stop or reduce the rate of rotation. Lift the auger 6 inches and begin pumping cement-based grout under pressure through the hollow stem auger to establish a minimum of 5 feet of grout head above the tip of the auger. Carefully and slowly withdraw auger while pumping to maintain a grout head during withdrawal not less than 5 feet.

B. Place CGEs without excessive duration or delay in one continuous operation to the required cutoff elevation, so as to preclude the possibility of grout setting up prior to the completion of CGE placement or cold joints forming in the CGE.

C. If 5-foot of grout head is not observed (identified as the depth of the tip of the auger when fluid grout appears at the ground surface), the Contractor shall re-drill and re-grout the CGE to the full depth.

D. Auger shall be withdrawn at a smooth, continuous rate. If the auger jumps upward during withdrawal, if the grout pressure decreases, or if the grouting is interrupted for any reason, the auger shall be reinserted to a minimum of 5 feet below the tip depth of the auger when the interruption occurred or to the bottom of the CGE, whichever is less, and the rate of withdrawal shall be decreased to prevent further jumping or pressure decrease. Should any interruption in grouting exceed 30 minutes, Contractor shall re-drill the CGE to the termination depth and restart the grouting operation.

E. Should the auger or hose become plugged during grout placement that requires disconnection of the hose to locate and remove blockage, the CGE shall be rejected, and the pump and system will require repriming prior to resuming CGE installation. If blockage is successfully removed, a sufficient volume of grout equal to the grout volume required to prime the system shall be pumped through the system prior to resuming grouting.

F. Auger shall not be rotated counterclockwise as the auger is withdrawn.

G. Pumping shall be continued until the tip exits the ground surface.

H. The crane leads shall not be lifted until after the auger tip exits the ground surface.

I. Withdraw auger at a rate such that the cumulative grout factor for the total length of CGE shall not be less than 1.15. If any 5-ft increment of CGE is discovered to have a grout factor less

than 1.15, then re-drill the hole to a depth where all of the 5-foot intervals below this zone have a minimum grout factor of 1.15 and restart the grouting operation.

J. When using automated monitoring equipment, the grout factor shall be measured and maintained at 5-foot increments.

K. Adjustment of minimum grout factor may be approved by the Owner based on experience with test CGE installation, consistency of CGE installation technique, grout head and other factors.

L. If calculated quantities of grout volume placed indicate less volume than that calculated as necessary to complete the CGE in place with the minimum grout factors noted above, then redrill the hole to the original tip elevation and restart grouting operation.

M. Volume of grout placed will be as noted on the printout from the automated instrumentation and monitoring equipment, or calculated using the stroke count from a calibrated pump.

N. Equipment or materials made of aluminum shall not be used to transport, convey, form, or place grout.

O. The plan CGE cut-off elevation shall be established while the grout is fresh, unless otherwise directed. The exposed grout surface shall be screened to remove any spoils, and fresh grout removed from the top of the CGE until the approximate plan CGE cut-off elevation is established.

3.06 INSTALLATION TOLERANCE:

A. CGEs shall not exceed a variation from the vertical of more than 1/4-inch per foot of CGE length.

B. The center of the CGE head shall not vary from plan location at cutoff by more than 3 inches.

C. Acceptable tolerance in finished top of CGE elevation relative to that indicated shall not exceed plus or minus 1.0 inch. Contractor may elect to trim CGEs to cutoff elevation and construct the LTPs after installation of all of the CGEs is completed.

3.07 PROTECTION OF EXISTING STRUCTURES:

A. The Contractor is responsible for locating and protecting underground and aboveground utilities and other structures from damage during installation of the CGE system.

B. Protection of adjacent structures from damages due to the ground improvement work shall consider potential damages caused by settlement, vibration, and/or improper spacing of the ground improvement elements.

C. Contractor shall take appropriate corrective actions to prevent damage to adjacent structures, pavement, utilities, and other improvements.

D. Coordinate all excavations made subsequent to CGE installations so that sequence of excavations does not encroach on the structures as shown in the construction drawings. Protection of completed CGEs is the responsibility of the Contractor. In the event that utility excavations are required in close proximity to the installed CGE system, the Contractor shall coordinate with the Contractor's Professional Engineer immediately to develop construction solutions to minimize impacts on the installed CGE system.

3.08 QUALITY CONTROL:

A. The location of the CGE system for this project, including layout of individual CGEs, shall be marked in the field using survey stakes or similar means.

B. Contractor shall have a full-time, on-site Quality Control Technician to verify and report all installation procedures to verify that the production practices meet the design assumptions.

C. Contractor shall immediately report any unusual conditions encountered during installation. The quality control procedures shall include the preparation of Progress Reports completed during each day of installation.

D. The Owner may provide a full-time Geotechnical Representative for continuous observation during drilling operations.
   1. Presence of the full-time Geotechnical Representative does not relieve Contractor of their responsibility to complete the Work as specified and indicated.
   2. Observation may also include verification of the following:
      a. placement locations and plumbness,
      b. element diameters (if applicable),
      c. element lengths,
      d. strata at element's termination depth,
      e. volume of concrete or grout.

E. Contractor shall cooperate with Owner's Quality Assurance personnel.

3.09 COMPLETION OF CGE INSTALLATION

A. Contractor shall supply and operate surveying equipment for the determination of the specified elevations for the CGE top and all reinforcing steel elements.

B. Make all reasonable efforts to adjust the grout level to the plan CGE cut-off elevation while the grout is fresh. The exposed grout surface shall be screened to remove any spoils, and fresh grout removed from the top of the CGE until the plan CGE cutoff elevation is established.

C. Where the planned CGE cutoff elevation is at or above the working grade, or when CGE cutoff elevation is below grade and soils will not stand open without support, temporary casing (i.e. cans or sleeves) shall be installed around the CGE tops to reach the plan CGE cutoff elevation. The grout shall be screened and checked for contamination before and after the installation of the casing.
   1. Temporary casing may consist of steel casing, round fibre form, Sonotube, or formwork.
   2. Temporary steel casing shall have a minimum inside diameter equal to the plan diameter of the CGE.
   3. Temporary casing shall be of sufficient thickness and stiffness to restrain it from excessive deformation during grout placement and to provide adequate support to the entire required grout column during curing.
   4. Temporary casing shall be removed by Contractor prior to placing concrete for mats and/or grade beams.
   5. Contractor shall be responsible for structural adequacy of temporary casing.

D. Subsidence of fresh grout may occur. Monitor CGEs for a minimum of 2 hours after completion or longer if grout subsidence continues. Add grout to the CGE after completion as required to maintain the plan CGE cutoff elevation, but not after the grout surface has hardened to the point where a cold joint would be formed or where soil materials have fallen on top of the CGE.

E. When required, cut off CGEs by methods that shall not damage the grout of the CGE portion left in place.

F. Remove spoils generated by CGE installation activities and dispose of at an off-site location, or as otherwise designated by the Owner.

3.10 PROTECTION OF COMPLETED CGE INSTALLATION:

A. Do not install CGEs within the near vicinity to freshly placed CGEs until 12 hours have elapsed from time of placement or until the freshly placed CGEs have hardened sufficiently as to preclude the possibility of hydrostatic head causing the grout to break through to the hole being drilled, or pumping of grout to impact freshly placed CGEs.

B. Because of potential variations in Site conditions which may exist both in lateral extent and vertical depth, Contractor shall be responsible for determining:
   1. The time at which CGEs have hardened sufficiently if less than 24 hours, and
   2. The minimum acceptable radial distance to which a new CGE can be placed within the near vicinity to freshly placed CGEs.

C. The acceptable radial distance, whether to an immediately adjacent CGE or CGE in close proximity, shall not under any circumstances be less than six (6) CGE diameters in a radial direction from the centerline of freshly placed CGEs.

D. If a freshly placed CGE breaks through to the hole being drilled, regardless of time for curing or radial distance, the freshly placed CGE breaking through will be rejected immediately, and Contractor shall be responsible for replacement of the rejected CGE(s) along with the following:
   1. The hole being drilled shall be re-drilled and completed; and
   2. The CGE to break through shall be brought back up to grade with fresh grout.

E. Any concentrated loads from equipment must be distributed to prevent compressing or shearing the soil in the top area of the CGEs. Concentrated loads must be kept at least 10 feet away from the CGE until final set of the grout has occurred.

F. Prevent all debris and foreign material from falling into fresh grout.

G. Provide hot weather protection to grout mix, installation equipment during placement, and fresh grout during curing in conformance with ACI 305.1, or as directed by Contractor's Professional Engineer and approved by Owner.

H. Provide cold weather protection to grout mix and installation equipment during placement to prevent installation of grout less than 40° F in accordance with ACI 306.1.

I. Provide cold weather protection to all exposed surfaces of fresh grout during curing in conformance with ACI 306.1 or as directed by Contractor's Professional Engineer and approved by Owner.

3.11 LOAD-TRANSFER PLATFORM INSTALLATION

A. Install Load-Transfer Platform (LTP) in accordance with Contractor's Professional Engineer's approved design.

B. LTP soil material shall be free of debris, roots, frozen matter, organic matter, or other deleterious material.

C. LTP soil material shall be placed in lifts not to exceed 8 inches thick and meet the compaction and moisture content requirements of the design.

D. Compaction and moisture content measurements shall be made at the following frequency:
   1. Footings: once per lift
   2. Walls: once every 30 linear feet.

E. If applicable, geosynthetic reinforcement shall be free of damage and installed in accordance with the manufacturer's recommendations.

F. Protect the completed LTP from damage.

3.12 OBSTRUCTIONS

A. An obstruction is defined as a specific object encountered during the installation of a CGE which prevents the advance of the CGE. Obstructions may include boulders, cobbles, logs, concrete, bricks, abandoned foundations or utility lines, or other man-made objects.
B. When efforts to advance past the obstruction prevent placement of the element to the required depth or cause the element to drift from the required location, then the Contractor shall either abandon and relocate the element, or remove the obstruction using specialized techniques, as appropriate for the conditions encountered.
C. When obstructions are encountered, the Contractor shall immediately notify the Owner.

3.13 NON-CONFORMING WORK:

A. Contractor shall be solely responsible for full compliance with the Contract Documents regardless of if and when discrepancies are brought to their attention. Contractor shall be responsible for all re-work necessary to achieve full compliance with the Contract Documents. Repairs or replacement shall be at the sole expense of the Contractor, including the costs to redesign, as required.
B. Owner may employ one or more of their representatives for observation and testing services.
C. Owner may reject any shafts which, in their opinion, do not conform to the Contract Documents.
D. CGEs installed beyond the maximum allowable tolerances or otherwise not in accordance with this specification shall be abandoned and replaced with new elements. All material and labor required to replace rejected CGEs shall be provided at no additional cost to the Owner.

END OF SECTION 31 66 12

SECTION 32 12 17 – HOT-MIX ASPHALT-CONCRETE PAVEMENT

PART 1- GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. Section Includes:
   1. Hot-mix asphalt paving.

1.03 SECTION REQUIREMENT

A. Product Data and hot mix asphalt design mixes
B. Provide hot-mix asphalt paving according to standard specifications of the Missouri Department of Transportation.
C. Asphalt-Paving Publication: Comply with MS-22, "Construction of Hot Mix Asphalt Pavements," unless more stringent requirements are indicated.

1.04 DEFINITION

A. Hot-Mix Asphalt Paving Terminology: Refer to ASTM D 8 for definitions of terms.

1.05 SUBMITTALS

A. Product Data: For each type of product indicated. Include technical data and tested physical performance properties.
   1 Job-Mix Designs: Certification, by authorities having jurisdiction, of approval of each job mix proposed for the Work.
   2. Job-Mix Designs: For each job mix proposed for the Work.
   3. Material Certificate: For each paving material, from manufacturer.

1.06 QUALITY ASSURANCER

A. Manufacturer Qualifications: A paving-mix manufacturer registered with and approved by authorities having jurisdiction or the MoDOT of state in which Project is located.

1.07 PROJECT CONDITIONS:

A. Environmental Limitations: Do not apply asphalt materials if subgrade is wet or excessively damp, if rain is imminent or expected before time required for adequate cure, or if the following conditions are not met:
   1. Prime Coat: Minimum surface temperature of 60 deg F
   2. Tack Coat: Minimum surface temperature of 60 deg F
   3. Slurry Coat: Comply with weather limitations in ASTM D 3910.
   4. Asphalt Base Course: Minimum surface temperature of 40 deg F and rising at time of placement.
   5. Asphalt Surface Course: Minimum surface temperature of 60 deg F at time of placement.
B. Pavement-Marking Paint: Proceed with pavement marking only on clean, dry surfaces and at a minimum ambient or surface temperature of 40 deg F for oil-based materials, 55 deg F for water-based materials, and not exceeding 95 deg F.

C. Imprinted Asphalt Paving: Proceed with coating imprinted pavement only when air temperature is at least 50 deg F and rising and will not drop below 50 deg F within 8 hours of coating application. Proceed only if no precipitation is expected within two hours after applying the final layer of coating.

PART 2 - PRODUCTS

2.01 AGGREGATES

A. General: Use materials and gradations that have performed satisfactorily in previous installations.
B. Coarse Aggregate: Per Missouri Department of Transportation Specification Section 1002.
C. Fine Aggregate: Per Missouri Department of Transportation Specification Section 1002.
D. 6 inch base course of limestone, such as MoDOT Type 5, be placed below all new pavements.

2.02 ASPHALT MATERIALS

A. Asphalt Binder: AASHTO M 320 or AASHTO MP 1a, per APWA. Provide Asphalt Binder that complies with Missouri Department of Transportation Specifications Section. Post a legible copy of the latest bill of lading for the Asphalt Binder on or near the gyratory compactor. Use the mixing and compaction temperatures shown on the bill of lading; however, the maximum mixing or compaction temperature is 340ºF, unless otherwise approved by the Bureau Chief of Materials and Research. Notify the Engineer if the mixing or compaction temperature changes.
B. Asphalt Cement: ASTM D 3381 for viscosity-graded material or ASTM D 946 for penetration-graded material.
C. Tack Coat: ASTM D 977 emulsified asphalt, slow setting, diluted in water, of suitable grade and consistency for application.
D. Water: Potable.

2.03. AUXILIARY MATERIALS

A. Herbicide: Commercial chemical for weed control, registered by the EPA. Provide in granular, liquid, or wettable powder form.
B. Pavement-Marking Paint: Latex, waterborne emulsion, lead and chromate free, ready mixed, complying with FS TT-P-1952, Type II, with drying time of less than 45 minutes.
Color: White.
C. Wheel Stops: Precast, air-entrained concrete, 2500-psi minimum compressive strength, 7 inches high by 8 inches wide by 72 inches long. Provide chamfered corners, drainage slots on underside, and holes for anchoring to substrate.
    1. Dowels: Galvanized steel, 3/4-inch diameter, 10-inch minimum length.

2.04. MIXES

A. Hot-Mix Asphalt: Dense, hot-laid, hot-mix asphalt plant mixes approved by authorities having jurisdiction; designed according to procedures in AIMS-2, "Mix Design Methods for Asphalt Concrete and Other Hot-Mix Types"; and complying with the following requirements:
    1. Base Course: Per Missouri Department of Transportation Specification Section 304 Aggregate Base Course.
    2. Surface Course: Per Missouri Department of Transportation Specification Section 310 Aggregate Surface Course.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that subgrade is dry and in suitable condition to begin paving.
B. Proceed with paving only after unsatisfactory conditions have been corrected.
C. Roof-roll subgrade below pavements with heavy pneumatic-tired equipment to identify soft pockets and areas of excess yielding. Do not proof-roll wet or saturated subgrades.
D. Proceed with paving only after unsatisfactory conditions have been corrected.
E. Verify that utilities, traffic loop detectors, and other items requiring a cut and installation beneath the asphalt surface have been completed and that asphalt surface has been repaired flush with adjacent asphalt prior to beginning installation of imprinted asphalt.
    1. Excavate and trim unbound-aggregate base course, if encountered, and keep material separate from milled hot-mix asphalt.
    2. Transport milled hot-mix asphalt to asphalt recycling facility.
    3. Keep milled pavement surface free of loose material and dust.

3.02. SURFACE PREPARATION

A. General: Immediately before placing asphalt materials, remove loose and deleterious material from substrate surfaces. Ensure that prepared subgrade is ready to receive paving.
B. Herbicide Treatment: Apply herbicide according to manufacturer's recommended rates and written application instructions. Apply to dry, prepared subgrade or surface of compacted-aggregate base before applying paving materials.
    1. Mix herbicide with prime coat if formulated by manufacturer for that purpose
C. Tack Coat: Apply uniformly to surfaces of existing pavement at a rate of 0.05 to 0.15 gal./sq. yd.
    1. Allow tack coat to cure undisturbed before applying hot-mix asphalt paving.
    2. Avoid smearing or staining adjoining surfaces, appurtenances, and surroundings. Remove spillages and clean affected surfaces.

3.03 HOT-MIX ASPHALT PLACING

A. Machine place hot-mix asphalt on prepared surface, spread uniformly, and strike off. Place asphalt mix by hand to areas inaccessible to equipment in a manner that prevents segregation of mix. Place each course to required grade, cross section, and thickness when compacted.
    1. Spread mix at minimum temperature of 265 deg F.
    2. Regulate paver machine speed to obtain smooth, continuous surface free of pulls and tears in asphalt-paving mat.
B. Place paving in consecutive strips not less than 10 feet wide unless infill edge strips of a lesser width are required.
    1. After first strip has been placed and rolled, place succeeding strips and extend rolling to overlap previous strips. Complete a section of asphalt base course before placing asphalt surface course.
C. Promptly correct surface irregularities in paving course behind paver. Use suitable hand tools to remove excess material forming high spots. Fill depressions with hot-mix asphalt to prevent segregation of mix; use suitable hand tools to smooth surface.

3.04 JOINTS

A. Construct joints to ensure a continuous bond between adjoining paving sections. Construct joints free of depressions, with same texture and smoothness as other sections of hot-mix asphalt course.
   1. Clean contact surfaces and apply tack coat to joints.
   2. Offset longitudinal joints, in successive courses, a minimum of 6 inches.
   3. Offset transverse joints, in successive courses, a minimum of 24 inches.
   4. Construct transverse joints at each point where paver ends a day's work and resumes work at a subsequent time. Construct these joints using "bulkhead" method according to AI MS-22, for both "Ending a Lane" and "Resumption of Paving Operations."
   5. Compact joints as soon as hot-mix asphalt will bear roller weight without excessive displacement.
   6. Compact asphalt at joints to a density within 2 percent of specified course density.

3.05 COMPACTION

A. General: Begin compaction as soon as placed hot-mix paving will bear roller weight without excessive displacement. Compact hot-mix paving with hot, hand tampers or with vibratory-plate compactors in areas inaccessible to rollers. Complete compaction before mix temperature cools to 185 degree F.

B. Breakdown Rolling: Complete breakdown or initial rolling immediately after rolling joints and outside edge. Examine surface immediately after breakdown rolling for indicated crown, grade, and smoothness. Correct laydown and rolling operations to comply with requirements.

C. Intermediate Rolling: Begin intermediate rolling immediately after breakdown rolling while hot-mix asphalt is still hot enough to achieve specified density. Continue rolling until hot-mix asphalt course has been uniformly compacted to the following density:
   1. Average Density: 96 percent of reference laboratory density according to ASTM D 6927, but not less than 94 percent nor greater than 100 percent.
   2. Average Density: 92 percent of reference maximum theoretical density according to ASTM D 2041, but not less than 90 percent nor greater than 96 percent.

D. Finish Rolling: Finish roll paved surfaces to remove roller marks while hot-mix asphalt is still warm.

E. Edge Shaping: While surface is being compacted and finished, trim edges of pavement to proper alignment. Bevel edges while asphalt is still hot; compact thoroughly.

F. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened.

G. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

3.06 INSTALLATION TOLERANCES

A. Pavement Thickness: Compact each course to produce the thickness indicated within the following tolerances:
   1. Base Course: Plus or minus 1/2 inch.
   2. Surface Course: Plus 1/4 inch, no minus.

B. Pavement Surface Smoothness: Compact each course to produce a surface smoothness within the following tolerances as determined by using a 10-foot straightedge applied transversely or longitudinally to paved areas:

1. Base Course: 1/4 inch.
2. Surface Course: 1/8 inch.
3. Crowned Surfaces: Test with crowned template centered and at right angle to crown. Maximum allowable variance from template is 1/4 inch.

3.07 PAVEMENT MARKING

A. White pavement-marking paint shall apply

B. Sweep and clean surface to eliminate loose material and dust.

C. Apply paint with mechanical equipment to produce pavement markings, of dimensions indicated, with uniform, straight edges. Apply at manufacturer's recommended rates to provide a minimum wet film thickness of 15 mils.

3.08 WHEEL STOPS

A. Retain this article if wheel stops are required.

B. Install wheel stops in bed of adhesive as recommended by manufacturer.

C. Securely attach wheel stops to pavement with not less than two galvanized-steel dowels embedded at one-quarter to one-third points. Securely install dowels into pavement and bond to wheel stop. Recess head of dowel beneath top of wheel stop.

3.09 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Thickness: In-place compacted thickness of hot-mix asphalt courses will be determined according to ASTM D 3549.

C. Surface Smoothness: Finished surface of each hot-mix asphalt course will be tested for compliance with smoothness tolerances.

D. In-Place Density: Testing agency will take samples of uncompacted paving mixtures and compacted pavement according to ASTM D 979.

1. Reference maximum theoretical density will be determined by averaging results from four samples of hot-mix asphalt-paving mixture delivered daily to site, prepared according to ASTM D 2041, and compacted according to job-mix specifications.
2. In-place density of compacted pavement will be determined by testing core samples according to ASTM D 1188 or ASTM D 2726.
    a. One core sample will be taken for every 1000 sq. yd. or less of installed pavement, with no fewer than 3 cores taken.
    b. Field density of in-place compacted pavement may also be determined by nuclear method according to ASTM D 2950 and correlated with ASTM D 1188 or ASTM D 2726.

E. Replace and compact hot-mix asphalt where core tests were taken.

F. Remove and replace or install additional hot-mix asphalt where test results or measurements indicate that it does not comply with specified requirements.

3.10 DISPOSAL

A. Except for material indicated to be recycled, remove excavated materials from Project site and legally dispose of them in an EPA-approved landfill.

1. Do not allow milled materials to accumulate on-site.

END OF SECTION 32 12 17

SECTION 32 15 00 – AGGREGATE SURFACE COURSE

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and DIVISION 01 Specification Sections, apply to this Section.

B. Refer to MoDOT DIVISION 300

1.02 SUMMARY

A. This Section includes requirements for aggregate surfacing for roads, streets, parking areas, and other surfaces requiring aggregate surfacing.

1.03 RELATED REQUIREMENTS

A. Section 31 20 50 - Site Preparation and Earthwork.

1.04 REFERENCE STANDARDS

A. The publications listed below form a part of this Specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1. American Society for Testing and Material (ASTM): Equivalent AASHTO Standards may be substituted as approved:
   a. ASTM C117 - Standard Test Method for Materials Finer than 75-µm (No. 200) Sieve in Mineral Aggregates by Washing.
   b. ASTM C131 - Standard Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine.
   c. ASTM C136 - Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.
   d. ASTM D75/D75M - Standard Practice for Sampling Aggregates.
   e. ASTM D422 - Particle-Size Analysis of Soils.
   f. ASTM D698 - Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft^3).
   g. ASTM D1557 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3).
   h. ASTM D2167 - Density and Unit Weight of Soil in Place by the Rubber Balloon Method.
   i. ASTM D4318 - Liquid Limit, Plastic Limit, and Plasticity Index of Soils.
   j. ASTM D6938 - Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).
2. State of Missouri Standard Specifications for State Road and Bridge Construction.

1.05 QUALITY ASSURANCE

A. Sampling and testing is the responsibility of the Contractor. Submit copies of field test results within 24 hours after the tests are performed. Test results from samples, not less than 30 days before material is required for the Work. Results of laboratory tests for quality control purposes, for approval, prior to using the material. Sampling and testing shall be performed by an approved commercial testing laboratory or by the Contractor, subject to approval. If the Contractor elects to establish its own testing facilities, approval of such facilities will be based on compliance with ASTM D3740.

1.06 WEATHER LIMITATIONS

Aggregate surface courses shall not be constructed when the ambient temperature is below 35ºF (2ºC) or on subgrades that are frozen or contain frost. Surfaces damaged by freeze, rainfall, or other weather conditions shall be brought to a satisfactory condition by the Contractor.

PART 2 - PRODUCTS

2.01 AGGREGATES

A. Provide aggregates consisting of clean, sound, durable particles of crushed limestone or crushed natural gravels, or other approved materials processed and blended or naturally combined. Provide aggregates free from lumps and balls of clay, organic matter, objectionable coatings, and other foreign materials. The Contractor is responsible for obtaining materials that meet the specification and can be used to meet the grade and smoothness requirements specified herein after all compaction [and proof rolling] operations have been completed.

B. The gravel road shall be a total of 8 inches. The base course shall be AB3 and the subsurface course shall be ¾ inch aggregate.

C. The gradation for the base course and the surface course shall be in accordance with the following table:

Sieve Size	Mass Percent Passing		
	SA1 (surface) or SA2 (surface)		AB3 (sub course)
Type	Sand-Gravel	Sand-Gravel	
2 inch			0
1 ½ inch		0	0-5
1 ¼ inch			
1 inch	0	1-15	
¾ inch	0-5		5-30
½ inch			
3/8 inch	0-20		
No. 4			35-60
No. 8			45-70
No. 10			
No. 30			
No. 40			60-84
No. 200			80-92
Fineness Module	4 min	5 min	

D. Refer to the typical section in drawing for gravel road

E. Contractor's facilities have been inspected and approved.

F. Sampling:

1. Take samples for material gradation, liquid limit, and plastic limit tests in conformance with ASTM D75/D75M.

G. Testing:
    1. Gradation:
        a. Aggregate gradation shall be in conformance with ASTM C33,size 67 for ¾ inch maximum size consisting of crushed gravel or crushed stone.

PART 3 - EXECUTION

3.01 STOCKPILING MATERIALS

A. Prior to stockpiling the material, clear and level the storage areas. All materials, including approved material available from excavation and grading, shall be stockpiled in the manner and at the locations designated. Stockpile aggregates in such a manner that will prevent segregation. Aggregates and binders obtained from different sources shall be stockpiled separately.

3.02 PREPARATION OF SUBGRADE

A. Clean of all foreign substances from the subgrade. At the time of surface course construction, the subgrade shall contain no frozen material. The existing roads are in poor shape and will need to be hit with the road grader and crowned. Ruts or soft yielding spots in the subgrade areas having inadequate compaction and deviations of the surface from the requirements set forth herein shall be corrected by loosening and removing soft or unsatisfactory material and by adding approved material, reshaping to line and grade and recompacting to density requirements specified. The completed subgrade shall not be disturbed by traffic or other operations and shall be maintained by the Contractor in a satisfactory condition until the surface course is placed.

3.03 MIXING AND PLACING MATERIALS

A. The materials shall be mixed and placed to obtain uniformity of the material and a uniform optimum water content for compaction. Make adjustments in mixing, placing procedures, or in equipment to obtain the true grades, to minimize segregation and degradation, to obtain the desired water content, and to ensure a satisfactory surface course.

3.04 LAYER THICKNESS

A. Place the aggregate material on the subgrade in layers of uniform thickness. When a compacted layer of 2 inches, the material may be placed in a single layer; when a compacted thickness of more than 2 inches, no layer shall exceed 4 inches nor be less than 3 inches when compacted.

3.05 COMPACTION

A. Degree of compaction is a percentage of the maximum density obtained by the test procedure presented in ASTM D698. Compact each layer of the aggregate surface course with approved compaction equipment, as required in the following paragraphs. The water content during the compaction procedure shall be maintained within 1.5% of optimum. In locations not accessible to the rollers, the mixture shall be compacted with mechanical tampers. Compaction shall continue until each layer through the full depth is compacted to at least 100% of laboratory maximum density. Remove any materials that are found to be unsatisfactory and replace them with satisfactory material or rework them to produce a satisfactory material.

3.06 EDGES OF AGGREGATE-SURFACED ROAD

A. Approved material shall be placed along the edges of the aggregate surface course in such quantity as to compact to the thickness of the course being constructed. When the course is being constructed in two or more layers, at least 1 foot (300 mm) of shoulder width shall be rolled and compacted simultaneously with the rolling and compacting of each layer of the surface course.

3.07 GRADE CONTROL

A. During construction, the lines and grades including crown and cross slope indicated for the aggregate surface course shall be maintained by means of line and grade stakes placed by the Contractor.

3.08 DENSITY TESTS

A. Frequency of tests shall be a minimum of one test for every 2,500 square feet. Measure density in the field in accordance with ASTM D2167.

3.09 MAINTENANCE

A. Maintain the aggregate surface course in a condition that will meet all specification requirements until accepted.

END OF SECTION 32 15 00

SECTION 32 16 00 – CURBS, GUTTERS, SIDEWALKS, MEDIAN AND PAVED DRAINAGE

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

A. This Section includes concrete curbs, gutters, sidewalks, and paved drainage where indicated.
B. Related Sections include the following:
    1. Section- 31 20 50- Site Preparation and Earthwork.

1.03 DEFINITIONS

A. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash and other pozzolans, and ground granulated blast-furnace slag.

1.04 SUBMITTALS

A. Product Data: For each type of manufactured material and product indicated.
B. Design Mixtures: For each concrete pavement mixture. Include alternate mixture designs when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.
C. Qualification Data: For manufacturer. Manufacturer of ready-mixed concrete products complying with ASTM C 94 requirements for production facilities and equipment.
D. Material Test Reports: General contractor will engage a qualified testing agency for indicating and interpreting test results for compliance of the following with requirements indicated, based on comprehensive testing of current materials:
    1. Aggregates. Include service record data indicating absence of deleterious expansion of concrete due to alkali-aggregate reactivity.
E. Material Certificates: Signed by manufacturers certifying that each of the following materials complies with requirements:
    1. Cementitious materials.
    2. Steel reinforcement and reinforcement accessories.
    3. Fiber reinforcement.
    4. Admixtures.
    5. Curing compounds.
    6. Applied finish materials.
    7. Bonding agent or epoxy adhesive.
    8. Joint fillers.
F. Field quality-control test reports.
G. For places and sidewalks, submit control joint spacing plan for review.
H. Minutes of pre-installation conference.

1.05 QUALITY ASSURANCE

A. Manufacturer Qualifications: Manufacturer of ready-mixed concrete products who complies with ASTM C 94 requirements for production facilities and equipment.
    1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities."

B. Testing Agency Qualifications: An independent agency qualified according to ASTM C 1077 and ASTM E 329 for testing indicated, as documented according to ASTM E 548.
    1. Personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-01 or an equivalent certification program.

C. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixtures.

D. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
    1. Build mockups of full-thickness sections of concrete paving to demonstrate typical joints; surface finish, texture, and color; curing; and standard of workmanship.
    2. Build mockups of concrete paving in the location and of the size indicated or, if not indicated, build mockups where directed by Architect and not less than 96 inches by 96 inches.
    3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
    4. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

E. Pre-Installation Conference: Conduct conference at Project site to comply with requirements in Division 01 Section "Project Management and Coordination."
    1. Before submitting design mixtures, review concrete pavement mixture design and examine for ensuring quality of concrete materials and concrete pavement construction practices. Require representatives, including the following, of each entity directly concerned with concrete pavement, to attend conference:
        a. Contractor's superintendent.
        b. Independent testing agency responsible for concrete design mixtures.
        c. Ready-mix concrete producer.
        d. Concrete pavement subcontractor.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
    1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products specified.
    2. Products: Subject to compliance with requirements, provide one of the products specified.
    3. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.
    4. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.02 FORMS OF MATERIALS

A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces.
    1. Use flexible or curved forms for curves with a radius 100 feet or less.
B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.

2.03 STEEL REINFORCEMENT

A. Plain-Steel Welded Wire Reinforcement: ASTM A 185, fabricated from as-drawn steel wire into flat sheets.
B. Reinforcing Bars: ASTM A 615/A 615M, Grade 60; deformed.
C. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized after fabrication and bending; with ASTM A 615/A 615M, Grade 60 deformed bars.
D. Joint Dowel Bars: Plain steel bars, ASTM A 615/A 615M, Grade 60. Cut bars true to length with ends square and free of burrs.
E. Tie Bars: ASTM A 615/A 615M, Grade 60, deformed.
F. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded wire reinforcement, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice" from steel wire, plastic, or precast concrete of greater compressive strength than concrete, and as follows:
    1. Equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.
    2. For epoxy-coated reinforcement, use epoxy-coated or other dielectric-polymer-coated wire bar supports.

J. Zinc Repair Material: ASTM A 780.

2.04 CONCRETE MATERIALS

A. Materials: All materials including but not limited to reinforcing materials, concrete materials, concrete mix, admixtures, curing materials, traffic paint and other related materials used under this section shall conform to the requirements of the State of Maryland Standard Specifications for Construction and Materials. References to a required class of concrete shall correspond to the classes as shown in the State of Maryland Standard Specifications for Construction and Materials Part II, Technical Requirements.

B. Fly ash shall meet the approval of the ASTM C-618 pozzolan Class F and may be used as a partial substitute for cement when approved by the City.

C. The concrete mix used in performing this work shall be per MDSHA mix designs depending on the compressive strength shown on the details and shall meet the approval of the City.

D. The concrete temperature shall not exceed 90°F when delivered to the job-site or at any time prior to placement in the forms.

E. Type I - Portland Cement: Shall be used from October 1 through May 1 and when the air temperature in the shade and away from artificial heat is above 70°F or less, or as directed by the Architect.

F. Type II - Portland Cement: Shall be used from May 1 through October 1 and when the air temperature in the shade and away from artificial heat is above 70°F, or as directed by the Architect.

G. When approved by the Architect, Hi-Early strength concrete may be used. Approval will be on a case by case basis.

H. Water: ASTM C 94/C 94M.

I. Air-Entraining Admixture: ASTM C 260.

J. Chemical Admixtures: Admixtures may only be use with prior approval by the City. Provide admixtures certified by manufacturer to be compatible with other admixtures and to contain not more than 0.1 percent water-soluble chloride ions by mass of cementitious material.

1. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
2. Retarding Admixture: ASTM C 494/C 494M, Type B.
3. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
4. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
5. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.

2.05 CURING MATERIALS

A. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. dry.

B. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
C. Water: Potable.
D. Evaporation Retarder: Waterborne, monomolecular film forming; manufactured for application to fresh concrete.
    1. Available Products:
        - Axim Concrete Technologies; Cimfilm.
        - Burke by Edeco; BurkeFilm.
        - ChemMasters; Spray-Film.
        - Conspec Marketing & Manufacturing Co., Inc.; Aquafilm.
        - Dayton Superior Corporation; Sure Film.
        - Euclid Chemical Company (The); Eucobar.
        - Kaufman Products, Inc.; Vapor Aid.
        - Lambert Corporation; Lambco Skin.
        - L&M Construction Chemicals, Inc.; E-Con.
        - MBT Protection and Repair, ChemRex Inc.; Confilm.
        - Meadows, W. R., Inc.; Sealtight Evapre.
        - Metalcrete Industries; Waterhold.
        - Nox-Crete Products Group, Kinsman Corporation; Monofilm.
        - Sika Corporation, Inc.; SikaFilm.
        - Symons Corporation; Finishing Aid.
        - Vexcon Chemicals, Inc.; Certi-Vex EnvioAssist.
E. White Waterborne Membrane-Forming Curing Compound: ASTM C 309, Type 2, Class B.
    1. Available Products:
        - Anti-Hydro International, Inc.; AH Curing Compound #2 WP WB.
        - Burke by Edoco; Resin Emulsion White.
        - ChemMasters; Safe-Cure 2000.
        - Conspec Marketing & Manufacturing Co., Inc.; W.B. Resin Cure.
        - Dayton Superior Corporation; Day-Chem White Pigmented Cure (J10W).
        - Euclid Chemical Company (The); Kurez VOX White Pigmented.
        - Kaufman Products, Inc.; Thinfilm 450.
        - Lambert Corporation; Aqua Kure-White.
        - L&M Construction Chemicals, Inc.; L&M Cure R-2.
        - Meadows, W. R., Inc.; 1200-White.
        - Symons Corporation; Resi-Chem White.
        - Tamms Industries, Inc.; Horncure 200-W.
        - Unitex; Hydro White.
        - Vexcon Chemicals, Inc.; Certi-Vex Enviocure White 100.

2.06 RELATED MATERIALS

A. Expansion- and Isolation-Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber or pre-molded wood fiber strips (Homex 300) or ASTM D 1752, cork or self-expanding cork.

B. Bonding Agent: ASTM C 1059, Type II, non-redispersible, acrylic emulsion or styrene butadiene.

C. Epoxy Bonding Adhesive: ASTM C 881, two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class suitable for application temperature and of grade to requirements, and as follows:

1. Types IV and V, load bearing, for bonding hardened or freshly mixed concrete to hardened concrete.

D. Chemical Surface Retarder: (For exposed aggregate concrete) Water-soluble, liquid-set retarder with color dye, for horizontal concrete surface application, capable of temporarily delaying final hardening of concrete to a depth of 1/8 to 1/4 inch

1. Products:
   a. Burke by Edeco; True Etch Surface Retarder.
   b. ChemMasters; Exposee.
   c. Conspec Marketing & Manufacturing Co., Inc.; Delay S.
   d. Euclid Chemical Company (The); Surface Retarder S.
   e. Kaufman Products, Inc.; Expose.
   f. Metalcrete Industries; Surftard.
   g. Nox-Crete Products Group, Kinsman Corporation; Crete-Nox TA.
   h. Scofield, L. M. Company; Lithotex.
   i. Sika Corporation, Inc.; Rugasol-S.
   j. Vexcon Chemicals, Inc.; Certi-Vex Envioset.

2.07 CONCRETE MIXTURES

A. Prepare design mixtures, proportioned according to ACI 301, for each type and strength of normal-weight concrete determined by either laboratory trial mixes or field experience.

1. Use a qualified independent testing agency for preparing and reporting proposed concrete mixture designs for the trial batch method.

B. Proportion mixtures to provide normal-weight concrete with the following properties:

1. Compressive Strength (28 Days): Minimum compressive strength of 3,000 psi where not indicated
2. Maximum Water-Cementitious Materials Ratio at Point of Placement: 0.50.
3. Slump Limit: 2-5, plus or minus 1 inch.

C. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight concrete at point of placement having an air content as follows:

1. Air Content: 6 percent plus or minus 1.5 percent for 1-inch nominal maximum aggregate size.

D. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.

E. Chemical Admixtures: Use admixtures according to manufacturer's written instructions.
    1. Use water-reducing admixture, plasticizing and retarding admixture in concrete, as required, for placement and workability.
    2. Use water-reducing and retarding admixture when required by high temperatures, low humidity, or other adverse placement conditions.

F. Cementitious Materials: Limit percentage, by weight, of cementitious materials other than Portland cement according to ACI 301 requirements for concrete exposed to deicing chemicals. Limits shall be as follows per MD SHA requirements:
    1. Fly Ash or Pozzolan: 25 percent.
    2. Ground Granulated Blast-Furnace Slag: 50 percent.

G. Combined Fly Ash or Pozzolan, and Ground Granulated Blast-Furnace Slag: 50 percent, with fly ash or pozzolan not exceeding 25 percent.

H. Synthetic Fiber: Uniformly disperse in concrete mix at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd..

2.08 CONCRETE MIXING

A Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M and ASTM C 1116 where synthetic fibers are noted on the plans. Furnish batch certificates for each batch discharged and used in the Work.
    1. When air temperature is between 85 deg F and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

2.09 PAVEMENT MARKINGS

A. Pavement-Marking Paint: Alkyd-resin type, lead and chromate free, ready mixed, complying with AASHTO M 248, Type N; colors complying with FS TT-P-1952.
    1. Color: White

PART 3 – EXECUTION

3.01 EXAMINATION

A. Examine exposed subgrades and subbase surfaces for compliance with requirements for dimensional, grading, and elevation tolerances.

B. Proof-roll prepared subbase surface below concrete pavements with heavy pneumatic-tired equipment to identify soft pockets and areas of excess yielding.
    1. Completely proof-roll subbase in one direction and repeat in perpendicular direction. Limit vehicle speed to 3 mph.
    2. Proof-roll with a loaded 10-wheel tandem-axle dump truck weighing not less than 1 5 tons.
    3. Subbase with soft spots and areas of pumping or rutting exceeding depth of 1/2 inch require correction.

C. Proceed with concrete pavement operations only after nonconforming conditions have been corrected and subgrade is ready to receive pavement.

3.02 PREPARATION

A. Remove loose material from compacted subbase surface immediately before placing concrete.

3.03 EDGE FORMS AND SCREED CONSTRUCTION

A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for pavement to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least 24 hours after concrete placement.
B. Clean forms after each use and coat with form-release agent to ensure separation from concrete without damage.

3.04 STEEL REINFORCEMENT

A. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
B. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.
C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.
D. Install welded wire reinforcement in lengths as long as practicable. Lap adjoining pieces at least one full mesh, and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
E. Install fabricated bar mats in lengths as long as practicable. Handle units to keep them flat and free of distortions. Straighten bends, kinks, and other irregularities, or replace units as required before placement. Set mats for a minimum 2-inch overlap of adjacent mats.

3.05 JOINTS

A. General: Form construction, isolation, and contraction joints and tool edgings true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated.
    1. When joining existing pavement, place transverse joints to align with previously placed joints, unless otherwise indicated.
B. Construction Joints: Set construction joints at side and end terminations of pavement and at locations where pavement operations are stopped for more than one-half hour unless pavement terminates at isolation joints.
    1. Continue steel reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of pavement strips, unless otherwise indicated.
    2. Provide tie bars at sides of pavement strips where indicated.

3. Butt Joints: Use bonding agent at joint locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
4. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or asphalt-coat one-half of dowel length to prevent concrete bonding to one side of joint.

C. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, walks, other fixed objects, and where indicated.
1. Locate expansion joints at intervals of 20 feet, unless otherwise indicated.
2. Extend joint fillers full width and depth of joint.
3. Terminate joint filler not less than 1/2 inch or more than 1 inch below finished surface if joint sealant is indicated.
4. By default, all isolation joints are scheduled to receive joint sealant. If joint sealant is specifically indicated as not required, place top of joint filler flush with finished concrete surface.
5. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
6 Protect top edge of joint filler during concrete placement with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.

D. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated for standard sidewalks. For larger sidewalks, width greater than 12' and plazas, submit shop drawing of joint pattern. Construct contraction joints for a depth equal to at least one-fourth of the concrete thickness, as follows:
1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with grooving tool to a 3/8-inch radius. Repeat grooving of contraction joints after applying surface finishes. Eliminate groove marks on concrete surfaces.
2. Doweled Contraction Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or asphalt coat one-half of dowel length to prevent concrete bonding to one side of joint.

3.06 CONCRETE PLACEMENT

A. Inspection: Before placing concrete, inspect and complete formwork installation, steel reinforcement, and items to be embedded or cast in. Notify other trades to permit installation of their work.
B. Remove snow, ice, or frost from subbase surface and reinforcement before placing concrete. Do not place concrete on frozen surfaces.
C. Moisten subbase to provide a uniform dampened condition at time concrete is placed. Do not place concrete around manholes or other structures until they are at required finish elevation and alignment.

D. Comply with ACI 301 requirements for measuring, mixing, transporting, and placing concrete.
E. Do not add water to fresh concrete after testing.
F. Deposit and spread concrete in a continuous operation between transverse joints. Do not push or drag concrete into place or use vibrators to move concrete into place.
G. Consolidate concrete according to ACI 301 by mechanical vibrating equipment supplemented by hand spading, rodding, or tamping.
    1. Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand spreading and consolidation. Consolidate with care to prevent dislocating reinforcement, dowels, and joint devices.
H. Screed pavement surfaces with a straightedge and strike off.
I. Commence initial floating using bull floats or derbies to impart an open textured and uniform surface plane before excess moisture or bleed water appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations or spreading surface treatments.
J. Curbs and Gutters: When automatic machine placement is used for curb and gutter placement, submit revised mix design and laboratory test results that meet or exceed requirements. Produce curbs and gutters to required cross section, lines, grades, finish, and jointing as specified for formed concrete. If results are not approved, remove and replace with formed concrete.
K. Slip-Form Pavers: When automatic machine placement is used for pavement, submit revised mix design and laboratory test results that meet or exceed requirements. Produce pavement to required thickness, lines, grades, finish, and jointing as required for formed pavement.
    1. Compact subbase and prepare subgrade of sufficient width to prevent displacement of paver machine during operations.
L. When adjoining pavement lanes are placed in separate pours, do not operate equipment on concrete until pavement has attained 85 percent of its 28-day compressive strength.
M. Cold-Weather Placement: Comply with ACI 306.1 and as follows. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.
    1. When air temperature has fallen to or is expected to fall below 40 deg F, uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 deg F and not more than 80 deg F at point of placement.
    2. Do not use frozen materials or materials containing ice or snow.
    3. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in mix designs.

N. Hot-Weather Placement: Comply with ACI 301 and as follows when hot-weather conditions exist:
    1. Cool ingredients before mixing to maintain concrete temperature below 90 deg F at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
    2. Cover steel reinforcement with water-soaked burlap so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
    3. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

3.07 FLOAT FINISHING

A. Float Finish: Begin the second floating operation when bleed-water sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats, or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.
    1. Construct test sections of each type of concrete paving, including at least one expansion joint and control joints, for review by CM, Owner and Architect for agreement of finish prior to starting concrete installation. Review will include texture of broom finish, joint striking, picture framing and geometric conformity.
    2. Medium-to-Fine-Textured Broom Finish: Draw a soft bristle broom across float-finished concrete surface perpendicular to line of traffic to provide a uniform, fine-line texture.
    3. Incorporate “picture framing” of concrete in finish within lump sum prices bid.

3.08 CONCRETE PROTECTION AND CURING

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.
B. Comply with ACI 306.1 for cold-weather protection.
C. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete, but before float finishing.
D. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.

E. Curing Methods: Cure concrete by moisture curing, moisture-retaining-cover curing, curing compound, or a combination of these as follows:
    1. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
    2. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.

3.09 PAVEMENT TOLERANCES

A. Comply with tolerances of ACI 117 and as follows:
    1. Elevation: 1/4 inch.
    2. Thickness: Plus 3/8 inch, minus 1/4 inch.
    3. Surface: Gap below 10-foot- long, unleveled straightedge not to exceed 1/4 inch.
    4. Lateral Alignment and Spacing of Tie Bars and Dowels: 1 inch.
    5. Vertical Alignment of Tie Bars and Dowels: 1/4 inch.
    6. Alignment of Tie-Bar End Relative to Line Perpendicular to Pavement Edge: 1/2 inch.
    7. Alignment of Dowel-Bar End Relative to Line Perpendicular to Pavement Edge: Length of dowel 1/4 inch per 12 inches.
    8. Joint Spacing: 3 inches.
    9. Contraction Joint Depth: Plus 1/4 inch, no minus.
    10. Joint Width: Plus 1/8 inch, no minus.
    11. Curbs – vertical ¼” in 10’

3.10 PAVEMENT MARKING

A. Do not apply pavement-marking paint until layout, colors, and placement have been verified with Architect.
B. Allow concrete paving to cure for a minimum of 28 days and be dry before starting pavement marking.
C. Sweep and clean surface to eliminate loose material and dust.
D. Apply paint with mechanical equipment to produce markings of dimensions indicated with uniform, straight edges. Apply at manufacturer's recommended rates to provide a minimum wet film thickness of 15 mils.
    1. Apply graphic symbols and lettering with paint-resistant, die-cut stencils, firmly secured to concrete surface. Mask an extended area beyond edges of each stencil to prevent paint application beyond stencil. Apply paint so that it cannot run beneath stencil.

3.11 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.

B. Testing Services: Testing of composite samples of fresh concrete obtained according to ASTM C 172 shall be performed according to the following requirements:

1. Testing Frequency: Obtain at least 1 composite sample for each 100 cu. yd. or fraction thereof of each concrete mix placed each day.
   a. When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.
2. Slump: ASTM C 143/C 143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mix. Perform additional tests when concrete consistency appears to change.
3. Air Content: ASTM C 231, pressure method; one test for each composite sample, but not less than one test for each day's pour of each concrete mix.
4. Concrete Temperature: ASTM C 1064; one test hourly when air temperature is 40 deg F and below and when 80 deg F and above, and one test for each composite sample.
5. Compression Test Specimens: ASTM C 31/C 31M; cast and laboratory cure one set of three standard cylinder specimens for each composite sample.
6. Compressive-Strength Tests: ASTM C 39/C 39M; test 1 specimen at 7 days and 2 specimens at 28 days.
   a. compressive-strength test shall be the average compressive strength from specimens obtained from same composite sample and tested at 28 days.

C. Strength of each concrete mix will be satisfactory if average of any 3 consecutive compressive- strength tests equal or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi.

D. Test results shall be reported in writing to Engineer, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.

E. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Architect but will not be used as sole basis for approval or rejection of concrete.

F. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Architect.

G. Remove and replace concrete pavement where test results indicate that it does not comply with specified requirements.
H. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.12 REPAIRS AND PROTECTION

A. Remove and replace concrete pavement that is broken, damaged, or defective or that does not comply with requirements in this Section.
B. Drill test cores, where directed by Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory pavement areas with Portland cement concrete bonded to pavement with epoxy adhesive.
C. Protect concrete from damage. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur.
D. Maintain concrete pavement free of stains, discoloration, dirt, and other foreign material. Sweep concrete pavement not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 32 16 00

SECTION 32 31 13 – CHAIN LINK FENCE AND GATES

PART 1 - GENERAL

1.01 SCOPE OF WORK

A. Furnish all labor, materials, equipment and incidentals required and install the chain link fence and gates as shown on the Drawings and as specified herein.

B. Installation of Temporary Security Fence

1.02 SUBMITTALS

A. Submit as specified in DIVISION 1.

B. Includes, but not limited to, the following:

1. Plan layout.
2. Details illustrating fence height, sizes of posts, rails, braces, gates, and hardware list.
3. Erection procedures.

1.03 REFERENCE STANDARDS

Applicable Standards:

A. Federal Specifications (FS):

1. FF-B-575 - Bolts, Hexagon, and Square.
2. RR-F-191J/GEN - Fencing, Wire and Post, Metal (and Gates, Chain-Link Fence Fabric, and Accessories) (General Specification).
3. RR-F-191/2 - Fencing Wire and Post, Metal (Chain-Link Fence Gates) (Detail Specification).
4. RR-F-191/3 - Fencing Wire and Post, Metal (Chain-Link Fence Posts and Braces) (Detail Specification).

B. ASTM International (ASTM): Equivalent AASHTO standards may be substituted as approved.

1. ASTM DI 784 – The Extruded product meet or exceed the standard.
2. ASTM-F668 - Standard Specification for Polyvinyl Chloride (PVC),
3. ASTM F2919, Specification for Welded Wire Mesh Fence Fabric (Metallic-Coated or Polymer Coated)

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Fences:

1. Anchor Fence Division, Anchor Post Products Inc.
2. U.S. Steel Supply Division, U.S. Steel Corp.
3. Allied Tube & Conduit Corporation.
4. Broski Fence
5. Engineer approved equal.

2.02 GENERAL

Manufacturer's standard materials where such materials conform to these Specifications.

A. Conform to FS RR-F-191J/GEN except as indicated or specified otherwise.

B. Fence Fabric Height: 7-feet.

C. Finish for framework and appurtenances: Galvanized with minimum weight for zinc per square foot as follows:

1. Pipe: Conform to FS RR-F-191/3.
2. Square Tubing: 2.0 ounces.

3. H-Sections: 2.0 ounces.
4. C-Sections: 2.0 ounces.
5. Hardware and accessories: PVC Coated following ASTM DI784 or ASTM F668 specification

2.03 POSTS AND BRACES

Minimum size and weight as follows:

A. Posts:
   1. End, Corner or Pull Posts, Line Posts, and Gate Posts: Conform to FS RR-F-191/3 (Table I).

B. Post Bracing:
   1. Diagonal galvanized truss rods 3/8-inch in diameter equipped with truss tightener.
   2. Horizontal Braces: Size SP1 conforming to FS RR-F-191/3.

C. Stretcher Bars:
   1. One piece. Length to be 1 inch less than fabric height.
   2. 3/16-inch x 3/4-inch, galvanized.

E. Post Tops:
   1. Designed as a weathertight closure cap for tubular posts.
   2. Malleable iron or pressed steel, both galvanized.
   3. Attached to steel posts or intergrate with post top.
   4. Malleable iron or pressed steel, both galvanized.

G. Bolts:
   1. Zinc coated.
   2. Conform to FS FF-B-575.

2.04 FABRIC

A. No. 9-gage, 2-inch diamond mesh chain-link fabric with PVC coated. Minimum breaking strength of the wire shall be 1,200 pounds.
B. Both selvages twisted for fabric 6'-0" and over.
C. Top and bottom selvage knuckled for fabric 5'-0" and under.
D. Fabric fastenings of 9-gage galvanized wire ties.

2.05 Sliding Cantilevered Gate:

A. Framing:
   a) Inverted channel track, roller ball-bearing truck assemblies, guides, stays, bracing, hardware, and accessories as required.
   b) Intermediate horizontal and vertical members for proper gate operation and for attachment of fabric, hardware, and accessories. Space so that frame members are not more than 8 ft. apart unless otherwise indicated.
   c) Frames assembled by welding or watertight galvanized steel rigid fittings.
   d) Diagonal cross bracing of 3/8 inch diameter adjustable truss rods to provide frame rigidity.

B. Slide Gate Motor Operator and Accessories:

1. Motor Operator:
   a) Provide a heavy duty electric-motor operator for operating the sliding cantilevered gate. Operator shall be sized to operate gate specified and indicated.
   b) Suitable for outdoor use with all parts suitably protected against corrosion and with lockable weather-resistant cover.
   c) Operator shall be designed for either left or right hand mounting and shall be designed for pad mounting.
   d) System designed to operate on a 240V, single-phase power supply.
   e) Unit shall consist of instantly reversing motor with overload protection, magnetic brake, safety clutch, and automatic limit switch. Provide with releasing switch in case of power failure.
   f) Provide with mounting channels. Operator enclosure shall be mounted on a concrete pad, size as required.
   g) Flexible hinged connections to conduit, if required.

2. Safety Devices:
   a) Provide gate edges with contact sensors to reverse the gate upon contact with an object.
   b) Provide one loop detector: Used to sense exiting vehicle traffic and provide a request to exit to the gate access control system. Provide all cabling and components for complete installation.
   c) Non-contact sensors, or contact sensors, or a combination thereof, shall be utilized to prevent persons from becoming entrapped in the gate system.
   d) Provide units with adjustable entry and exit timers.
   e) Provide for emergency vehicle entrance through gate via audible siren detector

PART 3 – EXECUTION

3.01 PREPARATION:

A. Perform final grading prior to installation of fence.
B. Follow general contour of ground and properly align fence. Install as indicated.

3.02 INSTALLATION – POSTS AND BRACES

A. Posts:
   1. Set in concrete bases as indicated. Trowel finish tops of footings and dome to direct water away from posts.
   2. Install plumb and in straight alignment.
   3. Space 10 feet center-to-center maximum.
   4. Install pull posts:
      a. Every 300 feet.
      b. At all abrupt changes in grade.
      c. At all changes in direction of 15 degrees or more.
      d. Temporarily brace until concrete in bases has set.

B. Post Bracing:
   1. Install at each end, pull and gate post, and each side of each corner post.
   2. Install after concrete in post bases has set.
   3. Install so posts are plumb when diagonal rod is under tension.

C. Stretcher Bars:
   1. Thread through or clamp to fabric 4 inches oc.
   2. Secure to posts with metal bands spaced 14 inches oc maximum.
   3. Install at each gate, pull and end post, and each side of corner post.

D. Post Tops: Install on each gate post.

3.03 INSTALLATION - FABRIC:

A. Fabric:
   1. Stretch taut with equal tension on each side of line posts.
   2. Fasten to steel posts with wire ties.
   3. Space wire ties at 14 inches oc maximum on posts.
   4. Rolls of fabric shall be joined together by weaving a single strand into the end of the roll to form a continuous piece.

3.04 REPAIRING DAMAGED COATINGS

A. Repair any damaged coatings in the shop or field by recoating with compatible and similar coating.
B. Apply per manufacturer's recommendations.

3.05 MOTOR OPERATED GATES:

A. Install all hardware, tracks, framing, supports, electrical devices, wiring, loop controller, and appurtenances required for a complete system and satisfactory operation.
B. Install to conform to manufacturer’s instructions and as indicated.
C. Test and adjust system for smooth proper operation.

END OF SECTION 32 31 13

SECTION 32 92 00.10 NATIVE GRASSES

PART 1 - GENERAL

1.01 SUMMARY

A. This Section includes the following areas of Work:
   1. Seeding for Native Grasses.
   2. Topsoil.
   3. Soil Amendments.
   4. Fertilizer.
   5. Straw Mat.
   6. Erosion Control
   7. Miscellaneous Material
   8. Maintenance.

B. Related Work Specified Elsewhere:
   1. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.
   2. Section 31 20 50 – Site Preparation and Earthwork.

1.02 REFERENCES

A. Applicable Standards:
   1. American Society for Testing and Materials (ASTM) - Equivalent AASHTO standards may be substituted as approved.

1.03 SUBMITTALS

A. General: Upon completion of the installation, deliver to Landscape Architect the following in accordance with the Conditions of the Contract and Division 1 Specification Sections.
   1. Plant and Material Certificates:
      a. Seed shall be accompanied by certificate from vendors certifying they meet requirements of these Specifications, stating botanical name, percentage by weight, percentage of purity, germination, and weed seed for each grass seed species.
      b. Certificates of inspection as required by governmental authorities.
      c. Certification of grass seed from seed vendor for each grass-seed mixture stating the botanical and common name and percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.
      d. Vendor must have available seed label for certification of grass seed mixtures. Source must be from an environmentally controlled facility. All seed mixtures must be Blue Tag certified, no exception.
      e. Planting schedule indicating anticipated dates and locations for each type of planting.
      f. Maintenance instructions recommending procedures to be established by Contractor for maintenance of landscaping during an entire year. Submit 3 copies before expiration of required maintenance programs.
      g. Qualification data for firms and persons specified in “Quality Assurance” article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and Owner’s, and other information specified.
      h. Soil amendments
      i. Mulch
      j. Erosion Control

k. Inoculants

1.04 QUALITY ASSURANCE

A. Qualifications:
1. A qualified Contractor shall employ or provide a qualified installation manager who meets any of the required qualifications.
a. Bachelor of Science Degree in Horticulture, Botany, Soil Physics, Agronomy, General Agriculture, Agricultural or Biological Engineering, or a related field.
2. The above-described individual(s) shall be identified by the contractor and shall be on the project during the following installations.
a. Native seed Installation/Maintenance.

B. Installer Qualifications: Engage a single firm specializing in landscape work with experience completing landscaping work similar in material, design, and extent to that indicated for this Project and with a record of successful landscape establishments.
1. Installers Field Supervision: Require installers to maintain an experienced full-time Supervisor on the project site during times that landscaping is in progress.

C. The Contractor shall provided maintenance recommendations to be implemented by the installation and maintenance contractor, in the manner approved by the Landscape Architect as follows:
1. Monthly: For the first three (3) months following completion of each native seeding area.
2. Seasonally: Spring and Fall for a total of 6 reports.

1.05 LANDSCAPING

A. Packaged Materials: Deliver packaged materials in containers showing weight, analysis, and name of manufacturer. Protect materials from deterioration during delivery and while stored at site.

1.06 DELIVERY, STORAGE AND HANDLING

A. Packaged Materials: Deliver packaged materials in containers showing weight, analysis, and name of manufacturer. Protect materials from deterioration during delivery and while stored at site.

B. Native Seed: Deliver separate containers with sealed labels.

1.07 PROJECT CONDITIONS

A. Utilities: Determine location of above grade and underground utilities and perform work in a manner which will avoid damage. Hand excavate, as required. Maintain grade stakes until removal is mutually agreed upon by parties concerned.

B. Excavation: When conditions are detrimental to plant growth are encountered, such as rubble fill, adverse drainage conditions, or obstructions, notify Landscape Architect before planting.

1.08 SEQUENCING AND SCHEDULING

A. General Warranty: The special warranty specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.

B. For Native Grasses, the Contractor shall provide a warranty period of twelve (12) months.

PART 2 - PRODUCTS

2.01 NATIVE GRASSES

A. Fresh, clean, dry, pure-live seed complying with Missouri Department of Agriculture laws for purity, germination, and noxious weed tolerances.
   1. Seed Components: Provide seed of grass and forb species and varieties, proportions by weight, and minimum percentages of purity, germination, and maximum percentage of weed seed as indicated on Schedules at the end of this Section. Seed lots, unblended, shall be provided to horticulturist in original unopened containers for agro-histological determination and re-testing. The Master label shall be produced by the horticulturist and shall be sealed according to the appropriate laws and regulations.
   2. All seed must be tested by a registered seed technologist per AOSA methods and meet all requirements established by the Missouri Department of Agriculture. The contractor will provide documentation with the seed shipment for the following information.
      a. State of Origin
      b. County of Origin
      c. Year of Harvest
      d. Genus species Identification
      e. Seed Lot #
      f. Packaged Quantity
      g. Identification of Seed Supplier
      h. Supplier Certification Number
      i. State of Supplier Registration
      j. Percent PLS Per Seed Lot
      k. Percent Germination
      l. Percent Hard Seed
      m. Percent Foreign Matter
      n. Percent Weed Seed
      o. Identification of Noxious Weed Seed
      p. Date of Seed Testing
      q. Identification of Seed Testing Company

B. Landscape Architect has final approval, no exceptions.

C. Seed Source: Shall be submitted to Landscape Architect for approval. Seed orgin shall be restricted to within 100 miles of Kansas City, Missouri.

D. Provide fresh, clean, new-crop seed complying with tolerance for purity and germination established by Official Seed Analyst of North America. Provide seed mixture composed of grass and forb species, proportions and minimum percentages purity, germination, and maximum of seed as specified:
   a. Seed Mix: Seeding of this mix should only occur in spring (before June 15th).

Scientific Name	Common Name	Lbs/Acre	% of Mix
Bouteloua curtipendula	Side-oats Grama	60	95%
Bouteloua dactyloides ‘Bowie’	Bowie Buffalo Grass	5	5%
	Total lbs. seed/Acre	65	

E. Cover Crop Seeding
   a. Cover crop seeding shall be installed when seasonal conditions do not allow for seeding of the native grass mix specified above.
   b. Provide fresh, clean, new-crop seed complying with tolerance for purity and germination established by Official Seed Analysts of North America. Provide seed mixture composed of grass species, proportions and minimum percentages

Scientific Name	Common Name	Min. % PLS	Min. % Germination	% of Mix
Avena sativa	Annual Oats	98%	90%	100%
	Total lbs. PLS/Acre			10

c. Cover Crop Application Rate: 10 lbs. PLS per Acre

2.02 TOPSOIL

A. Topsoil Source: Reuse surface soil stockpiled on the site. Verify suitability of surface soil to produce topsoil meeting requirements and amend to achieve required pH and organic content as necessary and recommended through soil tests. Clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth. Soil shall not contain more than 20 stones or other foreign material less than 1 inch (25 mm) in diameter in any one square yard area.

2.03 SOIL AMENDMENTS

A. Peat Humus: Shredded horticultural grade sphagnum peat moss, 90% organic moss peat, with ash content of 10% or less, brown in color.
B. Manure: Well-rotted, unleached stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, and material harmful to plant growth.
C. Water: Potable.

2.04 FERTILIZER

A. Do NOT use fertilizers in Native Grass seeding areas.

2.05 EROSION CONTROL

A. Erosion control blanket shall be produced from 100% coconut coir fiber, biodegradable double jute netting, with 50% open area, biodegradable jute yarn thread, rated for a 2 year longevity rating.
B. Staple over edges and drape oversides for overlap finish, minimum 6” overlap required.

2.06 MISCELLANEOUS MATERIALS

A. Mycorrhizal Inoculant: The Contractor shall utilize an organic mycorrhizal inoculant for erosion repair. Inoculants shall be used per manufacturer’s specifications.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas to receive landscaping for compliance with requirements and for conditions affecting performance of work of this Section. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Lay out seeding areas. Stake locations and secure Landscape Architect’s acceptance before the start of planting work. Make minor adjustments as may be required.

3.03 SEEDING COVER CROP, NATIVE GRASSES

A. Sow seeds using seed drill (Truax-type) that accurately meters the seed types and mixes all seeds uniformly during seeding. It should have, at the minimum, two seed boxes to separate fine seeds from large/fluffy seeds. This seed drill should also be equipped with disc furrow openers and a no-till trash plow assembly, which will compact the soil directly over the drill rows. The maximum row spacing for drill seeding should be 8 inches. Fine seeds shall be dropped onto the ground from the fine seed box, while large/fluffy seed should be placed to obtain final planting depth of 1/4-1/2". The path of the drill seeding shall be done at a right angle to that of the drainage patterns.
   1. Do not use wet seed or seed that is moldy or otherwise damaged in transit or storage.

3.04 SOW NATIVE SEED ACCORDING TO THE FOLLOWING SCHEDULES

A. Hand Broadcast or Drill seed Cover crop of Annual Oats, in quantities specified in Part 2, over native seed areas immediately after fine grading is completed.
B. Drill Native Seed, in quantities specified in Part 2, between April 1st through June 18th or October 1st through November 30th after construction operations are complete.
C. Protect all native grass areas on slopes 4:1 and greater using straw mat erosion control blanket installed and stapled according to manufacturer's recommendations.

3.05 NATIVE GRASS AND WILDFLOWER MAINTENANCE

A. Begin maintenance of native grass areas immediately after each area is planted and continue until established and accepted, but for not less than the following periods:
   1. Native grass: Two years after date of Substantial Completion.
   2. The Installer shall be responsible for the proper care until verification that all plant materials (time meander survey) are present in the density and health to ensure self-maintenance.
B. Maintain and establish native grasses by mowing, weeding, trimming, replanting, and other operations as stated below. Re-grade erosion rills, replant bare or eroded areas, and re-mulch to produce a uniform prairie. Landscape installer shall perform maintenance as determined by the horticulturist.
C. Year One:
   1. Maintenance (June-September)
      a. Mow to 8" when plants reach 12" during first complete growing season. After first complete growing season, mow to 8" and remove thatch in late February/March to remove mature top growth.
      b. Weed Control - mowing should keep annual weeds down. Spot spray weeds using Round-Up before first mowing.
      c. Overseed all native prairie and wildflower areas with the same mix and seeding rate as first seeding, 1 year after first seeding.
      d. If first seeding occurs late fall or early winter, overseed in spring.
   2. Monitoring:
      a. Monitor for invasive weeds such as: velvet leaf, brome grass, Johnson grass, crown vetch, clover, prickly lettuce, etc. Spot spray as necessary.
   3. Evaluation and Remediation:
      a. Cover crop should be growing within 2 weeks of planting.
      b. Seedlings spaced 1-6" apart in drill rows.
      c. Native grass seedlings may only be 4-6" tall.
      d. If there is a flush of growth from invasive weeds, mow more frequently.
      e. Fill in and reseed rills caused by erosion (May-July).
      f. As determined by the horticulturist, add new mulch in areas where mulch has been disturbed by wind or maintenance operations sufficiently to nullify its purpose. Anchor as required to prevent displacement.

4. Watering: Provide and maintain temporary piping, hoses, and lawn-watering equipment to convey water from sources and to keep lawns uniformly moist to a depth of 4 inches.
    a. Lay out temporary lawn-watering system and arrange watering schedule to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly seeded areas.
    b. Daily for the first week, 1-1 ½ inch minimum depth.
    c. Every 3-4 days for the second week at the minimum rate of 1 inch per week.
    d. One day a week for the next 60 days at the minimum rate of 1 inch per week.

3.06 SATISFACTORY NATIVE GRASS WILDFLOWER STANDS

A. An acceptable native grass stand will contain no less than 5 healthy mature or developing plants per square foot with a population distribution per 10,000 square feet representative of ratios in the original blend. The result of maintenance shall be that weeds are being controlled through competition with the desired plants, and that mowed bio-mass is not accumulating in such a manner to be detrimental to existing plant materials as determined by the Landscape Architect.

B. An acceptable native grass stand shall control erosion through root mass development. The occurrence of rills and gullies shall be unacceptable.

3.07 PROTECTION

A. Erect barricades and warning signs as required to protect newly planted areas from traffic. Maintain barricades throughout maintenance period until lawn is established.

B. Sodded lawns will be acceptable provided requirements, including maintenance, have been complied with and healthy, well-rooted, even-colored, viable lawn is established free of weeds, open joints, bare areas, and surface irregularities.

3.08 CLEANUP

A. Promptly remove soil and debris created by lawn Work from paved areas. Clean wheels of vehicles prior to leaving Site to avoid tracking soil onto surfacing of roads, walks, or other paved areas.

B. Disposal or Surplus and Waste Material
    1. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of it off the Owner's property.

3.09 MEASUREMENT AND PAYMENT

A. Time of Completion: Completion time for seeding shall not apply to provisions for liquidated damages with respect to Contract completion time. Payment for seeding and sodding will be withheld until such Work is accepted.

END OF SECTION 32 92 00.10

SECTION 32 93 00 - TREES AND SHRUBS

PART 1 - GENERAL

1.01 SUMMARY

A. This SECTION includes the following:
   1. Furnishing trees and shrubs.
   2. Preparation of planting pits and beds, including excavation, backfilling, and disposal of surplus and unsuitable excavated material.
   3. Planting of trees and shrubs, including fertilizing, mulching, trimming, guying, and wrapping.
   4. Maintenance of trees and shrubs.

1.02 REFERENCE

A. Applicable Standards:
   1. American National Standards Institute (ANSI):
      a. Z60.1 - Nursery Stock.

1.03 SUBMITTALS

A. Submit as specified in DIVISION 01.

B. General: Upon completion of the installation, deliver to Landscape Architect the following in accordance with the Conditions of the Contract and DIVISION 0I Specification Sections. C. Include, but not limited to, the following:
   1. Product Certification: Certificate of inspection as may be required by governing authorities. For standard products, submit manufacturer's certified analysis. For other materials, submit analysis by a recognized laboratory made in accordance with methods established by Association of Official Agricultural Chemists, wherever applicable.
   2. Manufacturers Literature: Submit three (3) copies of fertilizer manufacturer’s literature along with schedule of maintenance program spanning the life of the guarantee and three (3) copies of a recommended post guarantee maintenance program.
   3. Label data substantiating that trees and shrubs comply with specified requirements.
   4. Materials List: Within 15 days after award of contract, and before any materials are delivered to the job site, submit to Landscape Architect a complete list of all plants including the sizes ordered and the type of equipment to be used on this project.
   5. As-Built Drawings: During course of installation, carefully record in red line on a print of the planting drawings all changes made to the planting system layout during installations; approved by the Landscape architect. Final payment for planting will not be authorized until an accurate and complete as-built is submitted.
   6. Planting Schedule: Proposed planting schedule, indicating dates for each type of landscape work during normal seasons for such work in area of site. Correlate with specified maintenance periods to provide maintenance from date of Substantial Completion. Once accepted, revise dates only as approved in writing, after documentation of reasons for delays.
   7. Maintenance Instructions: Typewritten instructions recommending procedures to be established by Owner for maintenance of landscape work for one full year. Submit prior to expiration of required maintenance period(s).

D. Product Data: Submit product data, supplier sources and small sample of the following:
   1. Shredded Hardwood Mulch
   2. Fertilizer Planting Tablets

3. Steel Edging
4. Weed Barrier
5. Herbicide and Pre-emergent

1.04 QUALITY ASSURANCE

A. Installers Qualifications: Engage a single firm specializing in landscape work with experience completing landscaping work similar in material, design, and extent to that indicated for this project and with a record of successful landscape establishment.
   1. Installers Field Supervision: Require installers to maintain an experienced full-time Supervisor on the project site during times that landscaping is in progress.

B. Source Quality Control.
   1. General: ship landscape materials with certificates of inspection required by governing authorities. Comply with regulations applicable to landscape materials.
   2. Do not make substitutions. If specified landscape material is not obtainable, submit proof of non-availability to Landscape Architect, together with proposal for use of equivalent material.
   3. Topsoil: Topsoil from the project site shall be used for all planting operations. All topsoil used in planting operations shall meet standards as defined in this specification.
   4. Trees and shrubs: Provide trees and shrubs of quantity, size, genus, species, and variety shown and scheduled for landscape work and complying with recommendations and requirements of (ANSI Z60.1-1986) "American Standard for Nursery Stock" for number one grade nursery stock as adopted by the American Association of Nurserymen. Provide healthy, vigorous stock, grown in recognized nursery in accordance with good horticultural practice and free of disease, insects, eggs, larvae, and defects such as knots, sun-scald, injuries, abrasions, and disfigurement.
      a. Measurements: Measure trees and shrubs according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6 inches (150mm) above ground for trees up to 4-inch (100mm) caliper size, and 12 inches (300mm) above ground for larger sizes. Measure main body of tree or shrub for height and spread; do no measure branches or roots tip-to-tip.
   5. Label at least one tree and one shrub of each variety with a securely attached waterproof tag bearing legible designation of botanical and common name.

C. Inspection: The Contractor shall notify the Landscape Architect of the location of plant materials to be used and allow the Landscape Architect the opportunity to inspect them either at the place of growth or at the site before planting, for compliance with requirements for genus, species, variety, size, and quality. The Owner retains the right to further inspect trees and shrubs for size and condition of root balls and root systems, insects, injuries and latent defects, and to reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from the project site.

D. Preinstallation Conference: Conduct conference at Project Site to comply with requirements of DIVISION 01 SECTION - “Project Meetings”.

1.05 OBSERVATIONS

A. In addition to normal progress observations, schedule, and conduct the following formal observations to verify compliance with the specifications, giving the Landscape Architect at least 24 hours prior notice of readiness for observation.

B. Trees and Shrubs: The Landscape Architect shall observe the trees and shrubs at site before planting for compliance with requirements for genus, species, variety, size, and quality.
   1. If the Contractor requests, the Landscape Architect may observe plant materials at place of growth or storage.
   2. The Contractor shall notify the Landscape Architect 72 hours in advance of when plant material is to be delivered and shall furnish an itemized listing of the actual quantities and size of plant materials to be observed at the point of delivery.
   3. Landscape Architect retains the right to further observe trees and shrubs for size and conditions of balls and root systems, insects, injuries, and latent defects, and to reject unsatisfactory or defective material at any time during progress of work. Remove rejected plants immediately from project site and replace at the Contractor's expense with approved materials.
   4. Landscape Architect further retains the right for:
      a. Observation of labels and the condition of all items delivered to the site.
      b. Observation of any repairs or replacements necessary.
      c. Observe the staking for all trees and shrubs prior to planting.
      d. Observation of bed preparation prior to planting of trees and shrubs.
      e. Observation of plant material at end of plant warranty period.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Provide freshly dug trees and shrubs. Do not prune prior to delivery. Provide adequate protection of root systems and balls from drying winds and sun. Do not bend or bind-tie trees or shrubs in such a manner as to damage bark, break branches, or destroy natural shape. Provide protective covering during delivery. Do not drop balled and burlapped stock during delivery.

B. Deliver trees and shrubs after preparations for planting have been completed, and plant immediately. If planting is delayed more than 6 hours after delivery, set trees and shrubs in shade, protect from weather and mechanical damage, and keep roots moist as follows:
   1. Heel-in bare root stock. Soak roots in water for 2 hours if dried out.
   2. Set balled stock on ground and cover ball with soil, peat moss, sawdust or other acceptable material.
   3. Do not remove container-grown stock from containers until planting time.
   4. Periodically water root systems of trees and shrubs stored on site using a fine mist spray. Water often to maintain root systems in a moist condition.

C. Replacements: In the event of damage or rejection, immediately make all repairs and replacements necessary to the approval of the Landscape Architect and at no additional cost to the Owner.

1.07 JOB CONDITIONS

A. Utilities: determine location of underground utilities and perform work in a manner which will avoid possible damage, hand excavate if conditions require. Maintain grade stakes set until removal is mutually agreed upon by parties concerned.

B. Excavation: When conditions detrimental to plant growth are encountered, such as pebble fill, adverse drainage conditions, or obstructions, notify Landscape Architect before planting.

C. Sequencing and Scheduling:
   1. Planting Time: Proceed with, and complete landscape work as rapidly as portions of site become available, working within seasonal limitations for each kind of landscape work required.

2. All planting shall be performed during favorable weather conditions. The planting operations shall not be performed during times of extreme drought, when ground is frozen, or during times of other unfavorable climatic conditions unless otherwise approved by the Landscape Architect. The Contractor assumes full and complete responsibility for all such plantings and operations.
3. Plant frost-tender trees and shrubs only after danger of frost is past or sufficiently before frost season to allow for establishment before first frost. Do not plant in frozen ground.
4. Dig, ball and burlap deciduous plants only when dormant (before March 15 and after October 15). Such plants may be planted at any time during the same year, subject to the other requirements of the specification.
5. Evergreen plants may be planted in the spring until new growth appears or after new growth has hardened off and any time between September 15 and November 30. If the plants have not been dug, they should not be planted until new growth has hardened off.
6. Recommended dates for tree and shrub planting shall be March 15 - May 31 and September 15 – October 31st or as approved by the Landscape Architect.

D. Plant trees and shrubs after final grades are established and prior to planting of lawns, unless otherwise acceptable to the Landscape Architect. If planting of trees and shrubs occur after lawn Work, protect lawn areas and promptly repair damage to lawns resulting from planting operations.
E. Correlate planting with specified maintenance periods to provide maintenance from date of Substantial Completion.
F. Coordination: All planting work shall be coordinated with all other work included in this contract.

1.08 SPECIAL PROJECT WARRANTY

A. General Warranty: Warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
B. Special Warranty: Warrant the following living planting materials for a period of one (1) year after date of Substantial Completion, against defects including death and unsatisfactory growth, except for defects resulting from lack of adequate maintenance, neglect, or abuse by the Owner, abnormal weather conditions unusual for warranty period, or incidents that are beyond the Contractor’s control.
   1. Trees
   2. Shrubs
C. Immediately prior to plant warranty observation, the Contractor will be responsible for the removal of all staking material on site.
D. Replacement Trees and Shrubs: The Contractor shall replace once, without cost to Owner, and as soon as weather conditions permit, and within a specified planting period, all dead plants and all plants not in a vigorous, thriving condition as determined by the Landscape Architect during and at the end of the warranty period. The plants shall be free of dead or dying branches and branch tips, and shall bear foliage of a normal density, size, and color.
E. Replacements shall closely match adjacent specimens of the same species. Replacements shall be subject to all requirements stated in the Specifications.
F. The Contractor shall make all necessary repairs to other site and project features due to plant replacements. Such repairs shall be done at no cost to the Owner.

G. Materials and Operations: All replacements shall be plants of the same kind and size specified in the plant schedule. They shall be furnished and planted as specified. The cost shall be borne by the Contractor. After Substantial Completion replacements resulting from the removal, loss, or damage due to occupancy of the project site, vandalism, or acts or neglect on the part of others, or physical damage by animals, may be approved and paid for by the Owner.

PART 2 - PRODUCTS

2.01 GENERAL

A. Provide nursery-grown trees and shrubs, grown in a recognized nursery in accordance with good horticultural practice, with healthy root systems developed by transplanting or root pruning. Provide only healthy, vigorous stock grown under climatic conditions similar to conditions in the locality of the Project and free of disease, insects, eggs, larva, and defects such as knots, sun scald, injuries, abrasions, or disfigurement.

B. Provide trees and shrubs of the sizes indicated in planting list and in accordance with dimensional requirements of ANSI Z60.1 for kind and size of trees and shrubs required. Trees and shrubs of larger size than indicated may be used if acceptable to Landscape Architect.

C. Label each tree and shrub with a securely attached waterproof tag bearing legible designation of botanical and common name.

D. Nomenclature: Scientific and common names used for plants are generally in conformity with "Standardized Plant Names." The names of varieties are generally in conformity with the names accepted in nursery trade.

E. Plant material size and measurements shall conform to the “American Standard for Nursery Stock”, ANSI Z60.1-1986.

F. Digging, wrapping, and shipping:

1. Plants shall be dug up and prepared for shipment in a manner that will not cause damage to the branches, shape and future development of the plants after replanting. All plant material being transferred more than two miles shall be covered.

2.02 TREES

A. Trees shall not be pruned before delivery. Trees, which have a damaged or crooked leader or multiple leaders, unless otherwise specified, will be rejected. Trees with abrasion of bark, sunscalds, disfiguring knots, or fresh cuts of limbs over 1 inch in diameter which have not completely calloused will be rejected.

1. Plants shall be measured when branches are in a normal position. If a range of size is given, no plants shall be less than the minimum size and not less than 50% of the plants shall be as large as the upper half of the range specified. The measurements specified are the minimum size acceptable and are the measurements after pruning where pruning is required. Plants that meet the measurements specified, but do not possess a normal balance between height and spread will be rejected.
2. Plants shall be true to species and variety and shall conform to measurements specified in the Plant Schedule except that plants larger than specified may be used if approved by the Landscape Architect. Use of such plants shall not increase the contract price. If larger plants are approved, the ball of earth shall be increased in proportion to the size of the plant according to ANSI Z60.1-1986.

B. Balled and Burlapped Plants:

1. All plants designated "B&B" in the Plant Schedule shall be adequately balled with firm natural balls of earth of a diameter and depth no less than that specified in ANSI 60.11986. Balls shall be firmly wrapped with burlap. All plants which are 2" in caliper or over shall be drum laced. No balled plants shall be planted if the ball is cracked or broken either before or during the process of planting.
2. Container grown plants will be acceptable in lieu of balled and burlapped deciduous plants subject to specified limitations of ANSI Z60.1 for container stock.

C. Protection against drying:
1. Root balls shall be adequately protected at all times from sun and from drying winds. All balled and burlapped plants which cannot be planted immediately upon delivery shall be set on the ground and well protected with soil or other acceptable material. Plants shall not remain unplanted for longer than 3 days after delivery.

D. Where shade trees are required, provide single stem trees with straight trunk and intact leader, free of branches to a point about 50% of their height for the size and kind of trees required.

E. Where small trees of upright or spreading type are required, provide trees with single stem, branched or pruned naturally according to species and type:
1. Where indicated as "multi-stem," provide trees with three canes starting from the ground.

F. Except as otherwise specified or indicated, provide bare root trees. Where indicated as "B&B," provide balled and burlapped trees:
1. Container-grown trees will be acceptable in lieu of balled and burlapped deciduous trees, subject to the specified limitations for container stock.

2.03 DECIDUOUS SHRUBS

A. Provide shrubs of height and size indicated or specified.

B. Provide with not less than the minimum number of canes required by ANSI Z60.1 for the type and height of shrub required.

C. Except as otherwise specified or indicated, provide bare root shrubs. Where specified or indicated as "B&B," provide balled and burlapped shrubs.
1. Container-grown shrubs will be acceptable in lieu of balled and burlapped shrubs subject to specified limitations for container- grown stock.

2.04 CONIFEROUS AND BROADLEAF EVERGREENS

A. Provide evergreens of sizes indicated or specified. Dimensions indicate minimum spread for spreading and semi-spreading evergreens and height for all other types, such as globe, dwarf, cone, pyramidal, broad up-right, and columnar. Provide evergreens with well-balanced form complying with requirements for other size relationships to the primary dimension.

B. Normal quality evergreens unless indicated as "specimen." Where indicated as "specimen," provide exceptionally heavy, well-shaped evergreens of Heavy Grade XXX. C. Provide balled and burlapped evergreens.
1. Container-grown evergreens will be acceptable subject to the specified limitations for container-grown stock.

2.05 TOPSOIL

A. Soil Mix: ASTM D 5268, pH range of 5.5 to 7, 4 percent organic material minimum, free of stones 1/2 inch or larger in any dimension, subsoil, clay lumps, roots, brush, weeds, weed seed, and other extraneous or toxic materials harmful to plant growth. Mix shall contain maximum soluble salts of 500 PPM.

B. Soil Source: Reuse surface soil stockpiled on the site. Verify suitability of surface soil to produce topsoil meeting requirements and amend when necessary. Supplement with imported topsoil when quantities are insufficient. Clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth.

2.06 SOIL AMENDMENTS

A. Spaghnum Peat Moss: Peat moss shall be Canadian Sphagnum Peat Moss, which is a light brown, fluffy material. Do not use hypnum, Michigan, or reed sedge peats.

B. Mulch: Aged, shredded hardwood mulch that is free from deleterious materials shall be used for top dressing of trees or shrubs. Size of particles may vary from minimum of ¼ inch to maximum of 2 inches.

C. Commercial Fertilizer: Fertilizer shall be of the grade, type and form specified below and shall comply with the rules of the local governing authority and the following requirements:
   1. The grade of fertilizer will be identified according to the percentage of nitrogen (N), percent available phosphoric acid (P2O5) and percent water soluble potassium (K2O), in that order and approval will be based on that identification.
   2. Fertilizer shall be of a type that can be uniformly distributed either by hand or application equipment.
   3. Fertilizer shall be furnished in dry form.
   4. Fertilizer may be either homogenized or natural organic with at least 25 percent of the total nitrogen in a slow-release form.
   5. Deliver fertilizer in original, unopened and undamaged containers showing weight, analysis and name of manufacturer. Store in manner to prevent wetting and deterioration.

D. Fertilizer applications shall be provided as follows:
   1. For trees and shrubs: Fertilizer shall be 20-10-5 Planting Tablets, and shall be incorporated according to the manufacturer's directions and at the following rates:
      a. Trees: Use 1 21-gram tablet for each 1/2-inch of trunk diameter for each foot of height or spread. Insert 21-gram tablets around the dripline
      b. Shrubs: Use 1 to 2 tablets for each 1 foot of height or spread of shrubs and large perennial grasses.

2.07 MISCELLANEOUS MATERIALS

A. Steel Edging: Commercial steel edging fabricated in sections with loops pressed from or welded to face to receive stakes. Edging tobe 1/8” thick x 4” wide x 10’ lengths, hot rolled low carbon steel (ASTM-A-36, ASTM-A-283, ASTM-A-569), treated with rust preventative and factory finished, (submit sample). Provide minimum 12” integral anchor stakes.

B. Shredded hardwood mulch: Double ground aged brown hardwood mulch.

C. Tree Wrap: Material used in wrapping tree trunks shall be waterproof crepe paper or burlap strips as made and sold for this purpose and shall not be less than 4" or more than 8" wide having qualities to resist insect infestation. Twine for tying shall be a lightly tarred medium or coarse sisal yarn.

D. Pre-Emergent Herbicide. Provide a granular pre-emergent herbicide formulated to prevent germination of weed seeds, suitable for application in landscaped areas as per manufacturer’s recommendations

E. Tree Stakes and Guys:
   1. All trees shall be staked with 3 metal “T” posts. Stakes shall be approximately 2" wide and 6-6.5 feet long. Stakes are to be driven a minimum of 2 feet into undisturbed stable earth.

2. Tree Ties: An acceptable tree tie is one that is easily adjustable, strong in all weather, and is easily attached and removed. Hose and wire are not acceptable for staked trees.

F. Ornamental Aggregate: Provide washed river rock, nominal size 1”-3”, submit sample for final approval by Owner.

G. Water: Upon request of the Contractor, the Owner may approve the use of water from existing hydrants for this work. The Owner may pay for the cost of the water. The Contractor shall provide all needed hose, sprinkler heads and other appurtenances. If the Contractor provides his own water, it shall not contain material injurious to plant growth.

H. Anti-Desiccant: Emulsion type, film-forming agent designed to permit transpiration, but retard excessive loss of moisture from plants. Deliver in manufacturer's fully identified containers and mix in accordance with manufacturer's instructions.

I. Biostimulant: The Contractor shall utilize an organic, biological fungi for soil prep. The material shall be granular and applied according to the manufacturer’s recommendation.

J. Filter Fabric: Geotextiles shall be manufactured from randomly oriented synthetic long chain or continuous polymeric filaments or yarns (such as polypropylene, polyethylene, polyester, polyamide, or polyvinylidene-chloride) bonded together by the needle punched process. In addition, one side may be slightly heat-bonded. The geotextile shall be formed into a stable network of filaments or yarns that retain their relative position to each other; are inert to commonly encountered chemicals; and are resistant to ultraviolet light, heat, hydrocarbons, mildew, rodents and insects. The geotextile shall be free of any chemical treatment or coating the might significantly reduce its permeability and shall have no flaws or defects that significantly alter its physical properties.

K. All other materials, not specifically described but required for a complete and proper installation or construction, shall be as selected by the Contractor subject to the approval of the Landscape Architect.

PART 3 - EXECUTION

3.01 SURFACE CONDITIONS

A. Inspection:
1. Prior to all landscape installation, carefully inspect the installed work of all other trades and verify that all such work is complete to the point where this installation may properly commence.
2. Weeds that have emerged or persisted shall be removed or eradicated.
3. Verify that planting may be completed in accordance with the original design and the referenced standards.

B. Discrepancies:
1. In the event of discrepancy, immediately notify the Landscape Architect.
2. Do not proceed with installation in areas of discrepancy until all such discrepancies have been fully resolved.

3.02 PREPARATION FOR PLANTING OF TREES AND SRUBS

A. Planting Soil Preparation:
1. Before mixing, clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth.

2. Mix soil amendments and fertilizers with topsoil at rates indicated. Delay mixing fertilizer if planting does not follow placing of planting soil within two (2) days.
3. Schedule of Plantings Soil Mixture Requirements
   a. For planting beds, provide not less than the following quantities of specified materials:
      (1) Loose peat humus by volume: 1part
      (2) Well-rotted composted manure by volume: 1 part
      (3) Topsoil (as defined in this specification): 2 parts
      (4) Fertilizer: Incorporate 3 lbs/100sf
   b. For backfill for trees provide specified materials in not less than the following quantities:
      (1) Loose peat humus by volume: 1 part
      (2) Well-rotted cow manure by volume: 1 part
      (3) Topsoil (as defined in this specification): 3 parts
      (4) Place fertilizer tablet in bottom of tree pit.

B. Unless directed by the Landscape Architect, the indication of a plant on the Planting Plan is to be interpreted as including the digging of a hole, furnishing of a plant of the specified size, the work of planting, wrapping and other activities where called for.

C. Planting Coordination:
1. Consult the Plant Schedule for type and size of Trees and Shrubs.
2. The Contractor shall be responsible for selection and tagging at nurseries stocking the specified materials.
3. Contractor shall inform the Landscape Architect three (3) days in advance of when planting will commence, and of anticipated delivery date of material and will furnish an itemized listing of actual quantities of plant materials to be delivered. Failure to notify the Landscape Architect in advance, in order to arrange proper scheduling, may result in loss of time or removal of any plant or plants not installed as specified or directed.

D. Plant Location Staking:
1. The Contractor shall stake on the ground the beginning and ending points of all straight rows of plant materials. Rows will be parallel to adjacent walks, walls, or curbs.
2. The Contractor will stake locations of each plant in all random arrangements of plant materials (with the exception of groundcovers, and annual and perennial flowers) or may set the plants in their intended location, according to the arrangements shown on the plans.
3. The Landscape Architect will observe all plant locations. The Contractor shall not begin excavating plant pits until plant locations have been approved.
4. In case underground obstruction or utilities are encountered, locations shall be changed under the direction of the Landscape Architect without extra charge to the Owner.

3.03 EXCAVATION FOR TREES AND SHRUBS

A. Holes for trees shall be a minimum of 1.5 times greater in diameter than the spread of the root ball and at least 3 inches deeper than the root ball. Holes for shrubs and groundcover shall be a minimum of 1.5 times greater than the spread of the root ball or plant container and at least 3 inches deeper than the bottom of the roots. Thoroughly spade slice the walls and the floor of all planting pits.

B. Testing Plant Materials Holes: If stone, underground construction work, tree roots, poor drainage or obstructions are encountered in the excavation of plat pits, alternate locations may

be selected by the Landscape Architect. Where locations cannot be changed as determined by the Landscape Architect, submit cost required to remove the obstructions to a depth of not less than 6 inches below the required pit depth.

C. Excavate pits, beds, and trenches with vertical sides and with bottom of excavation slightly raised at center to provide proper drainage. Loosen hard subsoil in bottom of excavation:
   1. For bare-root trees and shrubs, make excavations as detailed.
   2. For balled and burlapped trees and shrubs, make excavations as detailed.
   3. For container-grown stock, excavate as specified for balled and burlapped stock, adjusted to size of container width and depth.
   4. Where drain tile is indicated or required under planted areas, excavate to top of porous backfill over tile.
   5. Obstructions: If rock, underground construction, or other obstructions are encountered in excavation for planting of trees or shrubs, notify Landscape Architect. New locations may be selected by Landscape Architect or Change Order may be issued to direct removal of obstructions to depth of not less than 6 inches below required planting depth.
   6. Drainage: If subsoil conditions indicate retention of water in planting areas, as shown by seepage or other evidence indicating presence of underground water, notify Landscape Architect before backfilling. A Change Order may be issued to direct installation of drain tile or other measures beyond drainage requirements indicated.

3.04 PREPARATION OF PLANTING SOIL

A. Before mixing, clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful or toxic to plant growth.
B. Mix soil amendments and fertilizers with topsoil. Delay mixing of fertilizer if planting will not follow placing of planting soil within a few days.
C. For pit- or trench-type backfill, mix planting soil prior to backfilling and stockpile at site.
D. Setting and Backfilling:
   1. Set balled and burlapped stock on layer of compacted planting soil mixture, plumb and in center of pit or trench with top of ball at same elevation as adjacent finished landscape grades. Remove burlap from sides and tops of balls, but do not remove from under balls. When set, place additional backfill around base and sides of ball, and work each layer to settle backfill to eliminate voids and air pockets. When excavation is approximately two thirds full, water thoroughly before placing remainder of backfill. Repeat watering until no more is absorbed. Water again after placing final layer of backfill.
   2. Set bare-root stock on cushion of planting soil mixture. Spread roots and carefully work backfill around roots by hand and puddle with water until backfill layers are completely saturated. Plumb before backfilling and maintain plumb while working backfill around roots and placing layers above roots.
   3. Set container grown stock as specified for balled and burlapped stock, except cut cans on two sides. Carefully remove containers so as not to damage root balls.
   4. Move or set large specimen trees with crane or other recognized tree moving equipment.
   5. Plant Pits
      a. Around the perimeter of the plant pit, build a watering saucer 4 inches above the crown of the plant and shape and slope the surface away from the top of the saucer, approximately 18 inches wide down to existing grade.
      b. Treat entire plant pit or bed with herbicide in accordance with manufacturer's recommendations.

6. Mulching: Apply the specified mulch to a depth as shown on plans, evenly spread over the entire area of each soil basin or plant bed area.
7. Apply antidesiccant using power spray to provide an adequate film over trunks, branches, stems, and twigs for foliage. If deciduous trees or shrubs are moved in full-leaf, spray with antidesiccant at nursery before moving and again 2 weeks after planting.
8. Prune, thin out, and shape trees and shrubs in accordance with standard horticultural practice. Prune shrubs to retain natural character and accomplish their use in the landscape design. Required shrub sizes indicated or specified are the size after pruning.
9. Remove and replace excessively pruned or misformed stock resulting from improper pruning.
10. Paint cuts over 13 mm (1/2 inch) in size with standard tree paint or compound, covering all exposed, living tissue. Use paint which is waterproof, antiseptic, adhesive, elastic, and free of kerosene, coal tar, creosote, and other substances harmful to plants. Do not use shellac.
11. Guy and stake trees immediately after planting and as indicated.
12. Wrap tree trunks of 50-mm (2-inch) caliper and larger. Start at ground and cover trunk to height of first branches and securely attach. Inspect tree trunks for injury, improper pruning, and insect infestation. Take corrective measures required before wrapping.

3.05 INSTALLATION OF MISCELLANEOUS MATERIALS

A. Shredded Hardwood Mulch:
   1. Apply shredded hardwood mulch over the entire area of each soil basin, on all exposed soil surfaces within the perimeter of groupings or rows of trees or shrubs.
   2. The Contractor shall determine his own quantities based on the area, the work and site investigations.
   3. Provide a minimum depth per plans for all trees and shrubs.
B. Steel Edging: Install per plan locations following manufacturer requirements.
C. Filter Fabric: Install per plan locations following manufacturer requirements.
D. Ornamental Aggregate: Install per mow edge areas identified per plan.

3.06 MAINTENANCE

A. Begin maintenance immediately after planting. Maintenance shall continue until time of Substantial Completion, but in no case for less than a period of six months after Substantial Completion.
B. Maintain trees and shrubs by pruning, watering, cultivating, mulching, and weeding for healthy growth. Restore planting saucers. Tighten and repair stake and guy supports and reset trees and shrubs to proper grades or vertical position. Restore or replace damaged wrappings. Spray to keep trees and shrubs free from disease and insects when symptoms are shown. Plants shall be inspected at least once per week by the Contractor and needed maintenance performed promptly.
C. Remove and replace trees and shrubs found to be dying, dead, or in unhealthy condition during the warranty period. Make replacements during the growth season following end of warranty period. Replace trees and shrubs which are in doubtful condition at end of warranty period.

3.07 CLEAN-UP AND PROTECTION

A. During landscape work, keep pavements clean and work area in an orderly condition. Properly dispose of all resultant dirt, debris, and other waste material.

B. Protect landscape work and materials from damage due to landscape operations, operations by other Contractors and trades, and trespassers. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged landscape work as directed by the Landscape Architect at no additional cost, unless damage is the result of vandalism.
C. Disposal of Surplus and Waste Materials: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of it off the Owner's property.

3.08 OBSERVATION AND ACCEPTANCE

A. When landscape work is completed, including maintenance, Landscape Architect will, upon request, make an observation to determine acceptability.
    1. Landscape work may be observed for acceptance in portions as agreeable to Landscape Architect, provided each portion of work offered for observation is complete, including maintenance.
B. When observed landscape work does not comply with requirements, replace rejected work and continue specified maintenance until approved by Landscape Architect and found to be acceptable. Remove rejected plants and materials promptly from project site.
C. Trees, shrubs, groundcover, and all other specified plants are to be inspected to certify that all plants have been installed according to plans and are acceptable. Upon satisfactory completion of all replacements and repairs requested, Landscape Architect shall certify granting of Substantial Completion. The warranty will begin on the date of Substantial Completion. Contractor to continue maintenance of all plants for twelve months following Substantial Completion. At end of six 6) month maintenance period, Landscape Architect will inspect plants upon written request by Contractor. Any plant that is dead, or not in satisfactory health as determined by the Landscape Architect will be replaced by the Subs at no cost to the Owner. The Contractor will not be responsible for vandalism or theft.

END OF SECTION 32 93 00

SECTION 32 93 13 - GROUND COVER AND PLANTS

PART 1 - GENERAL

1.01 SUMMARY

A. This SECTION includes ground cover and plants as indicated on Drawings and in schedules. Types of plantings required include the following:
   1. Ground cover
   2. Container Grasses

1.02 REFERENCES

A. Applicable Standards:
   1. American National Standard Institute (ANSI):
      a. ANSI Z60.1 - American Standard for Nursery Stock.
   2. American Society for Testing and Materials (ASTM):
      a. A48/A48M - Gray Iron Castings.

1.03 SUBMITTALS

A. Submit as specified in DIVISION 01.

B. Product Certification: Submit certificates of inspection as may be required by governing authorities to accompany shipments. For standard products, submit manufacturer's certified analysis. For other materials, submit analysis by a recognized laboratory made in accordance with methods established by Association of Official Agricultural Chemists, wherever applicable.

C. Planting Schedule: Submit proposed planting schedule indicating anticipated dates and locations for each type of planting.

D. Maintenance Instructions: Submit instructions recommending procedures to be established by Owner for maintenance of ground cover and plants during entire year. Submit prior to expiration of required maintenance periods.

1.04 QUALITY ASSURANCE

A. Comply with applicable federal, state, county, and local regulations governing landscape materials and Work.

B. Employ only experienced personnel familiar with required Work.

C. Do not make substitutions of ground cover and plant materials. If required materials are not obtainable, submit proof on nonavailability to Landscape Architect, together with proposal for use of equivalent materials.

D. Provide quantity, size, genus, species, and variety of plants as indicated and scheduled and complying with applicable requirements of ANSI Z60.1.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Do not deliver plants until site conditions are ready for planting. If planting is delayed, heel-in bare rooted or freshly dug plants in bed containing adequate peat moss, or other suitable moisture holding material, to keep roots moist. Separate bundles and trim roots, if long or damaged, using sharp pruning shears. Place plants in flats, pots, or other containers in sheltered location protected from sun, wind, and mechanical damage. Keep roots moist using fine mist spray.

PART 2 - PRODUCTS

2.01 PLANT MATERIALS

A. Ground Cover: Established and well-rooted in pots or similar containers, complying with ANSI Z60.1 and following requirements:
   a. Pot size of 56 mm (2-1/4 inches) with minimum of two runners, not less than 100 mm (4 inches) long.
   b. Pot size of 75 mm (3 inches) with minimum of three runners not less than 150 mm (6 inches) long.
   c. Pot size of 100 mm (4 inches) with minimum of four runners not less than 200 mm (8 inches) long.

B. Container Grasses: Healthy, field-grown plants from a commercial nursery.
   a. Refer to schedule on planting plans, for type, size and condition

2.02 TOPSOIL

A. Soil Mix: ASTM D 5268, pH range of 5.5 to 7, 4 percent organic material minimum, free of stones 1/2 inch or larger in any dimension, subsoil, clay lumps, roots, brush, weeds, weed seed, and other extraneous or toxic materials harmful to plant growth. Mix shall contain maximum soluble salts of 500 PPM.

B. Soil Source: Reuse surface soil stockpiled on the site. Verify suitability of surface soil to produce topsoil meeting requirements and amend when necessary. Supplement with imported topsoil when quantities are insufficient. Clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth.

2.03 SOIL AMENDMENTS

A. Spaghnum Peat Moss: Peat moss shall be Canadian Sphagnum Peat Moss, which is a light brown, fluffy material. Do not use hypnum, Michigan, or reed sedge peats.

B. Mulch for planting beds: Double ground aged shredded hardwood mulch that is free from deleterious materials shall be used for top dressing of planting areas. Size of particles may vary from minimum of ¼ inch to maximum of 2 inches, within planting bed areas.

2.04 MISCELLANEOUS MATERIALS

A. Pre-Emergent Herbicide. Provide pre-emergent herbicide Pre M 60 DG (granular). The Landscape Architect will consider an “equivalent” of the brand name specified. Provide the Landscape Architect with a complete description, literature, test reports, etc. on the proposed “equivalent”. The burden of proof regarding the “equivalent” is upon the Contractor. The Landscape Architect will accept the pre-emergent herbicide based on brand name and visual inspection for condition.

2.05 BIOSTIMULANT

A. The Contractor shall utilize an organic, biological fungi for soil prep. The material shall be granular and applied per manufacturer’s recommendation from Myke.

PART 3 - EXECUTION

3.01 PREPARATION OF PLANTING BEDS

A. Prepare planting beds after frost has left ground and when relatively dry.

B. Loosen subgrade of planting bed areas to minimum depth of 6 inches using a cultimulcher or similar equipment. Remove stones over 1/2 inches in any dimension, and sticks, rubbish, and other extraneous matter.
C. Mix soil amendments and fertilizers with topsoil at rates specified. Delay mixing of fertilizer if planting will not follow placing of planting soil within a few days.
D. Spread planting soil mixture to minimum depth required to meet lines, grades, and elevations shown, after light rolling and natural settlement. Do not place frozen material, or place soil if subgrade is frozen. Place approximately one-half of the total amount of planting soil required. Work into top of loosened subgrade to create a transition layer, then place remainder of the planting soil.

3.02 INSTALLATION OF PLANT MATERIALS

A. Layout individual ground cover, plant locations, and areas for multiple plantings. Stake locations, outline areas, and secure Landscape Architect's acceptance before starting planting work. Make minor adjustments to layout as may be requested by Landscape Architect. B. Plant Installation, Including Ground Cover:
   1. Space plants as indicated, scheduled, or specified.
   2. Dig holes large enough to allow for spreading of roots. Backfill with planting soil.
   3. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.
   4. Water thoroughly after planting, taking care not to cover crowns of plants with wet soil.
   5. Protect from hot sun and wind; remove protection when plants show evidence of recovery from transplanting shock.
   6. Mulch areas between plants in areas per plans and according to details for depth of mulch cover.

3.03 INSTALLATION OF MISCELLANEOUS MATERIALS

A. Install edging where indicated. Anchor with steel stakes spaced not more than 1 meter (3 feet) oc and drive at least 25 mm (1 inch) below top elevation of edging.
B. Place mulch and geotextile fabric as indicated. Compact soil subgrade before placing gravel. Fill or remove excess soil to bring indicated thickness of bed to required elevation:

3.04 MAINTENANCE

A. Maintain plants by watering, weeding, fertilizing, and other operations to establish healthy, viable plantings for a period of 6 months after Substantial Completion.
B. Remove and replace ground cover and plants found to be dead or in unhealthy condition during the warranty period. Make replacements during growth season following end of maintenance period. Replace ground cover and plants which are in doubtful condition at end of maintenance period; unless, in opinion of Landscape Architect, it is advisable to extend warranty period for a full growing season.

END OF SECTION 32 93 13

SECTION 33 01 30.19 - TEMPORARY BYPASS PUMPING SYSTEMS FOR SEWER PIPELINES

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes requirements for implementing a temporary pumping system for the purpose of diverting existing sewage flow around work area as needed.

B. The Contractor is required to furnish all materials, labor, equipment, power, maintenance, planning, permitting, etc., to implement a temporary pumping system for the purpose of diverting the existing sanitary sewer flows around the work area.

C. The design, installation, and operation of the temporary pumping system shall be the Contractor's responsibility.

D. The bypass system shall meet the requirements of all codes and regulatory agencies having jurisdiction.

E. The bypass system is proposed at the existing Todd Creek interceptor to maintain service to the existing interceptor during the tie-in to the proposed Todd Creek Wastewater Treatment Plant.

1.02 QUALITY ASSURANCE:

A. Follow national standards and as specified herein.

B. Perform leakage and pressure tests on discharge piping using clean water before operation. Notify Engineer twenty-four (24) hours prior to testing.

C. Maintain and inspect temporary pumping system every two (2) hours. Responsible operator must be on site when pumps are operating.

D. Keep and maintain spare parts for pumps and piping on site, as required.

E. Maintain adequate hoisting equipment and accessories on site for each pump.

1.03 BYPASS PUMPING PLAN:

A. The Contractor shall prepare a specific, detailed description of the proposed pumping system (Bypass Pumping Plan).

B. The Bypass Pumping Plan shall be submitted and accepted prior to the mobilization of any of the equipment included in the Bypass Pumping Plan.

C. The plan shall include but not limited to the following details:

1. Plan indicating location of bypass pumping lines, pumps, and generators
2. Staging areas for pumps
3. Sewer plugging method and types of plugs
4. Number, size, material, location, and method of installation of suction piping and discharge piping
5. Bypass pump sizes, capacity, and number of each size to be on site and power requirements
6. Calculations of static lift, friction losses, and flow velocity (pump curves showing pump operating range shall be submitted)
7. Standby power generator size and location
8. Downstream discharge plan
9. Procedures to monitor upstream mains for backup impacts
10. Method of protecting discharge manholes or structures from erosion and damage
11. Thrust and restraint block sizes and locations
12. Sections showing suction and discharge pipe depth, embedment, select fill and special backfill
13. Method of noise control for each pump and/or generator
14. Any temporary pipe supports and anchoring required

15. Design plans and computation for access to bypass pumping locations indicated on the drawings
16. Calculations for selection of bypass pumping pipe size
17. Schedule for installation of and maintenance of bypass pumping lines
18. Emergency plan detailing procedures to be followed in event of pump failures, sewer overflows, service backups, and sewage spillage.
    a. Maintain copy of emergency plan on site for duration of project.

1.04 DELIVERY AND STORAGE:

A. Transport, deliver, handle, and store pipe, fittings, pumps, ancillary equipment and materials to prevent damage and follow manufacturer's recommendations.
B. Inspect all material and equipment for proper operation before initiating work.
C. Material found to be defective or damaged due to manufacturer or shipment.
    1. Repair or replacement of defective or damaged material and equipment will be at no cost to Owner.

PART 2 - PRODUCTS

2.01 PUMPS:

A. Temporary bypass pumping shall be a continuous operation. Interruptions due to power outages or any other reason shall not be permitted.
B. All pumps used shall be fully automatic, dry-prime, self-priming units that do not require the use of foot-valves or vacuum pumps in the priming system.
C. The pumps may be electric or diesel powered.
D. All pumps used must be constructed to allow dry running for long periods of time to accommodate the cyclical nature of effluent flows.
E. The Contractor shall provide the necessary stop/start controls for each pump.
F. The Contractor shall include one (1) stand-by pump of each size to be maintained on site.
    1. Back-up pumps shall be on-line, isolated from the primary system by a valve.

2.02 DISCHARGE AND SUCTION PIPING:

A. To prevent the accidental spillage of flows all discharge systems shall be temporarily constructed of rigid pipe with positive, pressure tight, restrained joints.
B. Discharge hose will only be allowed in short sections and by specific permission from the Engineer.
C. Flexible Hoses and Associated Couplings and Connectors:
    1. Abrasion resistant.
    2. Suitable for intended service.
    3. Rated for external and internal loads anticipated, including test pressure.
    4. When subject to traffic loading, compose system, such as traffic ramps or covers.
        a. Install system and maintain H-20 loading requirements while in use or as directed by the Engineer.

2.03 DESIGN REQUIREMENTS:

A. The Contractor shall establish adequate bypass pumping adherent to the conditions in this Specification and anticipate severe weather conditions and increases in peak flows during rain and/or snowmelt events.
    1. Expected max day flow is 5.55 MGD.

B. Available flow data provided (if any), is provided only to the extent such information has been made available to or discovered by the Engineer. It is expected that flow rates have changed since the time data was collected. This information is shown for the convenience of the Contractor but is not guaranteed to be either correct or complete and all responsibility for the accuracy and completeness thereof is expressly disclaimed by Owner and Engineer. The Contractor shall make investigation as necessary to verify correctness and completeness. The Contractor shall, ahead of submitting the Bypass Pumping Plan, verify the actual flow rates of the sanitary sewer segments and designing systems for the actual expected peak flows (including during storm events).
   1. Contractor shall be responsible for coordinating the measurement of primary effluent flows and locations with the Owner.
   2. The Contractor shall provide all pipeline plugs and pumps of adequate size to handle peak flow and temporary discharge piping to ensure that the total flow of the main can be safely diverted around the section to be repaired.
   3. The pumping system shall be of adequate capacity and size to handle at least two (2) times the maximum day flow.
   4. Bypass pumping system shall be designed to be operated twenty-four (24) hours per day.
   5. The Contractor shall have adequate standby equipment available and ready for immediate operation and use in the event of an emergency or breakdown.
      a. One (1) standby pump for each size pump utilized shall be installed at the mainline flow bypassing locations, ready for use in the event of primary pump failure.
   6. Bypass pumping system shall be capable of bypassing the flow around the work area and of releasing any amount of flow up to full available flow into the work area as necessary for satisfactory performances of work.
   7. The Contractor shall make all arrangements for bypass pumping during the time when the main is shut down for any reason. System must overcome any existing force main pressure on discharge.

C. Performance Requirements:
   1. It is essential to the operation of the existing sewerage system that there be no interruption in the flow of sewage throughout the duration of the project.
      a. To this end, the Contractor shall provide, maintain, and operate all temporary facilities such as dams, plugs, pumping equipment (both primary and back-up units as required), conduits, all necessary power, and all other labor and equipment necessary to intercept the sewage flow before it reaches the point where it would interfere with the work, carry it past the Work and return it to the existing sewer downstream of the Work.
   2. The design, installation, and operation of the temporary pumping system shall be the Contractor's responsibility.
   3. The bypass system shall meet the requirements of all codes and regulatory agencies having jurisdiction.
   4. The Contractor shall provide all necessary means to safely convey the sewage past the work area. The Contractor will not be permitted to stop or impede the main flows under any circumstances.
   5. The Contractor shall maintain sewer flow around the work area in a manner that will not cause surcharging of sewers, damage to sewers, and that will protect public and private property from damage and flooding.
   6. The Contractor shall protect water resources, wetlands, and other natural resources.

PART 3 - EXECUTION

3.01 FIELD QUALITY CONTROL AND MAINTENANCE:

A. Pressure and Leakage Test:
   1. The Contractor shall perform leakage and pressure tests of the bypass pumping discharge piping using clean water prior to actual operation
      a. A hydrostatic (water) test shall be performed.
      b. Air testing is not an allowable alternative.
   2. The Engineer shall be given at least twenty-four (24) hours' notice prior to testing.
   3. The pressure and leakage test shall be conducted at one-and-a-half times (1.5x) the maximum pressure the system will experience based on the approved Bypass Pumping Plan for a:
      a. Duration of test shall be for a minimum of two (2) hours.

3.02 MONITORING:

A. A responsible monitoring person shall be present when pumps are operating.
   1. The monitoring person shall be properly trained, experienced, and mechanically qualified such that they can quickly and effectively address any potential emergency and non-emergency situations associated with the pumps and bypass pumping system.

3.03 PREPARATION:

A. Precautions:
   1. Contractor is responsible for locating any existing utilities in the area the Contractor selects to locate the bypass pipelines.
   2. The Contractor shall locate bypass pipelines to minimize any disturbance to existing utilities and roadways and shall obtain approval of the pipeline locations from the Engineer.
   3. All costs associated with relocating utilities, closing roads, traffic control, and obtaining all approvals shall be paid by the Contractor.
   4. During all bypass pumping operation, the Contractor shall protect associated Pumping Stations from damage inflicted by any equipment.
      a. The Contractor shall be responsible for all physical damage to associated Pumping Stations caused by human or mechanical failure.

3.04 INSTALLATION AND REMOVAL:

A. The Contractor may remove manhole sections, make connections to the existing sewer, or construct temporary bypass pumping structures only at the access location indicated on the accepted bypass pumping/piping plans.
B. Plugging or blocking of sewage flows shall incorporate a primary and secondary plugging device.
C. When plugging or blocking is no longer needed for performance and acceptance of the Work, it is to be removed in a manner that permits the sewage flow to slowly return to normal without surge, to prevent surcharging or causing other major disturbances downstream.
D. When working inside manhole, sewer lines, or other confined spaces, the Contractor shall exercise caution and comply with OSHA requirements.
E. When the bypass pipeline must cross roads, streets, or driveways, the Contractor must arrange so that at no time, shall bypass pumping or piping systems restrict access to traffic.
   1. The Contractor is responsible for obtaining any approvals for placement of the temporary pipeline within public ways from the appropriate jurisdictional authority.
   2. This may require burying the bypass piping or the use of "road plates".

F. Upon completion of the bypass pumping operations, the Contractor shall remove all plugs, pumps, and piping that was required for the operations.
G. Contractor shall restore all property to pre-construction condition.

3.05 NOTIFICATION:

A. The Contractor shall immediately notify the Owner should a sanitary sewer overflow (SSO) occur and take the necessary action to clean up and disinfect the spillage to the satisfaction of the Owner and/or other governmental agency.

END OF SECTION 33 01 30.19

SECTION 33 11 00 – PRESSURE PIPE

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes all pressure pipe, fittings, specials, and appurtenances.

B. Related Work Specified Elsewhere:

1. Section 09 90 00 - Protective Coatings.
2. Section 33 12 16 - Utility Valves and Accessories.
3. Section 33 31 50 - Pipe Installation.

1.02 REFERENCE STANDARDS:

A. Applicable Standards:

1. American Association of State Highway and Transportation Officials (AASHTO).
2. American Water Works Association (AWWA):
   a. C104 - Cement-Mortar Lining for Ductile Iron Pipe and Fittings for Water.
   b. C110 - Ductile Iron and Gray-Iron Fittings.
   c. C111 - Rubber-Gasket Joints for Ductile Iron Pressure Pipe and Fittings.
   d. C115 - Flanged Ductile Iron Pipe with Ductile Iron or Gray-Iron Threaded Flanges.
   e. C150 - Thickness Design of Ductile Iron Pipe.
   f. C151 - Ductile Iron Pipe, Centrifugally Cast, for Water.
   g. C153 - Ductile Iron Compact Fittings.
   h. C200 - Steel Water Pipe 6 Inches and Larger.
   i. C205 - Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4 Inch and Larger - Shop Applied.
   j. C207 - Steel Pipe Flanges for Waterworks Service, Sizes 4 Inch Through 144 Inch.
   k. C208 - Dimensions for Fabricated Steel Water Pipe Fittings.
   l. C209 - Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines.
   m. C210 - Liquid-Epoxy Coatings and Linings for Steel Water Pipe and Fittings.
   n. C213 - Fusion-Bonded Epoxy Coating for the Interior and Exterior of Steel Water Pipelines.
   o. C214 - Tape Coating Systems for Steel Water Pipe.
   p. C215 - Extruded Polyolefin Coatings for Steel Pipe.
   q. C218 - Liquid Coating Systems for the Exterior of Aboveground Steel Water Pipelines and Fittings.
   r. C219 - Bolted, Sleeve-Type Couplings for Plain-End Pipe.
   s. C220 – Stainless Steel Pipe ½ inch and Larger
   t. C303 - Concrete Pressure Pipe, Bar-Wrapped, Steel-Cylinder Type.
   u. C304 - Design of Prestressed Concrete Cylinder Pipe.
   v. C606 - Grooved and Shouldered Joints.
   w. C900 - Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings.
   x. M11 - Steel Pipe - A Guide for Design and Installation.
   y. M23 - PVC Pipe-Design and Installation.
   z. M41 - Ductile Iron Pipe Fittings.
3. American National Standards Institute (ANSI):
   a. B16.1 - Gray Iron Pipe Flanges and Flanged Fittings: Classes 25, 125, and 250.
   b. B16.21 - Nonmetallic Flat Gaskets for Pipe Flanges.
   c. B16.5 – Pipe Flanges and Flanged Fittings
   d. B36.19 – Stainless Steel Pipe
4. ASTM International (ASTM):

a. A307 - Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60000 PSI Tensile Strength.
b. A312 – Standard Specification for Seamless and Welded Austenitic Stainless Steel Pipe
c. A403 – Standard Specification for Wrought Austenitic Stainless-Steel Pipe
d. A733 – Standard Specification for Welded and Seamless Carbon Steel and Austenitic Stainless-Steel Nipples
e. A774 – Standard Specification for Stainless-Steel Pipe Fittings
f. B88-03 - Standard Specification for Seamless Copper Water Tube.
g. D1248 - Standard Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable.
h. F477 - Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
i. G62 - Standard Test Methods for Holiday Detection in Pipeline Coatings.

5. Federal Specification (FS):
   a. WW-T-799 - Tube Copper, Seamless, Water.
6. National Sanitation Foundation (NSF):
   a. 61 - Drinking Water System Components - Health Effects.
7. Society for Protective Coatings (SSPC):
   a. SP1 - Solvent Cleaning.
   b. SP3 - Power Tool Cleaning.
   c. SP5 - White Metal Blast Cleaning.
   d. SP7 - Brush-Off Blast Cleaning.
   e. SP10 - Near-White Blast Cleaning.
8. American Welding Society (AWS)
9. International Organization for Standardization (ISO)
10. Compressed Gas Association

1.03 SUBMITTALS:

A. Submit as specified in Division 1.
B. Submit the following for acceptance prior to fabrication:
   1. Pipe and joint details.
   2. Special, fitting, and coupling details.
   3. Laying and installation schedule.
   4. Specifications, data sheets, and affidavits of compliance for protective shop coatings and linings.
   5. Manufacturer's design calculations including, but not limited to, wall thickness and deflection under specified live and dead loads.
C. Certificates and Affidavits: Furnish the Following Prior to Shipment:
   1. Affidavit of compliance with applicable standard.
   2. Certificate or origin for all steel flanges. Flanges shall be manufactured in the U.S.A.
   3. Test certificates.

1.04 QUALITY ASSURANCE:

A. Manufacturers shall be experienced in the design and manufacture of pipe, fittings, specials, or appurtenances.
B. All pipe manufactured to AWWA C200 series specifications shall be furnished by a manufacturer certified by the Steel Plate Fabricators Association (SPAA) for steel pipe fabrication.

C. All grooved joint couplings, fittings, valves, and specialties shall be the products of a single manufacturer.
D. All castings used for coupling housings, fittings, valve bodies, etc., shall be date stamped for quality assurance and traceability. No refurbished material shall be used.

1.05 DELIVERY, STORAGE AND HANDLING:
1. Deliver, store, and handle equipment and materials as specified in Division 1.

PART 2 - PRODUCTS

2.01 PIPE REQUIREMENTS:
A. Furnish pipe of materials, joint types, and sizes as indicated or specified.
B. Pipe shall be designed to withstand all stresses resulting from external loads and internal pressures listed in the table below unless otherwise specified:

Location	Nominal Pipe Size, in	Above Grade Pipe Material	Buried Below Grade Material	Expected Max Working Pressure, psi	Design Max Test Pressure, psi
Screened Influent	20	DIP	DIP or PVC	100	150
Influent Screen Bypass	20	DIP	--	100	150
AGS Influent / Degritted Influent	30	DIP	DIP or PVC	13	20
Grit Slurry	4	DIP	--	33	50
AGS -– Water Level Correction Return	6	DIP	--	33	50
AGS – Sludge Buffer Supernatant Return	8	DIP	--	33	50
AGS – Sludge Buffer WAS Transfer to WAS Holding	4	DIP	DIP or PVC		50

Location	Nominal Pipe Size, in	Above Grade Pipe Material	Buried Below Grade Material	Expected Max Working Pressure, psi	Design Max Test Pressure, psi
ByPass Bypass Thickening to Thick Sludge Holding Tanks	6	DIP	DIP or PVC	33	50
Thickened Sludge Transfer to Thick Sludge Holding Tanks	4	DIP	-----	100	150
Sludge Haul Off Pump Suction	10	DIP	------	20	30
Sludge Haul Off Pump Discharge	8	DIP	DIP--	100	150
AGS Blower Suction Header	24	CS	------	3	5
AGS Air Supply Header	24	CS	------	13	20
AGS Air Supply Dropleg	12	CS	------	13	20
Process Air for Pressurizing WAS Drawoff PipeAGS Air Seal	4	CS	-----	13	20
Thin WAS Blower Suction Header	14	CS	-----	3	5
Thin WAS Blower Supply Header	10	CS	-----	13	20

Location	Nominal Pipe Size, in	Above Grade Pipe Material	Buried Below Grade Material	Expected Max Working Pressure, psi	Design Max Test Pressure, psi
Air Supply-Compressed Air for Large Bubble Mixing for Thickened Sludge Tanks	1.5	SST	-----	100	150
Process Water	4	PVC	PVC	133	200
Sludge	4	DIP	DIP or PVC	33	50
Hydrogen Peroxide Chemical Piping	½"	--	SST	100	150

C. Pipe Marking: All pipe and fittings shall be marked conforming to the applicable standard specification under which the pipe is manufactured and as otherwise specified.

2.02 DUCTILE IRON PIPE:

A. Design and Manufacture of Pipe:
   1. Ductile iron pipe shall conform to AWWA C115, C150 and C151 except as otherwise specified.

B. Dimensions: The minimum thickness as defined by pressure class for mechanical or push-on-type joint ductile iron pipe shall be as described in pipe schedule.
   1. Minimum thickness for ductile iron pipe threaded for screw-on flanges shall be in accordance with AWWA C115.
   2. Pipe with grooved barrel for any type of restrained joint shall have wall thickness increased to provide a minimum wall thickness conforming to AWWA C606 Joints:

C. Joints:
   1. Mechanical and Push-On Type:
      a. Provide mechanical or push-on-type joints for all buried pipe less than 750 mm (30 inches) in diameter unless otherwise specified or indicated. Provide push-on-type joints for sizes 750 mm (30 inches) in diameter and greater.
      b. Joints shall conform to AWWA C111.
   2. Flanged:
      a. Provide flanged joints for all interior and exposed exterior pipe except where otherwise specified or indicated.
      b. Flanges for pipe shall be ductile iron and conform to the applicable provisions of AWWA C110 and C115 and shall be drilled ANSI B16.1 Class 125.
      c. Victaulic type couplings and fittings may be used in lieu of flanged joints. Pipes shall be radius grooved as specified for use with the Victaulic couplings.
   3. Grooved:

a. Provide ductile iron pipe, minimum Class 53, grooved in accordance with AWWA C606. Rigid radius groove dimensions shall be utilized where flexibility is neither required nor desired.
b. Grooved couplings shall be manufactured in two or more segments of cast ductile iron. Gaskets shall be pressure-responsive flush seal type and the elastomeric material (grade) shall be verified as suitable for the intended service. Victaulic Style 31 or engineer approved equal.
c. Grooved flange adapters may be used with AWWA grooved end pipe and fittings, for mating to ANSI Class 125 flanged components. Victaulic Style 341 or engineer approved equal.
d. Grooved couplings may be used as unions or dismantling joints.

4. Sleeved or Coupled:
   a. Provide for sleeves or couplings where indicated.
   b. Furnish pipe ends suitable for receiving style of sleeve or coupling indicated or specified.
   c. Provide anchored couplings where restraint is required to withstand specified operating or hydrostatic test pressure and where indicated.
5. Restrained:
   a. Furnish for all fittings and where joint restraint is required to offset internal pipeline forces.
   b. Provide restrained joints of following approved types:
      (1) Restrained mechanical joint.
      (2) Cut grooved type for rigid joint conforming to AWWA C606.
      (3) Restrained push-on joint.
   c. Mechanical joint retainer glands may be used where joint restraint is required unless otherwise indicated. When indicated, retainer glands shall be Megalug manufactured by EBAA Iron, Inc. or Engineer approved equal.

D. Fittings:
1. Fittings shall conform to AWWA C110 or C153 and shall have a pressure rating of not less than that specified for pipe.
2. Fittings shall be ductile iron.
3. Fittings for pipe with mechanical joint shall have mechanical joints.
4. Fittings for pipe with push-on joints shall be mechanical joint.
5. Fittings for pipe with grooved type joint shall have cut grooved type rigid joints per AWWA C606.
6. Include all specials, taps, plugs, flanges, and wall fittings as required.
7. Provide openings for air valve, drain, sampling, sensing, testing, and other connections with threaded bosses or flange outlets sized and located where indicated.

E. Lining for AGS Effluent, and UV Disinfection Wastewater:
1. All pipe and fittings for shall be cement-mortar lined in accordance with AWWA C104.
2. Refer to Process & Instrumentation Diagrams (P&IDs). Pipe labeled “DIP-C” shall be cement-mortar lined.

F. Lining for Grit Slurry Line as indicated in drawings:
1. Pipe and Fittings:
   a. All pipe and fittings shall be glass lined in accordance with ASTM B1000-15.
   b. The glass lining applied to pipe and fittings shall be hard, smooth, continuous vitreous material which is formulated to prevent the adherence of grease in sludge and scum lines, and to resist the adherence of crystalline metal salt deposits (Struvite and Vivionite) to sludge in sewage and wastewater treatment plants.

c. The glass lining, as supplied from the manufacturer, shall have a density of 2.5 to 3.0 grams per cubic centimeter as measured by ASTM D-792.
d. The entire finished coating shall be a minimum of 10 mils (0.010 inch) as tested with an acceptable Type I or Type II dry film thickness gage as described in ASTM D7091.
e. The finished lining shall be able to withstand a strain of 0.001 inch/inch of the base metal without visible damage to the glass.
f. The glass lining shall have a minimum hardness of 5 on the MOHS hardness scale.
g. The lining shall be capable of withstanding an instantaneous thermal shock from 350°F differential without visible crazing, blistering or spalling.
h. The lining shall be resistant to corrosion of between pH3 and pH10 at 125°F. There shall be no visible loss of surface gloss to the lining after immersing a production sample in an 8 percent sulfuric acid solution at 148 °F for a period of 10 minutes.
i. Factory Testing:
(1) Visual Inspection: The lining shall be of a light, bright color to allow visual detection of defects more easily prior to electronic holiday detection testing. opaque window glass. Pieces with visible pinholes, crazing or fishscales which expose metal shall be rejected.
(2) "Spark Test": The manufacturer shall test all pipe and fittings with a low voltage, wet sponge, non-destructive holiday detection unit. The procedure and acceptance criteria shall be per MP-9.2, Porcelain Enamel Continuity Testing.
(a) The pipe or fitting tested shall be rejected from shipment if testing reveals more than isolated voids due to casting irregularities which represent more than 0.01 percent of the total glassed surface area. Microscopic pinholes detected by the spark test shall be limited to 2 per fitting and 5 per 20 feet of pipe barrel.
(b) Upon request by the Engineer, the manufacturer shall perform jobsite test verification.
(3) Certificates: The manufacturer shall provide certified copies of the test results accompanying each shipment. The test forms shall identify each item by mark number and description and show date of test, inspector identity, and test results.

2. Refer to Process & Instrumentation Diagrams (P&IDs). Pipe labeled "DIP-G" shall be glass lined.

G. Lining for Process, and Raw Wastewater Influent, unless specified elsewhere:
1. Pipe and Fittings:
a. All piping and fittings shall be lined with an amine-cured novalac epoxy containing a minimum of 20% by volume of ceramic quartz pigment. The lining shall be Protecto 401 as manufactured by INDURON Protective Coatings, Birmingham, Alabama or NovoCoat SP-2000W as manufactured by NovoCoat Protective Coatings, Addison, Texas, or approved equal
b. Surface preparation shall consist of grit-shot blasting or sandblasting surface to near-gray finish, comparable to SSPC-SP10.
c. Lining shall be applied within 8 hours of surface preparation. The number of coats of lining applied and the time between coats shall be as recommended by the lining manufacturer.
d. Total Thickness: A nominal 40 mils.

e. Joint surface coating shall be Protecto Joint Compound with Protecto 401 lining system or Novo Coat SP-2000W with Novo Coat lining system. Coal tar is prohibited. Total thickness shall be 6 mils nominal and 10 mils maximum. Flange faces shall not be coated.

f. Testing:

(1) Lining shall be tested over 100% of the pipe barrel and fitting surface with a nondestructive 4,000-volt test.

(2) All holidays shall be repaired per lining manufacturer's recommendation.

(3) A voltage confirmation test shall be performed for each production shift or change in detector operator.

2. Refer to Process & Instrumentation Diagrams (P&IDs). Pipe labeled "DIP-E" shall be epoxy lined.

H. Coating:

1. All iron pipe and fittings shall be coated with manufacturer's standard bituminous paint coating.
2. Flange faces shall be coated in accordance with AWWA C115.

2.03 CARBON STEEL AERATION PIPE:

A. Carbon steel aeration pipe shall be used for interior and exterior piping.

1. All piping, gaskets, couplings, and coatings shall be rated for a temperature of 300 degrees Fahrenheit.
2. Schedule: STD for all pipe sizes.

B. Pipe shall be spiral-weld steel pipe ASTM A139 Grade B21000, STD schedule for all pipe sizes with wall thickness continuous spiral seam welded on inside and outside of pipe, manufactured by Naylor Pipe Company, Armco, or approved equal.

C. Indoor air piping shall be insulated as specified in DIVISION 23.

D. Joints: Shop butt-welded, grooved, or flanged where indicated. Flanges shall be in accordance with ANSI B16.1. Grooved joints shall be in accordance with AWWA C606.

E. Coating: Exposed exterior and exposed interior pipe shall be coated as specified in DIVISION 09.

F. Lining: None.

G. Design of Pipe: Design shall conform to AWWA C200, AWWA M11, and as specified except that hydrostatic test of fitting after fabrication will not be required. Fittings shall be tested by dye penetrant method.

1. Size Indicated or specified shall mean the nominal pipe size.
2. Minimum wall thickness shall be not less than 3/16".

H. Joints:

1. Flanged:
   a. Provide flanged joints for all interior and exposed exterior pipe except where otherwise specified or indicated.
   b. Joints shall conform to AWWA C200 and AWWA C207.
   c. Flanges shall have a pressure rating not less than that required for pipe. Flanges shall be Class D and be drilled ANSI B16.1 Class 125.
   d. Pipe with AWWA C606 grooved type joints may be substituted for Class D flanged pipe.
2. Grooved:
   a. Steel pipe shall be provided with roll-grooved ends per coupling manufacturer's current listed standards.

b. Grooved coupling gaskets for use on aeration piping shall be Grade L Silicone, rated to 350 degrees Fahrenheit.
c. Rigid grooved coupling shall be used to provide system rigidity and support in accordance with ANSI B31.1. Victaulic Style 07/W07 or approved equal.
d. Flexible grooved couplings may be used in locations where thermal movement accommodation and stress relief are required. Victaulic Style 77/W77 or approved equal.

3. Shop welded:
   a. Provide pipe prepared for beveled ends for field-butt welding as indicated or required.
   b. Perform welding by welders qualified in accordance with ANSI B31.1 Paragraph 127.5. Weld piping with wall thickness up to 0.125in with the TIC (GTAW) process. Distribute smooth and evenly weld deposit and provide a crown of no more than 1/16-in on the I.D. and 3/32-in on the O.D. of the piping. Concavity, undercut, cracks, or crevices are not acceptable. Remove excessive weld deposits, slag, spatter, and projections by grinding. Wire-brush outside weld area with brushes of stainless steel that are specifically designed to be used only on stainless steel.
   c. Air Service Coupling:
      (1) Victaulic Style 234 of ASTM A36 carbon steel construction with silicone gasket.
         (a) Restrained type.
         (b) Carbon steel bolts, ASTM A668.
         (c) Maximum pressure: 25 psig.
   d. Air Service Expansion Joint Couplings:
      (1) Victaulic Style 231 Expansion Coupling with silicone gasket.
         (a) Minimum 2” of axial movement accommodation.
         (b) Coupling manufacturer to verify coupling placement and pipe support locations.
      (2) -approved equal.
   e. Pipe supports: see drawings.

2.04 STAINLESS STEEL PIPE:

A. Stainless steel pipe shall be used for all buried air piping and hydrogen peroxide feed tubing.
   1. All aeration piping, gaskets, couplings, and coatings shall be rated for a temperature of 300 degrees Fahrenheit.
   2. Design temperature for hydrogen peroxide stainless steel tubing shall be -20 degrees Fahrenheit to 150 degrees Fahrenheit.
   3. Size indicated or specified shall mean the nominal pipe size.
   4. All pieces shall be clearly marked with gage and type of stainless steel.
   5. Aeration Piping material:
      a. Materials: Type 304 Stainless Steel.
      b. Schedule: STD for all pipe sizes.
      c. Joints: Shop butt welded, flanged where indicated. Flanges shall be in accordance with ANSI B16.1.
      d. Coating: None.
      e. Lining: None.
   6. Hydrogen Peroxide Feed Tubing:
      a. Materials: Type 304 Stainless Steel

b. Schedule: Minimum thickness of 0.035 inches
c. Joints: Socket Weld with Swagelok fittings
d. Coating: None
e. Lining: None

7. Hydrogen Peroxide Carrier Pipe:
   a. Materials: Type 304 Stainless Steel
   b. Schedule: Schedule 10S Minimum
   c. Joints: Shop Butt welded, flanged where indicated. Flanges shall be in accordance with ANSI B16.1.
   d. Coating: None
   e. Lining: None
8. Pipe and fittings used shall be either seamless or welded, austenitic stainless steel Grade 304, conforming respectively to ASTM A312 and ANSI B36.19 and ASTM A403, ANSI B16.9, and shall be suitable for air pipe.
   a. Pipe shall be fabricated by die forming or rolling true to dimension and round within a tolerance of plus or minus 1/16-in. The two edges of sheet shall be brought to line so as not to leave a shoulder on the inside of the pipe. Ends of pipe and fittings shall be perpendicular to the longitudinal axis. Pipe shall be straight within maximum of 1/8-in deviation over 10 feet. All pieces shall be clearly marked with gage and type of stainless steel.
   b. All the pulled tee outlets must be true and perpendicular to the center line axis of the manifolds. Alignment tolerances for centerline of all Pulled Tee outlets and also the centerline of the manifolds to the end of the outlets shall be 1/32-in and shall not be accumulative. The Pulled Tee radius shall be in accordance to ASME B31.1. All Victaulic grooved ends must be suitable for the design pressure.
   c. All welding of pipe, fittings, and subassemblies shall be complete in the factory. Welding shall be performed by qualified welders in accordance with ANSI B31.1 with standard procedures for the application, by the shielded arc, inert gas, MIG or TIG method. Filler wire shall be added to all welds to provide for a cross section and weld metal equal to or greater than the parent metal. Weld deposit shall be smooth, evenly distributed and have a crown of no more than 1/16-in on both sides of the weld. No cracks or crevices shall be allowed. Butt welds shall have full penetration to the interior and exterior of the joint. Excessive weld deposits, slag, spatter, and projections shall be removed by grinding. After all fabrication is completed, all pipe spools shall be pickled and passivated by complete immersion in a solution containing 3% hydrofluoric or citric acid and 6-10% nitric acid with the balance of water and then followed by a fresh water rinse bath. Alternative methods will not be allowed. All pipe spools shall be free of surface iron upon completion of this process. All openings shall be capped after the pickling/passivating process to protect to the inside of the spools from debris and dirt.
   d. Joints for field assembly shall be flanged, grooved, or sleeve type coupling. Pipe components may be shop welded into assemblies for field installation. Flange joints or flange adaptors shall be used at connections to equipment, fittings, and valves. Sleeve type couplings and flange adaptor couplings shall be used as required to allow for expansion, for disassembly of piping, state pipe length for disassembly, for servicing and pipeline flexibility. All other joints shall be welded. Additional flanged, grooved or sleeve type coupling joints shall be provided as required to join welded shop assemblies and allow for installation of shop assemblies into the

structure. All additional flanged, grooved, or sleeve coupling joints required to install and assemble the piping system shall be furnished as part of the work of this Section.

(1) All flanged joints shall be made up with 316L slip-on type with 150 class flanges suitable for the internal design pressures. Flanges shall conform to ASTM A182 in accordance with ANSI B16.5. Bolts and nuts shall conform to ANSI B18.2. Bolt studs and studs shall be of the same quality as machine bolts. All bolting and nuts shall be of Type 316 stainless steel ASTM A193, grade B&M hexhead bolts and ASTM 194 grade 8M hexhead nuts.

(2) Victaulic type couplings and fittings may be used in lieu of flanged joints. Pipes shall be radius grooved as specified for use with the Victaulic couplings. Grooved couplings for aeration shall utilize Grade L silicone gaskets rated to 350 degrees Fahrenheit.

(3) Where plain end pipe is joined by sleeve couplings, these shall be welded-on type 316L stainless steel attachments for joint restraint at all couplings except where tie rods may run from adjacent flanges. Furnish at least two tie rods at all restrained joints. Sleeve-type couplings shall be as manufactured by Dresser Manufacturing Division of Dresser Industries; Smith-Blair, Inc.; R.H. Baker & Co., Inc. equal. Couplings shall be manufactured of Type 316L stainless steel. All couplings shall be furnished with pipe stop removed. Gaskets shall be fluoroelastomer (FKM / Viton) and shall conform with AWWA C111/ANSI A21.11. Couplings shall allow at least 2 degrees angular deflection and at least 3/8 in relative axial motion of adjoining pipe sections. Flange adaptors shall join plain end pipe to flanged with 150 lb or 300 lb flange and shall be equal to Dresser Style 128 and of 316L stainless steel material. Joint restraint shall be provided at all flange adaptors. Flange adaptor couplings may be substituted for flanged joints wherever space permits.

e. Furnish tapped bosses on the pipe locations as may be required by the equipment manufacturer and engineer for the purposes of connecting small tubing and instruments to the pipe. Tapped bosses shall be of the same material as the pipe, welded to the pipe wall and shall have NPT threaded connections.

f. Furnish welded-on tabs or angle ring on pipe wherever vertical pipe is to be supported by a riser clamp, to support the weight of the pipe.

9. Pipe and fittings for the sampling service shall be Schedule 40, socket weld austenitic Type 316L stainless steel pipe conforming to ASTM A312 and ANSI B36.19. Hydrogen peroxide feed tubing shall be at a minimum thickness of 0.035 inches, socket weld 304 stainless steel. Pipe shall be fabricated true to dimension and round. Ends of pipe shall be perpendicular to the longitudinal axis. Pipe shall be straight within maximum 1/8-in deviation over 10 feet. All pieces shall be marked with schedule and type of stainless steel. Fittings to valves, specials, and instrumentation shall be flanged type with fluoroelastomer (FKM / Viton) gaskets and PTFE gaskets servicing the hydrogen peroxide service. Fittings shall be as manufactured by Swagelock or equal.

10. Where connecting pipe joints of different materials, a flange, isolation kit shall be used. The retainer shall consist of G-10 material, seal shall be nitrile, sleeve shall be mylar, and washer shall be G-10 material.

11. Schedule STD pipe shall be used on all roll grooved coupling joints.

B. Field welding:

1. Welding in the field will not be allowed except under special circumstances and shall be done only if approved by the Purchaser. If field welding is approved, field welds shall be made by welders certified under ASME Section IX and be equal in all respects to shop welds. After field welding has been done, all joints shall be thoroughly pickled, passivated, cleaned, and buffed.

2.05 PVC PIPE:

A. Materials:
   1. Materials shall conform to AWWA C900.
   2. Gaskets shall conform to ASTM F477 and be synthetic rubber.
B. Design of Pipe: Design shall conform to AWWA.
C. Dimensions: The minimum pressure class for PVC pipe shall be DR-18.
D. Diameters: PVC pressure pipe shall have Cast-Iron-Pipe-Equivalent (CI) outside diameters.
E. Joints: Pipe shall be furnished with integral bell-type pipe ends designed for joint assembly using elastomeric gaskets.
F. Fittings:
   1. Fittings shall conform to AWWA C110 or C153 and be ductile iron. Fittings shall be mechanical joint or push-on-type joint.
   2. Fittings for 4-inch through 8-inch pipe shall be injection-molded PVC with push-on-type joint, Class 150, conforming to AWWA C907.
G. Marking: Identification markings on pipe shall conform to AWWA C900.

2.06 COPPER PIPE:

A. Pipe used in service line construction (two (2) inch in diameter or less) shall be copper, and shall conform to the following specifications:
   1. Copper Service Pipe shall be Type K soft, conforming to Federal Specification WW-T-799 or ASST, B88-62.
   2. The service line shall be a continuous piece (no splices) from the corporation stop to the curb stop, or as otherwise approved by the Owner and/or Engineer.

2.07 SLEEVES AND COUPLINGS:

A. Sleeves:
   1. AWWA C110 mechanical joint ductile iron solid sleeve type:
      a. Pipe end space shall not exceed one-third of the sleeve laying length.
      b. Interior, exposed, exterior, or buried service as indicated.
B. Couplings:
   1. Center sleeve and compression gland-type end ring conforming to AWWA C219.
   2. Center sleeve shall be without pipe stop.
   3. Couplings for joining concrete or steel pipe shall be steel.
   4. Couplings for joining direct buried, exposed exterior, vault or pit installations of iron, or PVC pipe up to 12-inch diameter shall be iron. Provide lined and coated steel couplings for larger pipe diameters.
   5. Couplings for exposed interior iron or PVC pipe may be steel or iron.
   6. Fastener bolts shall be ductile iron or stainless steel for iron couplings and high-strength, low-alloy steel for steel couplings. Bolts for direct buried coupling installations shall be stainless steel.
   7. Center sleeve and end rings shall be:
      a. Ductile or malleable iron for iron couplings.
      b. Steel for steel couplings.

8. Lining and Exterior Coating:
    a. Use for all steel couplings intended for direct bury, exposed exterior, vault or pit installations.
    b. Completely coat center sleeve and end rings.
    c. Two-part epoxy or nylon fuse-coated to a minimum 10 mils thickness.
    d. Line interior of all steel couplings intended for exposed-interior installations. Coat exterior with normal shop coating.

C. Flanged Coupling Adapters:
1. Flanged end and body to be one unit conforming to AWWA C219. Coupling end to be compression gland type with follower ring.
2. Adapters for joining direct buried, exposed exterior, vault or pit installations of iron pipe shall be iron.
3. Adapters for joining exposed interior iron pipe may be steel or iron.
4. Flanged end bolt circle, bolt size, and spacing shall conform to the applicable provisions of ANSI B16.1 and shall be drilled Class 125 for iron adapters. Flanges on steel adapters shall be AWWA C207, Class D, drilled ANSI B16.1 Class 125.
5. Bolts and nuts shall be ductile iron for iron adapters and high-strength, low-alloy steel for steel adapters.
6. Anchor studs shall not be used where joint restraint is required. Furnish adapters with tie rod harness assemblies where indicated.
7. Lining and Exterior Coating for Steel Adapters:
    a. Two-part epoxy or nylon fuse-coated to a minimum 10 mils thickness.
    b. Completely coat adapter sleeve and end follower gland plus line interior for adapters intended for exposed exterior, vault or pit installations.
    c. Line interior of all adapters intended for exposed interior installations. Coat exterior with normal shop coating.
8. Grooved flange adapters shall be used in lieu of flanged coupling adapters when the piping system is grooved.

D. Expansion Joint Couplings:
1. Furnish single-end and double-end steel pipe expansion joints where indicated.
2. Slip-pipe's exterior section, which is in contact with the packing, is to be hard chrome-plated on a machined surface.
3. Furnish with limit rods where joint restraint is required.
4. Lining and Exterior Coating:
    a. Normal shop coating.
    b. Line slip-pipe with epoxy.
    c. Line body-pipe with epoxy.
5. Bolts and limit rods shall be stainless steel.
6. Acceptable manufacturers are as follows:
    a. Dresser Industries, Inc. - Type 1, 2, 3, and, Style 63.
    b. Victaulic Style 231S Expansion Coupling.
    c. Rockwell International Corp. – Type 611 and 612.
    d. Ford Style FEJ, Ford Meter Box Company, Inc.
    e. Engineer approved equal.

E. Anchored Couplings:
1. Furnish where joint restraint required to offset internal pipeline forces.
2. Provide harnessed sleeve couplings and flanged coupling adapters with tie rod harnesses where indicated.

a. Harnesses shall consist of lugs or clamps welded or otherwise securely fastened to opposite joint elements with tie bolts between opposing lugs. "Dog ear" lugs shall be fabricated as indicated.
b. Design of harnesses for steel pipe shall conform with applicable provisions of AWWA M11.

3. Provide expansion couplings with limit rods.
4. Provide couplings for grooved and shouldered type joints conforming to AWWA C606.
   a. Furnish cut grooved ends on ductile iron end pipe.
   b. Furnish roll grooved ends on steel pipe.
5. Mechanical joint retainer glands shall not be used where joint restraint is required unless indicated. When indicated, retainer glands shall be Megalug manufactured by EBAA Iron, Inc.

F. Insulated Couplings:
1. Couplings shall be insulated to prevent electrical conductivity where indicated.
2. Insulated coupling design shall be otherwise conforming to the standard types and styles specified.

G. Dismantling Joint:
1. Consists of a mechanical joint fitting located between two pipe flanges with restraining rods across the mechanical joint section, providing a restrained system with integral space for removal of adjacent equipment.
2. Shall conform to AWWA C219.
3. Materials shall be steel.
4. When connected to ductile iron pipe system, install insulating flange kit.
5. Grooved couplings may be used in lieu of traditional dismantling joints.

2.08 COMPRESSION FITTINGS:

A. Acceptable Manufacturers:
1. A.Y. McDonald 74758-22.
2. Mueller H-15403N.
3. Engineer Approved Equal.

2.09 GASKETS AND BOLTING MATERIALS:

A. Provide all gaskets, bolts, lubricant, and other accessories required to install pipe, fittings, and specials complete and ready for service.

B. Gaskets for flanged joints shall conform to ANSI B16.21, 1/8-inch thick full-face elastomer or American Cast Iron Pipe Company Toruseal 1/8-inch thick full-face gasket or U.S. Pipe Company Flange-Type 1/8-inch thick ring gasket. Provide full-face gaskets for all pump and equipment connections.
1. Flanged joints in blower air service shall be provided with Fluoroelastomer gaskets.

C. Gaskets for ductile iron flanged pipe and fittings 12 inch and smaller shall have "nominal" inside diameters, not the larger inside diameters per ANSI B16.21.

D. Bolts for flanged joints shall conform to ASTM A307, Grade B. Nut and bolt heads shall be hexagonal.

E. Gaskets and bolts for other than flanged joints shall be as otherwise specified for pipe and pipe joints.

2.10 TRACER WIRE:

A. Tracer wire shall be provided as indicated.
1. Minimum AWG 10 solid copper

2. 30 mils of green PE insulation

B. Tracer wire tape shall be as follows:
   1. 2-inch-wide vinyl plastic electrical tape
   2. 7 mils in thickness

C. Where connections to existing tracer wire are required or where connections to newly installed tracer wire (tees, end of rolls, etc.) are required, tracer wire shall be spliced with:
   1. DryConn Direct Bury Lug Aqua waterproof connector.
   2. Engineer Approved Equal.

2.11 JOINT BONDING:

A. Joint bonding shall be provided as indicated.

B. Bonding shall be accomplished:
   1. With No. 2 insulated, stranded, soft annealed copper wire attached to pipe cylinder by thermic weld.
   2. With manufacturer's standard subject to Engineer's approval.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Specified in Section 33 31 50 - Pipe Installation.

3.02 FIELD TESTING:

A. Specified in Section 33 31 50 - Pipe Installation.

3.03 TRACER WIRE:

A. Install according to Section 33 31 50 - Pipe Installation.

3.04 FIELD PROTECTIVE COATING:

A. Specified in Section 09 90 00.

END OF SECTION 33 11 00

SECTION 33 12 16 - UTILITY VALVES AND ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes all valves and accessories.

B. Related Work Specified Elsewhere:

1. Section 09 90 00 - Protective Coatings.
2. Section 33 31 50 - Pipe Installation.

1.02 REFERENCES:

1.03 SUBMITTALS:

A. Submit as specified in Division 1.

B. Include, but not limited to, the following:

1. Catalog data or illustrations showing principal dimensions, parts, and materials.
2. Spare parts list referenced to illustration of parts.
3. Assembly and disassembly or repair instructions.
4. Dimensions of the clearance required for butterfly valve discs.

C. Certificates and Affidavits: Furnish prior to shipment. Include the following:

1. Test certificates.
2. Affidavit of compliance with applicable AWWA Standard.

1.04 QUALITY ASSURANCE:

A. Manufacturers shall be experienced in the design and manufacture of specific valves and accessories.

1.05 DELIVERY, STORAGE, AND HANDLING:

A. Deliver, store, and handle equipment and materials as specified in Division 1.

1.06 RESPONSIBILITY:

A. Actuators, their controls, and accessories shall be the responsibility of the valve manufacturer for sizing, assembly, certification, field testing, and any adjustments necessary to operate the valve as specified.

PART 2 - PRODUCTS

2.01 BUTTERFLY VALVES:

A. Acceptable Manufacturers for process related valves (See Table 1 and Table 2 below for process butterfly valves):
   1. DeZURIK/Sartell - Model BAW
   2. Henry Pratt Company
   3. Val-matic

B. Acceptable Manufacturers for utility related valves (See Civil Drawings for utilities valves):
   1. SPX/DeZurik – Style BOS.
   2. Tyco-Keystone – Figure AR2.

C. Design:
   1. Conform to AWWA C504, AWWA C540, and as specified.
   2. Suitable for type of installation specified.
   3. Conform to criteria indicated in Design Data and Valve Schedule.
   4. All valve end flanges shall conform to the following:
      a. ANSI B16.1, Class 125 for cast-iron body, Class 25A through Class 150B valves.
      b. AWWA C207, Class D with ANSI B16.1 Class 125 drilling for steel body, Class 25A through Class 150B valves.
      c. ANSI B16.1, Class 250 for ductile-iron body, Class 250 valves.
      d. AWWA C207, Class E for steel body, Class 250 valves.
   5. Mechanical or push-on type rubber-gasket joint ends shall conform to AWWA C111.
   6. Valves with a stop or lug cast integrally or mechanically secured to the body for the purpose of limiting disc travel will not be acceptable.

D. Design Data: Refer to Drawings for Valve Schedule.

E. Materials and Construction:
   1. Body shall be of cast iron for Class 25A through Class 150B valves and ductile iron for Class 250 valves or fabricated steel, as indicated in the Valve Schedule.
   2. Shafts shall be ASTM A276 Type 304 or 316 stainless steel for Class 25A through Class 150B valves and ASTM 564 Type 630 stainless steel for Class 250 valves. Design velocity for Class 250 valves shall be 16 fps.
   3. Disc shall be cast or ductile iron for Class 25A through Class 150B valves and ductile iron for Class 250 valves or steel for fabricated steel valves.
   4. Seats shall be synthetic rubber and be body mounted. Provide field replaceable and adjustable seat accessible from down-pressure side of valve for sizes 30-inch and larger. Mating seat surface shall be stainless steel or Monel. Sprayed or plated mating surfaces are not acceptable.

5. Shaft seals shall be designed for use of standard self-adjusting split-V-type packing or standard O-ring seals. Pull-down packing is not acceptable.

F. Actuators:
   1. Manual Actuators:
      a. All valves shall open counterclockwise.
      b. Provide indicators to show position of disc except on buried actuators. Provide handwheels with raised cast arrow and word OPEN on rim oriented to specified opening direction.
      c. Actuators shall be oil or grease-lubricated, totally-enclosed compound lever, traveling nut type to provide characterized closure. Actuator shall be self-locking at all variable opening positions.
      d. Travel limiting stop nuts or collars installed in the actuating mechanisms shall be field adjustable and shall be locked in position by means of a removable roll pin, cotter pin, or other positive locking device. Clamps or setscrews are not acceptable.
      e. Actuators and handwheels shall be located in positions indicated or as otherwise determined when manufacturer's drawings are submitted.
      f. Furnish actuators with AWWA operating nuts for all buried installations unless otherwise scheduled.
      g. Exposed buried actuator case, supports, and connection to the valve shall be cast iron.
      h. Exposed, buried service actuator shafting, bolts, and fastening hardware shall be stainless steel.
      i. Hand chains shall be cadmium plated or stainless steel.
   2. Motor Actuators:
      a. Provide electric motor actuators as specified in sub-section 2.12 ELECTRIC MOTOR ACTUATORS herein.

G. Valve Controls:
   1. Operate valve actuator to perform control function required.
      a. Open or close valve.
      b. Modulating.
   2. Include all pilot valves, needle valves, strainers, interconnecting piping, fittings, positioners, solenoid valves, limit switches, and other accessories essential to valve function factory-assembled on valve body or actuator.
      a. Small control valves shall be bronze or brass; and piping shall be copper.
      b. Provide solenoid valves, limit switches, positioners, and other accessories as required for proper operation.
   3. Equip actuators with heavy-duty, screw type terminal strip assemblies, designed to accept ring-tongue terminals for minimum size number 14 AWG wire.

H. Testing: Furnish certified copies of results of performance, leakage, and hydrostatic tests performed in compliance with Section 5, AWWA C504.

I. Shop Painting: Paint exterior surface of valves in compliance with AWWA C504 for installation as noted. Apply interior coating conforming to AWWA C550 to exposed ferrous metal surfaces. Provide affidavit or certificate of compliance per AWWA C550.

2.02 ECCENTRIC PLUG VALVES:

A. Acceptable Manufacturers:
   1. DeZurik
   2. Nordstrom
   3. Walworth
   4. Henry Pratt Company

B. Design:
   1. Quarter-turn nonlubricated eccentric type with resilient faced plug. Valves with vane type seat rings are not acceptable. Shutoff up to scheduled rating with pressure in reverse direction where scheduled.
   2. Conform to criteria indicated in Valve Schedule table.
   3. Flanged valve ends shall be faced and drilled to conform to ANSI B16.1, Class 125 for thickness and drilling.
   4. Mechanical or push-on type rubber-gasketed joint ends shall conform to AWWA C111.
   5. Port areas for valves through 500 mm 20-inch shall be at least 80% of full pipe area. Port areas of 24-inch and larger valves shall be at least 70% of full pipe area.
      a. Valves specified as “Full Port”: Bodies shall be Cast Iron ASTM A126 Class B. Ports shall be rectangular and 100% Port Area. The valve port area shall meet or exceed standard pipe area per ASME/ANSI B36.10M.
   6. Plugs shall be eccentric type with no backing ring or frame.
   7. Valve body cavity shall be smooth without protrusions or baffles.
   8. Design velocity for valves shall be 12 fps.

C. Materials and Construction:
   1. Bodies shall be of ASTM A126, Class B cast iron.
   2. Valve plug shall be ASTM A126, Class B cast iron or ASTM A536 ductile iron. Resilient plug facing or replaceable style body seats shall be synthetic rubber, neoprene, or Buna N compound suitable for use with water and wastewater applications.
   3. Seat rings shall be threaded or welded of corrosion-resistant 18-8 stainless steel, nickel, or Monel conforming to AWWA C504. Sprayed or plated mating seat surfaces are not acceptable.
   4. Bearings shall be replaceable. Sleeve type and thrust bearings in the upper and lower journals shall be corrosion-resistant stainless steel or bronze.
   5. Shaft seals shall be multiple O-ring, self-adjusting U-cup or chevron type packing conforming to AWWA C504. Pull-down packing is not acceptable.
   6. Shaft seals shall be field adjustable or replaceable without valve disassembly.
   7. All exposed fastening hardware shall be zinc plated or stainless steel. Provide stainless steel for buried service.

D. Actuators:
   1. Manual Actuators:
      a. All valves shall open counterclockwise.
      b. Provide indicators to show position of plug except on buried actuators.
      c. Nut operators shall be AWWA 2-inch size for operation by valve key, wrench head lever, or a chain lever. Furnish one lever for each valve.
      d. Hand chains shall be cadmium plated or stainless steel.
      e. Worm gear actuators shall be totally enclosed, grease sealed, gear type furnished with AWWA nut, crank, handwheel, or chainwheel. All buried valves shall be provided with worm gear actuators, AWWA nut, and enclosed cover plate. All

valves with reverse pressure capacity requirement shall be provided with worm gear actuators. Worm gear actuators shall be self-locking at all variable opening positions and sized to meet the torque ratings of AWWA C504. The shaft in a worm gear actuator shall have a nonmetallic or bronze sleeve type bearing. Submit manufacturer's parts and materials drawings.

f. Handwheels shall be located in positions indicated or as otherwise determined when manufacturer's drawings are submitted.

2. Motor Actuators:
   a. Provide electric motor actuators as specified in sub-section 2.12 ELECTRIC MOTOR ACTUATORS herein.

E. Valve Controls:
1. Operate valve actuator to perform control function required.
   a. Open or close valve.
   b. Modulating.
2. Include all pilot valves, needle valves, strainers, interconnecting piping, fittings, positioners, solenoid valves, limit switches, and other accessories essential to valve function factory-assembled on valve body or operator.
   a. Small control valves shall be bronze or brass; piping shall be copper.
   b. Provide solenoid valves, limit switches, positioners, and other accessories as required for proper operation.
3. Equip actuators with heavy-duty, screw type terminal strip assemblies, designed to accept ring tongue terminals for minimum size number 14 AWG wire.

F. Testing: Furnish certified copies of results of tests prior to shipment. All valves shall be subjected to an AWWA C504 procedure cycle life and pressure leak test at 150 psi and a body hydrostatic test at 300 psi. Valves shall be capable of providing drip-tight shutoff up to the full leak test rating. Certify reverse pressure capacity.

G. Shop Painting: Apply interior coating conforming to AWWA C550 to exposed ferrous metal surfaces. Provide affidavit or certificate of compliance per AWWA C550.

H. Valve Schedule:

2.03 STANDARD SWING CHECK VALVES:

A. Acceptable Manufacturers less than 4-inches in diameter:
   1. Crane Valve Company - Model: Number 36
   2. Lunkenheimer Company - Model: Figure 554Y

B. Acceptable Manufacturers 4-inches and greater in diameter:
   1. Kennedy Valve Company – Model: 159
   2. M&H – Model 159
   3. Mueller Company – Model A-2600
   4. Apco Willamette Valve and Primer Corporation – Model 250

C. Design:
   1. Conform to AWWA C508 and as specified.
   2. Iron body, bronze mounted, full opening.
   3. Extended stainless steel hinge pin with outside lever and weight.
   4. Design velocity shall be 12 fps.

D. Materials and Construction:
   1. Body and cover shall be cast iron. Flanges shall be ANSI B16.1, Class 125.
   2. Valve disc shall be bronze faced cast iron.
   3. Rubber faced discs or disc rings shall be Buna N for liquid applications and Viton for compressed air applications.
   4. Suitable for listed operating pressure.

E. Valve Schedule:

2.04 BALL VALVES:

A. Acceptable Manufacturers for Ball Valves less than 6-inches in diameter:
   1. Conbraco Industries, Inc. – Apollo Valves.
   2. Metso Automation/Jamesbury.
   3. NIBCO, Inc.
   4. Flow-Tek, Inc.

B. Operational Requirements:
   1. Suitable for isolation service.
   2. Operation of the valve will be continuous.
   3. Operational pressures will be as follows:
      a. Normal system range 0 to 200 psi.

C. Design: Conform to AWWA C507, AWWA C540 and as specified.
   1. Valves shall consist of essentially three main parts:
      a. Body with full unrestricted circular inlet and outlet with diameter equal to rated size of valve.
      b. A moveable plug having a full, unobstructed circular waterway opening equal to valve body opening.
      c. A totally-enclosed operating mechanism mounted on and attached to valve body.
   2. Seats shall consist of flexible metal on the ball or resilient rubber on the body and rigid stainless steel seats opposite and located on both ends of valve.
   3. Shaft seals shall be self-adjusting split-V-type or rubber O-ring type designed for replacement under line pressure.
   4. Valve body shall have flanged ends. Flanges shall be ANSI B16.1, Class 125.

D. Materials and Construction:
   1. Valve body and plug shall match or be compatible with pipe material.
   2. Valve shall be furnished complete with operating mechanism and accessories suitable for accomplishing specified operations.

E. Valve Operating Mechanism:
   1. Valve shall be equipped with a traveling cross-head type operator and shall operate plug by means of a cross-head linked to a rotator lever.
   2. Rotator lever shall impart rotary motion to plug shaft.
   3. Provide an indicator to show position of plug with respect to body opening.

F. Actuators:
   1. Manual Actuators:
      a. Valve shall open counterclockwise.
      b. Provide non-rising stem mechanism self-locking in all positions.

G. Testing: Furnish certified copies of results of tests performed in compliance with Section 13, AWWA C507.

H. Valve Schedule: Refer to Drawings for Valve Schedule.

I. Shop Painting: Apply interior epoxy coating conforming to AWWA C550 and NSF to exposed ferrous metal surfaces. Provide affidavit or certificate of compliance per AWWA C550 and NSF.

J. Valve Schedule:

VALVE TAG	SIZE (IN)	OPERATING PRESSURE (PSI)	LOCATION	INSTALLATION	VALVE ENDS	ACTUATOR			MEDIA	SYSTEM PIPE

2.05 PINCH VALVES:

A. Acceptable Manufacturers:
   1. Onyx Valve Company.
   2. Red Valve Company.
   3. RF Valves.

B. Design:
   1. Valves shall be full cast metal body mechanical pinch type with integral flanges on body and flexible sleeve.
   2. All internal metal parts are to be isolated from the process fluid by the flexible rubber sleeve.

C. Materials and Construction:
   1. Valve body shall be ductile iron, stem and pinch bar shall be stainless steel, and sleeve shall be rubber.
   2. Suitable for 150 psi operating pressure.
   3. Valve body shall have flanged ends. Flanges shall be ANSI B16.1, Class 125.

D. Valve Operating Mechanism:
   1. The steel mechanism shall be double acting with pinching of the sleeve trim occurring equally from two sides.
   2. Rotating the handle counterclockwise shall lower a pinch bar above the sleeve, while raising a pinch bar below the sleeve, pinching the sleeve closed at the center of the valve.

E. Actuators:
   1. Manual Actuators:
      a. Valve shall open counterclockwise.
      b. Provide non-rising stem mechanism.
   2. Motor Actuators:
      a. Provide electric motor actuators as specified in sub-section 2.12 ELECTRIC MOTOR ACTUATORS herein.

F. Testing: Furnish certified copies of results of tests prior to shipment.

G. Valve List:

Parameter	**GRSC-VLV-312**	**GRSC-VLV-314**

PID	Y302	Y302
Installation	Headworks Building Interior Above Grade	Headworks Building Interior Above Grade

2.06 PRESSURE REDUCING VALVES:

A. Provided as indicated on Contract Drawings.

B. Acceptable Manufacturers less than 3-inches in diameter:
   1. Watts Automatic Control Valve Company – Model 500 Series LF223
   2. Wilkins – Model 500 Series
   3. Engineer-approved equal.

C. Acceptable Manufacturers 3-inches and larger in diameter:
   1. Watts Automatic Control Valve Company – Model ACV Series 115
   2. Cla-Val Company – Model 90-01
   3. Engineer-approved equal.

D. Design:
   1. Valves shall be of flanged globe body type.
   2. Inlet flange shall be ANSI B16.1, Class 125. Outlet flange shall be ANSI B16.1, Class 125.
   3. Suitable for operation as follows:
      a. Maximum flow rate condition: 215 GPM.
      b. Normal system inlet pressure: 75 psi to 135 psi.
      c. Regulate downstream pressure at Headworks: 85 psi.
      d. Regulate downstream pressure at Solids Handling Building: 85 psi.
   4. Such that internal main valve assembly can be dismantled without removing valve body from pipeline.

E. Materials and Construction:
   1. Body shall be cast iron, ductile iron, or stainless steel.
   2. Trim shall be bronze or stainless steel.
   3. Seats shall be leather or other resilient material and shall be replaceable.

F. Operational Requirements:
   1. Suitable for pressure-reducing service.
   2. Operation of the valve will be frequent.
   3. Cushioned to permit operation without causing shock or water hammer.
   4. Operate without continuous waste of water.
   5. Provide tight closure when shut and full pipeline opening when open.
   6. The valve shall maintain accurate control of the downstream pressure regardless of fluctuation in flow or upstream pressure.
   7. Adjustable for speed of open and close operation and control pressure.

G. Valve Controls:
   1. Control Function:
      a. Pressure regulation - maintain preadjusted downstream pressure for varying rates of flow and upstream pressure.
      b. Open and close according to downstream pressure transmitter indication.
   2. Include all pilot valves, needle valves, strainers, interconnecting piping, fittings, cylinders, positioners, solenoid valves, limit switches, and other accessories essential to valve function factory assembled on valve body.
      a. Pilot shall be self-cleaning and self-flushing by locating the outlet in the bottom of the pilot ninety degrees to the inlet
      b. Small control valves shall be bronze or brass; pilot tubing shall be stainless steel braided with Teflon lining. Copper/brass fittings and pilot.

2.07 PRESSURE SAFETY VALVES:

A. Provided as indicated on Contract Drawings.

B. Acceptable Manufacturers:
   1. Watts Automatic Control Valve Company – Model ACV Series 116
   2. Cla-Val Company - Model 50-01
   3. Engineer-approved equal.

C. Design:
   1. Valves shall be of flanged globe body pattern.
   2. Inlet and outlet flanges shall be 6-inch ASME B16.1 Class 125.
   1. Valves shall be external pilot actuated with spring to adjust pressure setting.
   2. Provide indicator rod to show position of opening of the piston or diaphragm.
   3. Suitable for operation as follows:
      a. Pump shutoff head 360-460 feet (155-200 psi).
      b. Normal system operating pressure 75 psi to 150 psi.
      c. Open at 160 psi.
   4. Such that internal main valve assembly can be dismantled without removing valve body from pipeline.
   5. Provide shutoff cocks and Y-strainers on control tubing.
   6. Valve shall have a protective fusion bonded epoxy coating internally and externally. The coating shall conform to AWWA C116.

B. Materials and Construction:
   1. Body shall be cast iron, ductile iron, or stainless steel.
   2. Trim shall be bronze or stainless steel.
   3. Seats shall be EPDM rubber and shall be replaceable.

D. Operational Requirements:
   1. Suitable for pressure-reducing service.
   2. Operation of the valve will be intermittent.
   3. Cushioned to permit operation without causing shock or water hammer.
   4. Operate without continuous waste of water.
   5. Provide tight closure when shut and full pipeline opening when open.
   6. Adjustable for speed of open and close operation and control pressure.

E. Valve Controls:
   1. Control Function:
      a. Open when line pressure exceeds preset value.
   2. Include all pilot valves, needle valves, strainers, interconnecting piping, fittings, cylinders, positioners, solenoid valves, limit switches, and other accessories essential to valve function factory assembled on valve body.
      a. Small control valves shall be bronze or brass; piping shall be copper.
      b. Provide orifice plate assembly for flow control function.

2.08 TELESCOPING VALVES:

A. Telescoping Valves shall be specified herein and have the characteristics and dimensions as shown in the drawings

B. Acceptable Manufactures
   1. Watermann Valves
   2. Whipps, Inc
   3. Troy Valve

C. Design

1. The valve shall utilize a low friction seal to mount to engage the slip tube and mount to the flange of the receiving pipe.
2. All welds shall be performed by welders with AWS certification.
3. Finish: Mill finish on stainless steel. Welds shall be sandblasted to remove weld burn and scale.

D. Slip Tube and Bail
1. The slip tube shall be constructed of Schedule 10 minimum thickness stainless steel pipe. The the overflow end slip tube shall be fitted with a V-notch weir and shall be Schedule 10 stainless steel.
2. The bail shall be constructed of stainless steel and shall be bolted to the stem and welded to the slip tube. The bail style shall be comptible for v-notch weir slipe tube.
3. The maximum travel distance of the slip tube shall be 48 inches. The maximum depth of slip tube shall extend more than 12 inches past the center line of the receiving flange into the recieving pipe at a travel distance of 0 inches.
4. Slip tubes shall be equipped with a grease fitting to allow the operator to apply grease to the slip tube from the operator level.

E. Seal Flange
1. The telescoping valve shall be provided with a self-adjusting seal system to restrict leakage between the slip tube and the receiving pipe.
2. If a neoprene seal and separate companion flange is provided, the neoprene seal shall have a minimum thickness of 1/4-inch and the companion flange shall be stainless steel and shall have a minimum thickness of 3/8-inch.
3. The slipe tube gasket shall be replaceable without the rmeoval of the slip tube assmbly from the reciver pipe, or actuator.
4. The companion flange shall be provided with a bolt pattern suitable for attachment to the flange on the receiving pipe.

F. Stem
1. A threaded operating stem shall be utilized to connect the operating mechanism to the bail which in turn is attached to the slip tube. The threaded portion of the rising stem valves shall engage the operating nut in the manual operator and shall provide autmoatic self-locking, infinite valve positioning.
2. The threaded portion of the stem shall have a minimum outside diameter of 1-1/2 inches. Stem extension pipes are not acceptable.
3. The stem shall be constructed of solid stainless steel bar for the entire length, the metal having a tensile strength of not less than 75,000 psi.
4. Maximum L/R ratio for the unsupported part of the stem shall not exceed 200.
5. In compression, the stem shall be designed for a critical buckling load caused by a 40 lb effort on the handwheel with a safety factor of 2, using the Euler column formula.
6. The stem shall be designed to withstand the tension load caused by the application of a 40 lb effort on the handwheel without exceeding 1/5 of the ultimate tensile strength of the stem material.
7. The threaded portion of the stem shall have machine rolled double lead threads of the full Acme type with a 16 microinch finish or better. Stub threads are not acceptable.
8. Stems shall be provided with adjustable stop collars to prevent over travel.

G. Stem Guides
1. Stem guide shall be provided when necessary to ensure that the maximum L/R ratio for the unsupported part of the stem is 200 or less.
2. Stem guide brackets shall be fabricated of stainless steel and shall be outfitted with UHMW or bronze bushings.

3. Adjustable in two directions.

H. Anchor Bolts
1. Anchor bolts shall be provided by the valve manufacturer for mounting the pedestal and appurtenances.
2. Quantity and location shall be determined by the valve manufacturer.

I. Materials of Construction
1. Slip tube and bail shall be stainless steel, Type 304L
2. Stem shall be stainless steel, Type 304L
3. Anchor Studs, Fasteners and Nuts shall be stainless steel, Type 316
4. Seal shall be Urethane, Neoprene or Buna-N
5. Lift Nuts shall be stainless stainless steel, Type 304.
6. Pedestals and wall bracks shall be stainless steel, Type 304L
7. Operator Housing shall be cast aluminum
8. Stem cover shall be a clear plastic Butyrate
9. Companion flange shall be cast iron

J. Valve Operator
1. Valves shall be operated by a manual handwheel. The operator shall be mounted on a pedestal
2. The valve manufacturer shall select the proper gear ratio to ensure that the valve can be operated with no more than a 40 lb effort.
3. An arrow with the word "OPEN" shall be permanently attached or cast onto the operator to indicate the direction or rotation to open the valve
4. Handwheel operators shall be fully enclosed and shall have a cast aluminum housing.
5. The handwheel shall be removable. Pedestals shall be constructed of stainless steel. Aluminum pedestals are not acceptable.
6. The pedestal height shall be such that the handwheel is located approximately 36-in above the top of the tank walls.
7. Operators shall be equipped with fracture-resistant clear butyrate.
   a. The top of the stem cover shall be closed.
   b. The bottom end of the stem cover shall be mounted in a housing or adapter for easy field mounting.
   c. Stem covers shall be complete with a mylar strip type position indicator, calibrated in ¼ inch increments to illustrate valve position. The mylar strip, provided by the manufacturer, will be affixed by the CONTRACTOR after installation to provide a true and accurate indication of the tube elevation by comparing it to the top of the rising stem.
8. Valve Schedule:

Parameter	**WAS-VLV-001**	**WAS-VLV-002**
Size, (in)	6”	6”
Max T (deg F)	100	100
Media	Thin Sludge Decant	Thin Sludge Decant
Actuator Type	Manual, Handwheel	Manual, Handwheel
System Pipe	DIP Vertical	DIP Vertical
Service	Open/Close	Open/Close
PID	Y401	Y401
Installation	Exterior-Exposed	Exterior-Exposed

2.09 TAPPING SADDLES:

A. Provide tapping saddles for services as indicated on the Contract Drawings.
B. Acceptable Manufacturers:
   1. A.Y. McDonald 73805
   2. Ford S90-xxx-NL
   3. Mueller
      a. H-13000 Series
      b. H-13400 Series
      c. S-13000 Series
   4. Engineer approved equal.

2.10 CORPORATION STOPS:

A. Provide corporation stops for service reactivations as indicated on the Contract Drawings.
B. Acceptable Manufacturers:
   1. A.Y. McDonald 74701
   2. Cambridge Brass 302NL Series
   3. Ford FB-600-x-NL
   4. Mueller B25000N
   5. Engineer approved equal.

2.11 SAMPLE/DRAIN TAPS:

A. Provide sample/drain taps on all suction and discharge pump connections and on all common pump headers after last pump connection to main header.
B. Connecting fittings and pipe shall of the same material as the receiving pipe and rated for 150 psi service.
C. Sample/drain taps shall be 1 inch and connected through corporation stops.
D. Isolation valves shall be provided with all sample/drain taps and shall be Crane bronze ball valves or Engineer-approved equal.

2.12 ELECTRIC MOTOR ACTUATORS:

A. Provide factory-mounted electric motor actuators conforming to AWWA C540 for open-close and modulating service to operate on 480V, 3 phase, 60-hertz, ac supply. Motor and control compartment enclosure shall be totally enclosed rated NEMA 4X.
C. For valves installed in Class 1, Division 1 or Class 1, Division 2 areas, motor and control compartment enclosures shall be explosionproof and listed for the classification of the area. Refer to Contract Drawings' Hazardous Area Classification Site Plan for requirements.
D. Motor shall be AC induction type, TEFC, rated 460V.
E. Duration for actuator to move from fully-open to fully-closed position, or reverse as indicated:
   1. Approximately 30 Seconds for eccentric plug valves.
   2. Approximately 5 seconds per diameter inch, but not less than 20 seconds for air service butterfly valves.
F. Equipped with a direct position readout at the valve by means of a mechanical dial-position indicator showing percent of valve opening.
G. Provide with manual handwheel operator and lockable de-clutch mechanism. Handwheel shall not rotate when electrically driven.
H. Provide the following integral accessories:
   1. Integral reversing motor starter.

2. Separate non-fused disconnects. Disconnects shall be operable from outside the enclosure and shall be integral to the assembly. Disconnect enclosure rating shall conform to the valve enclosure rating.
3. Local/Off/Remote (LOR) selector switch with auxiliary remote status contact.
4. Open/Close pushbuttons to operate actuator when LOR is in "Local".
5. Hard-wired I/O points as indicated on the Contract Drawings' Control Diagrams and Section 40 61 96A - I/O List. Discrete outputs shall be provided by dry contacts, rated minimum 2A at 120Vac.
6. Butterfly valves:
   a. Internal 480V to 24VDC power supply (PS).
      (1) PS shall be sized to operate starter, local indicating lights, internal heating systems, and provide sufficient volt-amperes to field power two digital inputs and two digital outputs to PLC.
7. Eccentric plug valves:
   a. Internal 480V to 120VAC control power transformer (CPT).
      (1) CPT shall be sized to operate starter, local indicating lights, internal heating systems, and provide sufficient volt-amperes to field power two digital inputs and two digital outputs to PLC.
8. Modulating Valves:
   a. Shall accept a 4-20mA input signal for position control.
   b. Shall provide an isolated 4-20mA isolated output signal (with integral power supply) for position indication.
9. Open/Close Valves:
   a. Provide with two indicating lights in limit switch compartment cover.
      (1) One red light indicating valve is fully open.
      (2) One green light indicating valve is fully closed.
      (3) Both lights shall be on while valve is in travel
   b. Provide 4 train mechanically driven limit switches and overtorque switches.
   c. Switches shall be gear driven from the actuator gear train, electronic switches with battery pack shall not be allowed.
10. Internal heater to prevent condensation.

I. Products of the following manufacturers shall be acceptable:
   a. Auma Actuators, Inc.
   b. Limitorque Corporation.
   C. Rotork Controls, Incorporated.

2.13 COMBINATION AIR VALVES:

A. Acceptable Manufacturers:
   1. Multiplex Manufacturing Co. Model: Crispin SA Series.
   2. Valve and Primer Corp., DeZurik/APCO Model: Series 401.

B. Design: Conform to AWWA C512 and as specified.
   1. Valve shall be heavy-duty combination air release, water style.
   2. Body and cover shall be cast or ductile iron.
   3. Float shall be stainless steel.
   4. All internal parts shall be stainless steel.

C. Operation:
   1. Release air when filling line.
   2. Admit air when emptying line.
   3. Release accumulated air while pipeline is full and operating under pressure.

D. Connection:
   1. Connect air valves 2 inches and smaller to pipeline through corporation stops.
   2. Connecting fittings and pipe shall be bronze, brass, or copper rated for 250 psi service.
   3. Isolation valves shall be provided for all air valves and shall be bronze gate valves for sizes 3 inches and smaller unless otherwise noted.
      a. Acceptable Manufacturers:
         (1) Crane Model: Figure 431.
         (2) Jenkins Model: Figure 47.
         (3) Lunkenheimer Co. Model: Figure 2151.
   4. Couplings or unions indicated between pipeline and air valve piping shall be insulated style.

2.14 FIRE HYDRANTS:

A. Acceptable Manufacturers:
   1. American Flow Control.
   2. Mueller Company, model Centurion.
   3. Engineer Approved Equal

B. Design:
   1. Conform to AWWA C502 and as specified.
   2. Provide compression type main valve designed to open against pressure. Valve facings shall be of nontoxic materials suitable for potable water service.
   3. Provide internal main valve seat opening of not less than 5 inches diameter.
   4. Design to open counterclockwise.
   5. Provide dry-type bonnet with lubricant reservoir protected by O- or Quad-ring seals.
   6. Provide mechanical joint bell on shoe.
   7. Furnish for minimum bury depth of 3.5 feet. Include extensions as required for blow-offs.
   8. Furnish with two 2-1/2-inch hose nozzles and one 4-1/2-inch pumper nozzle with NFPA 1963 standard threads. Nozzle caps shall be chained to hydrant.
   9. Provide traffic break-off joint located above and near ground surface designed to minimize accident repairs.

C. Shop Painting:
   1. Shop paint exterior of hydrants red.
   2. Interior Coating:
      a. Conform to AWWA C550.
      b. Apply to exposed interior ferrous metal surfaces.

2.15 CORPORATION STOPS:

A. Provide corporation stops as specified to isolate air valves or as manual air release or inlet valves.

B. Mueller Company Style H-10003, H-10013, or H-10045 or Engineer-approved equal as applicable.

2.16 CURB STOPS:

A. Provide curb stops for service isolation.

B. Acceptable Manufacturers:
   1. A.Y. McDonald 74701.
   2. Cambridge Brass 302NL Series.
   3. Ford FB-600-x-NL.

4. Mueller B25000N.

2.17 VALVE BOXES:

A. Acceptable Manufacturers:
   1. Clay and Bailey Manufacturing Company.
   2. Dresser Industries, Inc.
   3. Mueller Company.
   4. Neenah Foundry Company.
   5. Tyler Company.
   6. Engineer Approved Equal
B. Provide for all buried valves.
C. Design:
   1. Boxes shall consist of a cast-iron cover, lid, and base castings with 6-inch cast-iron pipe shaft.
   2. Provide extension stem to bring operating nut within 2 feet of valve box top.
   3. Drop cover shall be marked for the appropriate system (i.e., "WATER", “SEWER”).

2.18 CURB STOP SERVICE BOXES:

A. Provide curb stops and service boxes for all curb stops installed.
B. Acceptable Manufacturers:
   1. Tyler Union, Star Pipe, Castings – SB94ES, SB95ES.

2.19 VALVE IDENTIFICATION TAGS:

A. Exposed interior or exterior valves: Provide heavy duty, permanent plastic ID tags with valve number printed on tag using indelible ink and contrasting colors. Minimum tag size shall be 2"x3" and minimum letter height shall be 1". Tag shall be easily removable and shall be mounted so as not to interfere with normal valve operations. Valve ID shall be as identified in the valve schedule.
B. Vault or Pit Installed Valves: Provide a cast bronze floor plate to be anchored into the top concrete slab of pit or valve adjacent to the floor box or floor stand. Plate shall be minimum of 4"x3"x 3/16". Valve number shall be engraved in plate with minimum letter height of 1 1/2". Plate shall be anchored into concrete using threaded lugs with split stud anchor or other suitable anchoring device. Valve number shall be as identified in the valve schedule.

2.20 VALVE ACCESSORIES:

A. Post Indicator:

2.21 SHOP PAINTING:

A. Prepare surfaces and paint or coat all valves, fire hydrants, floor stands, valve boxes, corporation stops, and all related accessories standard of the manufacturer unless otherwise specified herein.
B. Paint and coatings shall be suitable for the service intended.
C. Submit type of paint or coating proposed with drawings and data for Engineer approval prior to fabrication.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Comply with provisions of AWWA C600 and as specified.

B. Thoroughly clean and remove all shipping materials prior to setting. Operate all valves from fully opened to totally closed.
C. Install eccentric plug valves in reverse position, flow and pressure against the plug face when closed, in lines with solids or stringy materials. When installed horizontally with shaft in the horizontal, the plug shall rotate open to the top recess of the valve body.
D. Install double-door wafer check valves with hinge pin in the vertical position for horizontal flow applications.
E. Install single-door wafer swing check valves with hinge pin in the horizontal position for horizontal flow applications.
F. Equip with anchorage where indicated.
G. Set fire hydrants with lowest nozzle 18 inches above finished grade. Check and fill stem bonnet lubricant reservoir.

3.02 FIELD TESTING:

A. Perform on piping and valves as specified in Section 33 31 50 - Pipe Installation and for the following:
    1. Gate valves.
    2. Butterfly valves.
    3. Check valves.
    4. Eccentric plug valves.
    5. Ball valves.
    6. Air and air/vacuum valves.
    7. Fire hydrants.

END OF SECTION 33 12 16

SECTION 33 12 41 – VERTICAL TURBINE PUMPS

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the furnishing and installation of three vertical turbine centrifugal water pumps to be operated with variable speed drives (provided by others) with open line shafts, multistage, above surface discharge. These pumps will be installed in a new wet well for the process water system.

B. Related Work Specified Elsewhere:
   1. Protective Coatings: Section 09 90 00.
   2. Common Motor Requirements: Section 46 05 13.
   3. Process Control Panels and Hardware: Section 40 67 01.
   4. Air Vacuum Valves: Section 33 12 16.

1.02 REFERENCES:

A. Applicable Codes and Standards: Design, fabricate, assemble, and test Equipment and Materials so that upon installation in accordance with the manufacturer's recommended procedures for this application, the Equipment will conform to the requirements of the Federal Occupational Safety and Health Standards and the applicable provisions of:
   1. American Bearing Manufacturer's Association (ABMA).
   2. American National Standards Institute (ANSI).
   3. American Society for Testing and Materials (ASTM).
   4. American Water Works Association (AWWA).
   5. American Welding Society (AWS).
   6. Hydraulic Institute Standards (HIS).
   7. Institute of Electrical and Electronic Engineers (IEEE).
   8. National Electrical Manufacturers Association (NEMA).
   9. NSF International:
      a. NSF Standard 372, Drinking Water System Components – Lead Content.

B. Factory Tests and Reports:
   1. Perform tests on each pump in accordance with Hydraulic Institute Standards except as otherwise specified.
   2. Submit results of factory tests.
   3. Perform standard tests on all motors in accordance with IEEE.

1.03 SUBMITTALS:

A. Submit as specified in Division 1.

B. Submit all documentation as specified in Section 46 05 13.

C. Submittals shall include, but not be limited to, the following:
   1. Standard performance curves for each pump furnished. Curves shall cover range from shutoff through the available operating range of the pump and for the following parameters as a function of pump capacity and speed at design temperature.
      a. Total developed head.
      b. Net positive suction head (NPSH3).
      c. Efficiency.
      d. Required brake horsepower.
      e. Minimum recommended submergence.
      f. Allowable and preferred operating ranges.
      g. Provide head-capacity curves for variable speed units at 60, 70, 80, 90, and 100 percent pump design speed, including allowable and preferred operating ranges.

h. Provide level 1 lateral/structural and torsional calculations per ANSI/HI 9.6.8. Verify the system's above and belowground natural frequencies are outside of the pump operating speed range prior to installation.

2. Submit layout, dimensional, and cross-section drawings.
3. Materials of construction.
4. Motor performance data and results of shop test.
5. Manufacturer's standard protective coating system.
6. Nameplate data.
7. Weights:
   a. Total each unit.
   b. Bowl assembly.
   c. Motor.
   d. Column.
   e. Lineshaft.
   f. Coupling.
8. Equipment instruction books.
9. Maximum height required for disassembling each pump.

D. Submit shop test reports and performance data specified in paragraph 1.04A below.

E. Submit complete operation and maintenance manuals for all equipment.

1.04 QUALITY ASSURANCE:

A. Factory Tests and Reports:
1. Include all manufacturer's standard factory tests on Equipment and Material.
2. Factory shall utilize motor for project or equivalent factory motor for all testing.
3. Test all impellers for dynamic balance.
4. Assemble all pumps completely in the shop including motors, couplings, and related items to ensure component fit-up.
5. Conduct "running test," "hydrostatic test of discharge head," and "hydrostatic test of bowl assembly" for each pump in accordance with Hydraulic Institute Standards.
6. Perform all manufacturer's standard tests to determine the performance of the motors.
7. Pumps shall be tested in position as they will be installed in the field with no exceptions. Factory testing may take place without column between discharge head and pump bowls to allow for testing facility restrictions; however, test reports shall take into account the anticipated difference in losses between the test and final configuration.
8. Perform non-witnessed tests for capacity, power requirements, and efficiency, including wire-to-water, at specified rated head, shutoff head, operating head extremes, and at as many other points as necessary for accurate performance curve plotting per HI Standard section 14.6.3.4 to acceptance grade 1U and at full speed. Include hydrostatic test of at least 150% of shutoff head for bowl assembly and discharge head. Refer to HI Standard 14.6 Appendix B for required test duration.
9. Actual tests cover all data called for with the anticipated performance curves.
10. Submit a written test report and graphic representation(s) of the test results. Submit test logs containing raw test data. Test report data collected and provided shall meet the minimums of Hydraulic Institute Standards.
11. The written test reports shall be provided within seven days after completion of the final test. Retesting will be required if written test reports are not received in timeframe indicated or if tests fail requirements.
12. Submit test reports to Engineer.

B. Balance:

1. All rotating parts shall be accurately machined and shall be in as nearly perfect rotational balance as practicable. Balance shall meet the requirements for ISO 1940 Grade G6.3 or superior. Excessive vibration shall be sufficient cause for rejection of the equipment.
2. Pumps will comply with ANSI/HI 9.6.4 standard after installation.

1.05 FACTORY ASSEMBLY:

A. Pump and motor units shall be completely shop assembled and aligned prior to testing.
B. After completion of the specified factory tests, assemblies shall be prepared for shipment with the minimum amount of disassembly, and such that no field disassembly, cleaning, or flushing is required.
C. Any components removed for shipping shall be match-marked prior to removal and shipment.
D. Prepare surfaces and provide paint system standard of the manufacturer and suitable for service intended. Submit paint type and manufacturer's specification for Engineer's approval.

1.06 DELIVERY, STORAGE, AND HANDLING:

A. Manufacturer is responsible for freight to site. Delivery, storage, and handling shall conform to the following requirement:
   1. Ship equipment as completely assembled as is possible.
   2. Tag each item of equipment.
   3. Protect connections with suitable pipe end protection.
   4. Cover flanged openings with ½ inch plywood covers attached with a minimum of four bolts.
   5. Plug or cap screwed connections with standard fittings.
   6. Provide all temporary covers and bracing required for shipment and handling at the project site.
   7. Complete instruction for handling and storage shall be provided prior to shipping of the equipment. All equipment shall have adequate provisions for handling by overhead crane or fork lift truck.

1.07 WARRANTY:

A. The Manufacturer shall warrant that all Equipment shall be free of defects caused by faulty material or workmanship for a minimum period of one (1) year.
B. Multiple warranties for individual components shall not be acceptable.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Flowserve.
B. Goulds Pumps, Inc.
C. Grundfos Peerless.
D. Pentair Fairbanks Nijhuis.

2.02 PUMPS:

A. Operating Conditions:
   1. Liquid to be pumped is treated wastewater effluent.
   2. Three pumps shall be designed for variable speed operation.
   3. Pumping operations shall be continuous.

4. Pumping controls shall be designed to provide manual operation locally at the face of each pump VFD, and both manual and automatic operation remotely from the plant control system.
5. Pumps shall be operated independently and in parallel.
6. Design to conform to the following:

Number Required	Three
Design Capacity (gpm)	195 gpm, each
Turndown Capacity (gpm)	70 gpm, each, at reduced speed
Total Dynamic Head (ft)	341 ft
Minimum Efficiency at Design Point (percent)	72 percent
Maximum Motor Size (BHP)	25 hp
Maximum Motor Speed (rpm)	1800 rpm
Shutoff Head (feet):	
Maximum	460 ft
Minimum	385 ft
Elevations (feet):	
Centerline Discharge Connection El.	859.0~~916.5~~ ft
Pump Station Floor El.	858.0~~915.5~~ ft
Max. Water Surface El.	~~913.0~~855.0 ft
Min. Water Surface El.	~~908.3~~850.0 ft
Wet Well Floor El.	847.0~~904.5~~ ft
Min. Available Submergence	2.5 ft above lip of suction bell
Discharge Connection Size (inches)	4”

7. Head-capacity curves shall be constantly falling from shutoff head.
8. Brake horsepower of motors furnished shall not be exceeded at any point on the head-capacity performance curves.
9. Total height and assembly clearances shall be compatible with operating room and intake structure.

B. Design:
1. General:
   a. Open line shaft type vertical turbine pumps.
   b. Above surface discharge heads.
   c. Multiple stage as required.
   d. Vertical hollow shaft motor.
   e. Easily accessible adjusting assembly shall be provided for vertical adjustment of pump shaft to properly position impellers.
   f. Hydraulically stable both axially and radially at all outputs.
   g. Capable of preventing damage to the pump or driver created by reverse rotation due to water receding in the discharge column or an upthrust condition.
   h. Provide locking plates or lock-tite on all bolts in the pump bowls or other portions of the pumps where the bolts can enter the pump suction if they become loose.
   i. Accurately and carefully finish all pump surfaces in contact with the fluid.
   j. Provide pumps with lifting lugs or eyebolts to lift the entire pump assembly.
2. Discharge Head:
   a. Fabricated steel type.
   b. Aboveground discharge head.
   c. Provide flange discharge connections of 125-pound class, as required, conforming to ANSI B16.1 for all cast-iron heads.

d. Provide flange discharge connections of 150-pound class, flat faced, as required, conforming to ANSI B16.5 for fabricated steel heads.
e. Adequate openings to permit easy access to the shaft coupling.
f. Include all necessary openings:
   (1) For venting, drainage, water or oil lubrication, and other purposes.
   (2) Tapped for standard pipe openings.
   (3) Tap in flange for pressure gauge connection.
g. Design and construct the discharge head to carry the complete pump and motor weight and completely cover the openings in the base plate.

3. Base Plate:
   a. Cast-iron or fabricated steel type.
   b. Designed to give rigid support to the total weight of the pump, motor, column, discharge head, and fittings.
   c. With an opening to permit removal of pump without requiring removal of base plate after grouting.
   d. With machined surfaces of contact between discharge head and base plate.
   e. Supplied with dowels, shims, bolts and all other devices required for proper installation, alignment and anchoring of units.
4. Stuffing Box:
   a. Stuffing box shall be made of cast iron and shall contain a minimum of five rings of graphite packing with bronze bushing or sleeve bearing.
   b. Be accessible through openings in the discharge head or motor stand.
   c. Top shaft shall have renewable shaft sleeve where it interfaces with packing.
5. Provide stuffing box drain connection and connection in base for piping leakage to pump wet well.
6. Bowl Assembly:
   a. Constructed of cast iron free of blow and sand holes, with minimum tensile strength of 30,000 psi.
   b. Provide flanged bowl connections with bolted stage connections.
   c. Bronze or stainless-steel impellers smoothly finished throughout, secured to a stainless-steel impeller shaft using keys, tapered collets, or threaded-type lock collets to prevent loosening in the event of reverse rotation or thermal expansion.
   d. With replaceable bronze bowl and impeller wear rings on impellers. Wear rings shall be of dissimilar materials or have a minimum hardness difference of 50 BHN.
   e. Assembly shall be dynamically balanced to eliminate vibration.
   f. Bronze sleeve bearings lubricated by liquid pumped.
7. Suction Bell:
   a. Cast iron.
   b. Design and size the suction bells to assure proper hydraulic performance under all operating conditions.
   c. Suction case bearings shall be bronze with permanently lubricated water-resistant grease.
8. Line Shaft:
   a. Design and construct the pump line shaft to run without whip or vibration under all operating conditions.
   b. Provide screwed shaft couplings of the same or better material as the line shaft.
   c. Interchangeable sections having lengths not exceeding 10 feet. Provide bearings on a maximum of 10-foot centers.
   d. Provide line shaft bearings of bronze, cutless rubber, or Engineer-approved equal.

9. Discharge Column:
    a. Discharge column pipe shall be steel with flanged connections.
    b. Interchangeable sections having length not exceeding 10 feet.

2.03 PUMP MOTORS:

A. Provide motors and accessories as specified in Section 46 05 13.
B. Rated for 460-volt, 3 phase, 60-hertz operation. Designed for operation with variable frequency drive.
C. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
D. Provide factory installed, maintenance free, circumferential, conductive micro fiber shaft grounding ring to discharge shaft currents to ground.
E. Provide motor with service factor of 1.15.
F. The manufacturer of the pumps is responsible for furnishing the motors, and for matching the motor and the drive, and for coordinating the collection of data and the design effort to limit harmonics.

2.04 MATERIALS:

A. The materials specified below indicate a standard of quality. Substitutions may be made or recommended by manufacturer upon approval of Engineer, if deemed necessary due to the quality of the fluid being pumped, start-up system flushing chemical additives, or other reasons.
    1. Base plate: Carbon steel structural plate or cast iron.
    2. Discharge Head: Fabricated carbon steel.
    3. Support Column: ASTM A53 carbon steel pipe.
    4. Bowl: ASTM A48 Class 30 or superior cast iron.
    5. Bowl Wear Rings: Bronze.
    6. Impellers: ASTM B584 bronze. Manufacturer standard impeller material may be acceptable if approved by Engineer.
    7. Suction Bell: ASTM A48 Class 30 or superior cast iron.
    8. Line Shaft, Pump Shaft, and Coupling: ASTM A276 Type 410 or 416 stainless steel.
    9. Shaft Sleeves: ASTM A276, Type 416 with 350 minimum BHN, or Type 304 or Type 316 stainless steel.
    10. Line Shaft Bearings: Bronze or cutless rubber.
    11. Impeller Wear Rings: Bronze.
    12. Bowl Bearings: Bronze.
    13. Suction Bell Bearing: Bronze.
    14. Bolting: ASTM A276 Type 316 stainless steel.

2.05 ANCHOR BOLT ASSEMBLY:

A. Complete anchor bolt assembly (studs, nuts, washers, etc.) to be designed by the manufacturer. Assembly not provided by the manufacturer. Anchor material shall be 316 SST. Anchor size and embedment shall be clearly shown on the equipment drawings.

2.06 MOUNTING: Contractor to mount as indicated on contract drawings.

2.07 SPARE PARTS:

A. One complete set for one pump of the following spare parts shall be furnished:
    1. Complete set of lineshaft bearings.

2. Complete set of bowl bearings.
3. Complete set of wear rings, if applicable.
4. Shaft sleeve.
5. Gaskets and complete set of packing.
6. Complete set of motor bearings.
7. Lubricants for a complete drain and refill of motor.

B. All parts supplied with the equipment shall be properly labeled for ease of identification and to permit the shortest possible time to repair. Any parts that come from a sub-supplier shall be labeled with that manufacturer's name and part number.

C. Manufacturer shall warrant that all parts shall be available for a minimum of ten years.

2.08 PROTECTIVE COATINGS:

A. Shop Painting:
1. Manufacturer shall prepare surfaces, prime and finish paint all iron and steel surfaces with manufacturer's standard coating system suitable for intended service and in accordance with Section 09 90 00.
2. All stainless-steel surfaces shall not be painted.

B. Field Painting:
1. Contractor shall touch up coatings damaged during shipment and installation.
2. Pump manufacturer shall furnish Contractor with an adequate quantity of touch-up paint.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Refer to "Manufacturers Field Services" in Division 1 for requirements for startup.

B. Perform all installation and finishing requirements as specified in Section 46 05 13.

C. Installation, start-up, and testing of all Equipment and associated construction shall conform to manufacturer's recommendations.

D. Manufacturer's field representative shall meet with Contractor to give guidelines for installation of Equipment.

E. Manufacturer's field representative shall inspect Equipment after the Equipment has been installed and prior to start-up. A written report of the inspection shall be submitted to Owner (with a copy to Engineer).

3.02 FIELD TESTING:

A. As specified in Division 1.

B. Conduct in the presence of Owner and/or Engineer.

C. Equipment Tests:
1. Performed by certified factory representative(s).
2. Check performance of all components as a functioning unit.
3. Verify factory tests as well as possible with facilities available at the Site of installation.
4. Provide for testing calibrated gauges (within 3 months).
5. Field Balance and Vibration Testing:
a. Test in accordance with ANSI/HI 9.6.4 standard.
b. Perform both Static Bump Test and Dynamic Vibration Testing to determine vibration characteristics of the pumps.
(1) Static bump test shall be performed to determine the natural frequencies of the pump.

(a) Vibration measuring device shall be compatible with test being performed.
(b) Perform static test at pump discharge.
1) Mount vibration probe as indicated by ANSI/HI discharge in Y direction as defined in ANSI/HI Figure 9.6.4.3.2.1.
2) Through use of dead blow hammer, strike pump to excite natural frequency of pump.
3) Average results from four tests to determine natural frequency in Y direction.
4) Repeat steps 1 through 3 as specified above in the X direction as defined in ANSI/HI Figure 9.6.4.3.2.1.
(c) Perform static test on top of motor.
1) Mount vibration probe on top of motor in Y direction as defined in ANSI/HI Figure 9.6.4.3.2.1.
2) Through use of dead blow hammer, strike pump to excite natural frequency of pump.
3) Average results from four tests to determine natural frequency in Y direction.
4) Repeat steps 1 through 3 as specified above in the X direction as defined in ANSI/HI Figure 9.6.4.3.2.1.
(d) Perform at other locations as determined by manufacturer.

(2) Dynamic Vibration Testing shall be performed as follows:
(a) Manufacturer shall define the minimum operating speed/flow for safe pump operation and shall coordinate with the contractor in the field to determine the resultant VFD frquency setting that results in this condition with one pump operating as installed.
(b) Dynamic vibration tests shall be taken at the following points:
1) At the frequency representing the maximum operating speed (100%) of the pump and motor.
2) At 6 Hz step downs in VFD frequency until the minimum operating frequency as determined above in the field is reached. Regions with reonsance concerns should have readings in 1 Hz increments.
3) At the vane pass frequency, if not covered during the frequency step-down testing.

(3) If vibration is outside of acceptable limits as defined by ANSI/HI 9.6.4, submit recommendations for additional testing and/or pump modifications in test report.
(a) Report shall contain the following, at a minimum:
1) Determine speed (frequency) avoidance bands that pump should not operate due to excessive vibration.
2) Provide recommendations for structural modification to pump that would allow the pump to operate at all speeds without speed avoidance bands.

D. Operational Tests:
1. Conduct such operational tests as necessary to determine that the performance of equipment and controls is as specified.
2. Tests will generally consist of placing Equipment in operation under varying conditions and observing performance.

3. Test reports will include flowrate, speed, current draw, pump discharge pressure, and sump water level under varying conditions from 50% (or minimum flowing speed based on field conditions) to 100% speed, at minimum 10% intervals.

E. Provide Field Quality Control as specified in Section 46 05 13.
F. Make all necessary Equipment adjustments and corrective work indicated by tests.
G. Submit a written test report to Owner (with one copy to Engineer) in a letter form showing operations performed and results obtained for each unit.

3.03 MANUFACTURER TRAINING: As specified in Division 1 and as follows:

A. The on-site services provided by the factory-trained representative shall include training.
B. The representative shall provide two complete training sessions to the Owner operating personnel in equipment operation and maintenance. Sessions shall be a minimum of two hours in length, or as required to complete the entire training.
C. One of the sessions shall be recorded, placed on a USB drive, and transmitted to Owner for use in training future personnel.

3.04 INSPECTION:

A. Recheck all units for alignment after Equipment has been placed in operation for approximately 30 days.
B. An inspection of each pumping unit by Equipment manufacturer's representative shall be performed approximately 60 days prior to date of warranty expiration.
   1. Ascertain or appraise the following:
      a. Status of Equipment and installation after normal usage.
      b. Adherence to manufacturer's recommended operation and maintenance of Equipment.
   2. Check the following:
      a. Alignment.
      b. Vibration.
   3. Make adjustments as necessary to restore Equipment within original tolerances.
   4. Submit a written report within 7 days to Owner (with a copy to Engineer) covering all inspection items and including recommendations when applicable.

END OF SECTION 33 12 41

SECTION 33 31 50 - PIPE INSTALLATION

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes handling, installation and testing of pipe, fittings, specials, and appurtenances as indicated or specified.

B. Related Work Specified Elsewhere:
   1. Section 31 20 50 – Site Preparation and Earthwork
   2. Section 31 23 33 – Trenching and Backfilling for Open-Cut Construction
   3. Section 33 11 00 - Pressure Pipe.
   4. Section 33 33 11 - Gravity Piping.

1.02 REFERENCES:

A. Applicable Standards:
   1. ASTM International (ASTM):
      a. D2321 - Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications.
      b. D2774 - Standard Practice for Underground Installation of Thermoplastic Pressure Piping.
      c. F1417 - Standard Practice for Installation Acceptance of Plastic Non-pressure Sewer Lines Using Low-Pressure Air.
   2. American Water Works Association (AWWA):
      a. C105 - Polyethylene Encasement for Ductile Iron Pipe Systems.
      b. C203 - Coal-Tar Protective Coatings and Linings for Steel Water Pipelines -Enamel and Tape- Hot-Applied.
      c. C205 - Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4 Inch and Larger - Shop Applied.
      d. C206 - Field Welding of Steel Water Pipe.
      e. C209 - Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections, and Fittings for Steel Water Pipelines.
      f. C600 - Installation of Ductile Iron Water Mains and Their Appurtenances.
      g. C651- Disinfecting Water Mains.
      h. M9 - Concrete Pressure Pipe.
      i. M11 - Steel Pipe - A Guide for Design and Installation.
      j. M23 - PVC Pipe - Design and Installation.
      k. M55 - PE Pipe - Design and Installation.
   3. Federal Specifications (FS):
      a. SS-S-00210 - Sealing Compound, Preformed Plastic, For Expansion Joints and Pipe Joints.

1.03 DELIVERY, STORAGE AND HANDLING:

A. Handle in a manner to ensure installation in sound and undamaged condition.
   1. Do not drop or bump.
   2. Use slings, lifting lugs, hooks, and other devices designed to protect pipe, joint elements, linings, and coatings.

B. Ship, move, and store with provisions to prevent movement or shock contact with adjacent units.

C. Handle with equipment capable of work with adequate factor of safety against overturning or other unsafe procedures.

D. Pipe openings shall be covered during shipment.
E. Inside of pipe shall kept clean and free of debris during on-site storage.
F. Staged PVC Pipe shall remain covered and protected from ultraviolet light (sun) until it is prepared for installation.

PART 2 - PRODUCTS Specified in respective Sections, this Division.

PART 3 - EXECUTION

3.01 EXCAVATION, TRENCHING, BEDDING, AND BACKFILLING:

A. Conform to Section 31 23 33 and as follows:
1. Limit trench excavation ahead of last pipe installed to not more than 200 feet.
2. Over-excavate unsuitable material as determined by Engineer and backfill to bottom of bedding grade with approved compacted material, at no additional expense to Owner.
3. Maintain trenches in a dewatered condition from start of trench to completed backfill.
4. Use, install, and remove sheeting as specified in Section 31 20 50.
5. All joints not previously pressure tested shall be left uninsulated and exposed for examination prior to backfill. Code provided exceptions to visual examination prior to backfill shall be approved by Engineer prior to commencing excavation.
6. Limit open trench behind pipe installation to not more than 200 feet.
7. Ensure that the embedment material is carefully worked and compacted under the haunches of the pipe.
8. Place remainder of backfill and compact as specified in Division 31.
9. During compaction, take care to prevent direct contact with the pipe by tools or mechanical equipment and avoid impacting or deflecting the pipe by placement of compaction equipment directly over the pipe.
10. Perform all Work under and adjacent to buildings as specified in Division 01.
11. Use sheeting and bracing as needed to protect existing structures and facilities.
12. Take special care when performing Work immediately adjacent to existing structures and facilities. Structures and facilities damaged by Contractor's operations shall be replaced by Contractor at no cost to Owner.

3.02 INSTALLATION - GENERAL:

A. Use equipment, methods, and materials ensuring installation to lines and grades indicated.
1. Maintain within tolerances specified or acceptable laying schedule.
a. Alignment: ±1 inch per 100 feet.
b. Grade: ±1 inch per 100 feet.
2. Do not lay on blocks unless pipe is to receive total concrete encasement.
3. Accomplish horizontal and vertical curve alignments with bends, bevels, and joint deflections.
a. Limit joint deflection with ductile iron pipe to conform to AWWA C600.
4. Obtain acceptance of method proposed for transfer of line and grade from control to the Work.
B. Install pipe of size, materials, strength class, and joint type with embedment indicated for plan location.
C. Clean interior of all pipe, fittings, and joints prior to installation. Exclude entrance of foreign matter during installation and at discontinuance of installation.
1. Close open ends of pipe with snug-fitting closures.

2. Do not let water fill trench. Include provisions to prevent flotation should water control measures prove inadequate.
3. Remove water, sand, mud, and other undesirable materials from trench before removal of end cap.

D. Brace or anchor as required to prevent displacement after establishing final position.
E. Perform only when weather and trench conditions are suitable. Do not lay in water, snow, or ice.
F. Observe extra precaution when hazardous atmospheres might be encountered.

3.03 JOINTING:

A. General Requirements:
1. Locate joint to provide for differential movement at changes in type of pipe embedment, impervious trench checks, and structures.
a. Not more than 8 inches from structure wall, or
b. Support pipe from wall to first joint with concrete cradle structurally continuous with base slab or footing.
c. As indicated.
2. Perform conforming to manufacturer's recommendations.
3. Clean and lubricate all joint and gasket surfaces with lubricant recommended.
4. Use methods and equipment capable of fully seating or making up joints without damage.
5. Check joint opening and deflection for specification limits.

B. Special Provisions for Jointing Ductile Iron Pipe:
1. Conform to AWWA C600.
2. Visually examine while suspended and before lowering into trench.
a. Paint bell, spigot, or other suspected portions with turpentine and dust with cement to check for cracks invisible to the eye.
b. Remove turpentine and cement by washing when test is satisfactorily completed.

C. Special Provisions for Jointing Steel Pressure Pipe:
1. Conform to AWWA M11.
2. Check for holidays in coating and make repairs as required.
3. Weld pipe and fittings to conform to AWWA C206.
4. Grout inside joints of welded pipe and fittings mortar lined conforming to AWWA C205.
5. Apply epoxy coating to inside of welded joints in pipe 24 inches and larger.
6. Apply cold tape coating conforming to AWWA C209 to buried exterior connections, special sections, fittings, couplings, and bare metal.

D. Special Provisions for Jointing PVC Pipe and Composite Sewer Pipe:
1. Conform to ASTM D2321. Pressure pipe installation shall also conform to AWWA M23.
2. Excavate bell holes at each joint or coupling to provide full length barrel support of the pipe and to prevent point loading at the bells or couplings.
3. Seal cut face of any joint of Composite Sewer Pipe installed to prevent exfiltration during air testing.
4. Connect pipe to new or existing rigid structures or manhole tie-ins with manhole couplings.

E. Special Provisions for Grooved-End and Shouldered Type Joints:
1. Use fittings and couplings that are made by the same manufacturer that are listed for use together.

2. Assemble joints with coupling, gasket, lubricant, and bolts according to manufacturer's written instructions.

3.04 ELECTRICAL BONDING AND INSULATION:

A. Electrically bond adjacent lengths of pipe and fittings unless otherwise indicated.
B. Use materials specified in Section 33 11 00 - Pressure Pipe applied to conform to manufacturer's instructions.
C. Install insulated joints of dielectric materials.
   1. Where indicated.
   2. Between dissimilar materials which could cause galvanic action.
   3. Conform to manufacturer's instructions.

3.05 CUTTING:

A. Cut in neat manner without damage to pipe.
B. Observe Contract Specifications regarding joint locations.
C. Cut ductile iron and steel pipe with carborundum saw or other acceptable method per manufacturer's instructions.
   1. Smooth cut by power grinding to remove burrs and sharp edges.
   2. Repair lining as required and approved.

3.06 CLOSURE PIECES:

A. Connect two segments of pipeline or a pipeline segment and existing structure with short sections of pipe fabricated for the purpose.
B. Observe Contract Specifications regarding location of joints, type of joints, pipe materials, and strength classifications.
C. Field-fabricated closures, where required, shall be concrete encased between adjacent flexible joints.
D. May be accomplished with sleeve coupling:
   1. Of length such that gaskets are not less than 3 inches from pipe ends.
   2. Wrap exterior of buried steel couplings with polyethylene encasement conforming to AWWA C105.

3.07 TEMPORARY PLUGS:

A. Furnish and install temporary plugs at each end of Work for removal by others when completed ahead of adjacent contract.
B. Plugs:
   1. Test plugs as manufactured by pipe supplier.
   2. Fabricated by Contractor of substantial construction.
   3. Secured in place in a manner to facilitate removal when required to connect pipe.

3.08 CONNECTIONS TO EXISTING STRUCTURES:

A. Connect pipe to existing structures and pipelines where indicated.
B. Prepare structure by making an opening with at least 3 inches clearance all around fitting to be inserted.
C. Observe pertinent articles of Contract Specifications pertaining to joint locations and closures.
D. Repair wall opening with nonshrinking grout.

3.09 POLYETHYLENE ENCASEMENT:

A. Encase pipe, fittings, valves, and other appurtenances with polyethylene film as indicated or specified.
B. Materials:
   1. Polyethylene material shall be as follows:
      a. Conform to AWWA C105.
      b. Class C (Black).
   2. Adhesive tape shall be as follows:
      a. Approximately 2 inches wide and plastic backed.
      b. Capable of bonding securely to metal surfaces and/or polyethylene material.
      c. Polyken No. 900, Scotchrap No. 50, or Engineer approved equal.
C. Installation:
   1. Perform to conform to AWWA C105.
   2. Use adhesive tape to fasten polyethylene film in place.
   3. Minimize exposure of polyethylene film to sunlight.
   4. Wrap pipe, valves, fittings, and couplings per AWWA C105 installation standards.
   5. Repair any cuts, tears, punctures, or damage to polyethylene film with PVC tape or short length of polyethylene sheet or cut open tube, wrapped around pipe to cover damaged area and secure in place.
   6. Prevent damage to film by assuring that backfill material is free from cinders, refuse, boulders, rocks, stoned or other material that could damage the film. Follow AWWA C600 for backfilling.

3.10 TRACER WIRE:

A. All utility main installations shall include the installation of a single tracing wire taped to the top of the pipe.
   1. Tracer wire shall be secured at no less than three locations per length of pipe and at every fitting or change in direction.
B. The tracing wire shall be installed in a continuous run and the ends of the tracer wire shall be brought to the surface in test stations.
   1. Trace wire shall be routed around manholes/vaults and brought up into test stations/tracer wire boxes located adjacent to the utility marker posts and secured with a stainless steel strap or as otherwise directed by Owner and/or Engineer.
C. Wire splices shall be accomplished using a mechanical connector and sealed with an epoxy type material.

3.11 FIELD TESTING:

A. Acceptance Tests for Gravity and Low-Pressure Pipelines:
   1. Alignment:
      a. Sewer shall be inspected by flashing a light between manholes or by physical passage where space permits.
      b. Contractor shall clean pipe of excess mortar, joint sealant, and other dirt and debris prior to inspection.
      c. Determine from Illumination or Physical Inspection:
         (1) Presence of any misaligned, displaced, or broken pipe.
         (2) Presence of visible infiltration or other defects.
      d. Correct defects as required prior to conducting leakage tests.
   2. Leakage Test:
      a. Contractor shall perform by exfiltration method on all pipe installed.
      b. Furnish water and all facilities required including:

(1) Necessary piping connections.
(2) Test pumping equipment.
(3) Water meter.
(4) Pressure gauge.
(5) Bulkheads.
(6) All miscellaneous items required.

c. Obtain acceptance of equipment and acceptance of methods proposed for use.
d. Conduct initial test on first section of pipe laid and then every 500 feet of installed pipe
(1) Include a minimum of 10 lengths of pipe but not to exceed 300 feet.
(2) Perform before backfilling.
(3) Satisfactorily complete test before crew is permitted to continue pipe installation.
e. Test remaining pipe in sections determined by Contractor and approved by Engineer.
f. Perform at test pressures specified as measured: Ductile iron, RCP, PVC, and Composite Pipe, not less than 4 feet of water above the invert of the sewer at the upstream manhole nor more than 20 feet of water.
g. Maintain test as necessary to locate all leaks but not less than two hours.
h. Repeat as necessary after repair of leaks and defects until leakage as measured does not exceed limits listed in gallons per inch of internal diameter per hour per 100 feet of pipe length:

	Gallons
(1) Sanitary and industrial waste sewer	0.15

i. Protect manholes and other structures by means of bulkheads to prevent bursting pressures from being applied inside the structure.
j. Dewater pipe and manholes upon completion of testing.

3. Deflection Testing for Gravity Pipelines:
a. All systems flowing by gravity and constructed of PVC pipe shall be tested for vertical ring deflection using a properly sized "Go, No-Go" Mandrel, or sewer ball.
b. Maximum allowable vertical ring deflection shall be 5% of the pipe mean internal diameter.
c. Pipe shall be tested after backfill and compaction has been in place for 30 days.
d. Mandrel shall be suitable for the pipe type installed and maximum allowed deflection specified.
e. Any pipe not meeting deflection limits shall be removed and replaced.

B. Acceptance Tests for Pressure Pipelines:
1. Perform hydrostatic pressure and leakage tests.
a. Conform to AWWA C600 procedures.
(1) As modified herein.
(2) Shall apply to all pipe materials specified.
b. Perform after backfilling.
2. Test separately in segments between sectionalizing valves, between a sectionalizing valve and a test plug, or between test plugs.
a. Select test segments such that adjustable seated valves are isolated for individual checking.
b. Contractor shall furnish and install test plugs.
(1) Including all anchors, braces, and other devices to withstand hydrostatic pressure on plugs.

(2) Be responsible for any damage to public or private property caused by failure of plugs.

3. Limit fill rate of line to available venting capacity. Fill rate shall be regulated to limit velocity in lines when flowing full to not more than 0.05 to 1 fps.
4. Owner shall make water for testing available to Contractor at nearest source.
5. Pressure and Leakage Test:
   a. Test pressure shall not be less than 1.5 times the working pressure at the highest point along the test section.
   b. Be at least 2-hour duration. Maintain pressure throughout test $\pm$5 psi of test pressure.
   c. Leakage test shall be conducted concurrently with the pressure test.
   d. Acceptable when leakage does not exceed that determined by the following formula:

$$L = 0.0000075\ SD(P)^{1/2}$$

L = allowable leakage (gallons per hour)
S = length of pipe tested (feet)
D = nominal diameter of the pipe (inches)
P = average actual leakage test pressure (psig)

   e. These formulas are based on an allowable leakage of 11.65 gpd/mile/in of nominal diameter at a pressure of 150 psi.
   f. When testing against closed metal-seated valves, an additional leakage per closed valve of 0.0078 gal/hr/in of nominal valve size shall be allowed.
   g. When hydrants are in the test section, the test shall be made against the main valve in the hydrant.
   h. Repeat test as necessary.
      (1) After location of leaks and repair or replacement of defective joints, pipe, fittings, valves or hydrants. All visible leaks are to be repaired regardless of the amount of leakage.
      (2) Until satisfactory performance of test.
   i. Owner and/or Engineer will witness pressure and leakage test.
6. Soil Corrosion Testing
   a. Perform electrical conductivity test on bonded pipe segments.
   b. Perform pipe-to-soil potential surveys.
   c. Submit 3 copies of test and survey reports to Engineer.

END OF SECTION 33 31 50

SECTION 33 32 22 - SUBMERSIBLE PUMPS

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section covers furnishing and installing submersible influent wastewater pumps and the plant sewer pumps as indicated and specified.

B. Submersible pumps shall be furnished complete with pump casings, shafts, bearings, seals, lubrication, piping assemblies, guide rails, anchor bolts, motors, controls, power cable, and all other parts and accessories indicated, specified, or required for proper installation, operation, and maintenance.

C. Pumps shall be capable of pumping influent wastewater.

D. Related Work Specified Elsewhere:
   1. Protective Coatings: Division 9.
   2. Electrical: Division 26.
   3. Motors: Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment.
   4. Instruments and Control Systems: Division 40.
   5. Manufacturer's Field Services: Division 1.
   6. Piping and Accessories: Division 33.

1.02 REFERENCES:

A. Applicable Standards:
   1. American National Standards Institute (ANSI):
      a. B16.1 - Cast-Iron Pipe Flanges and Flanged Fittings.
   2. American Society for Testing and Materials (ASTM):
      a. A48 – Gray Iron Castings.
   3. American Iron and Steel Institute (AISI).
   4. American Bearing Manufacturer's Association (ABMA).
   5. Hydraulic Institute Standards (HIS).
   6. National Electrical Manufacturer's Association (NEMA).
   7. Institute of Electrical and Electronics Engineers (IEEE).
   8. National Fire Protection Association (NFPA):
      a. 70 - National Electrical Code (NEC).
   9. Underwriters Laboratories, Inc (UL):
      a. 508 - Industrial Control Equipment.

1.03 SUBMITTALS:

A. Submit as specified in Division 1.

B. Submittals shall include, but not be limited to, the following:
   1. General arrangement drawing of pump, motor and base with proposed equipment data highlighted. Manufacturer shall submit statement indicating that proposed installation is in compliance with HI and manufacturer requirements. All units shall be in English Units.
   1. Standard performance curves for each pump model furnished. Curves shall cover range from shutoff through the pump’s complete allowable operating range at the conditions specified, and shall be submitted for the following parameters as a function of pump capacity and speed at design temperature:
      a. Total developed head.
      b. Required brake horsepower.

c. Pump efficiency.
d. Net psositive suction head (NPSH3).
e. Minimum recommended submergence.

2. Mechanical details including impellers, bearings, couplings and seals.
3. Submit layout, dimensional and cross-section drawings.
4. Manufacturer's standard protective coating system.
5. Motor performance data and results of shop test.
6. Pump nameplate data.
7. Motor nameplate data.
8. Base elbow details.
9. Weights:
   a. Total each unit.
   b. Pump.
   c. Motor.
   d. Base elbow.
10. Bearing life calculations showing the pump meets or exceeds the L-10 life specified in part 2.06.E.1 of this specification section.

C. Perform witnesed factory performance test for each pump in accordance with HI 14.6. Pumps shall meet 1U test tolerance per HI 14.6.3.4.
   1. Provide all factory test logs showing flow, discharge pressure, brake horsepower, input power, and pump efficiency. Provide sample calculations and instrument calibration information.

D. Perform hydrostatic test on each pressure-containing component per HI 14.6 appendix B.

E. Operation and Maintenance Manual includes, but not limited to, the following:
   1. Special shipping, storage, protection, and handling instructions including dimensions of each container or package shipped.
   2. Recommended unloading method at project site including implement (e.g., forklift, etc.) and maximum container or package weight.
   3. Manufacturer’s printed installation instructions.
   4. The manual shall be prepared specifically for this installation and shall include all required cuts, drawings, wiring diagrams, equipment lists, descriptions, etc. that are required to instruct operating and maintenance personnel unfamiliar with such equipment. The maintenance instructions shall include trouble shooting data, full preventative mainteance schedule and complete spare parts lists with order information. In addition the manuals shall include the following at a minimum:
      a. Complete parts list cross-referenced to an exploded biew assemby or equivalent drawing.
      b. Dimensional drawings of all provided equipment with component weights.
      c. Complete preventative maintainence procedures (including reccomended intervals).

F. Certifications:
   1. Manufacturer’s or Manufacturer Representative’s Certificate of proper installation and start-up.
   2. Field performance test procedures.
   3. Submit complete, signed report of results of field inspection, operation, adjustments, and tests. Include the Manufacturer’s certificate that the equipment is ready for permanent operation and that nothing in installation will affect Manufacturer’s warranty in any manner, or render warranty null and void.

1.04 QUALITY ASSURANCE:

A. All items of equipment specified herein shall be furnished by one Manufacturer. This Manufacturer shall have the responsibility of providing the equipment, accessories, controls, installation supervision, and testing services required to provide a functioning system.
B. Like items of equipment provided hereunder shall be the end products of one Manufacturer in order to achieve standardization for appearance, operation, maintenance, spare parts, and Manufacturer's service.
C. Manufacturer to provide specific standard factory tests and reports for each pump.
D. The contractor shall provide all piping and appurtenances for the suction and discharge piping shown on the Drawings. The contractor shall make any necessary adjustments to the suction and discharge piping based on the selected pump manufacturer at no additional cost to the Owner.

1.05 FACTORY ASSEMBLY:

A. Pump/motor units shall be completely shop assembled and aligned prior to shipping.
B. After completion of the specified factory tests, pumps shall be prepared for shipment with the minimum amount of disassembly, and such that no field disassembly, cleaning, or flushing is required.
C. Any components removed for shipping shall be match-marked prior to removal and shipment.
D. Prepare surfaces and provide paint system standard of the manufacturer and suitable for service intended. Submit paint type and manufacturer’s specification with Submittals.

1.06 DELIVERY, STORAGE, AND HANDLING:

A. Shall be as specified in Division 1.

1.07 WARRANTY:

A. The Manufacturer shall warrant that all Equipment shall be free of defects caused by faulty material or workmanship for a minimum period of one (1) year.
B. Multiple warranties for individual components shall not be acceptable.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Ebara.
B. Flygt, a Xylem brand.
C. HOMA.
D. KSB.
E. Sulzer - ABS.

2.02 GENERAL REQUIREMENTS:

A. Submersible pumps shall be furnished complete with pump casings, shafts, bearings, seals, lubrication, piping assemblies, guide rails, anchor bolts, motors, power cable, and all other parts and accessories indicated, specified, or required for proper installation, operation, and maintenance.
B. Provide totally sealed submersible electrically operated pump capable of pumping raw wastewater.
C. Provide pump capable of operating continuously for extended periods of time without damage.
D. Pump design point shall fall within the preferred operating range.

E. Pump shall operate at or near maximum efficiency at operating conditions.
F. Pump head-capacity curve shall be continuously falling from shutoff head.
G. Pump discharge connection elbow and discharge piping shall be installed such that pump will automatically connect and seal to discharge connection elbow when lowered into place.
H. Pump shall be easily removable for inspection or service.
I. Provide guide rail system and pump rail guide bracket to raise or lower pump unit by Type 316 stainless steel chain or cable..
J. Guide entire weight of pump unit with a minimum of two single-piece guide bars.
K. Seal interface of the pump and discharge elbow by metal-to-metal contact or profile gasket.
L. Motor shall be suitable for use with variable speed drive.
M. Pumps shall be able to pump 3-inch diameter solids.
N. Motor shall be inverter duty rated.
O. Influent pumping will require automatic operation 24 hours per day, 7 days a week.
P. Plant sewer pumping will require automatic operation 24 hours per day, 7 days a week.
Q. All electrical equipment to be rated for installation in a Class 1, Division 1, Group D area.
R. For the Influent Pumps, provide an integral closed loop cooling system that circulates glycol through a jacket surrounding the motor designed for a wet well elevation at the top of the pump volute without requiring the liquid level in the wet well for cooling.
    1. A stainless steel cooling jacket shall encircle the stator housing, providing for dissipation of motor heat regardless of the type of pump installation.
    2. An impeller, integral to the cooling system and driven by the pump shaft, shall provide the necessary circulation of the cooling liquid through the jacket.
    3. The cooling liquid shall pass about the stator housing in the closed loop system in turbulent flow providing for heat transfer.
    4. The cooling system shall have one fill port and one drain port integral to the cooling jacket. Cooling jackets with internal cooling or using pumpage in a cooling jacket is unacceptable.

2.03 DESIGN REQUIREMENTS – INFLUENT HIGH FLOW PUMPS: Pumps shall be designed for the following:

A. Number of Units: 3
B. Equipment Tags: IPS-PMP-110, IPS-PMP-120, IPS-PMP-150
C. Design Capacity, Pump Station Peak Flow
    1. Static Head: 84.33 feet
    2. Total Dynamic Head: 101.6 feet
    3. Flow: 3,150 gpm
    4. Minimum Overall Efficiency: 73%
D. Design Capacity, One Pump Operating at Max Flow
    1. Static Head: 82.13 feet
    2. Total Dynamic Head: 90.5 feet
    3. Flow: 3,810 gpm
    4. Minimum Overall Efficiency: 73%
E. Shutoff Head (minimum): 150 feet.
F. Runout Head (maximum): 60 feet
G. Maximum Motor Speed: 1,800 rpm
H. Maximum Motor Horsepower: 150 hp
I. Pump Volute Discharge Diameter: 10-inch
J. Maximum Water Depth in Wet Well: 11 feet
K. Minimum Water Depth in Wet Well: 2.5 feet

2.04 DESIGN REQUIREMENTS – INFLUENT LOW FLOW PUMPS: Pumps shall be designed for the following:

A. Number of Units: 2
B. Equipment Tags: IPS-PMP-130, IPS-PMP-140
C. Design Capacity, Pump Station Peak Flow
   1. Static Head: 84.33 feet
   2. Total Dynamic Head: 99.6 feet
   3. Flow: 1,180 gpm
   4. Minimum Overall Efficiency: 65%
D. Design Capacity, One Pump Operating at Max Flow:
   1. Static Head: 81.83 feet
   2. Total Dynamic Head: 86.2 feet
   3. Flow: 1,490 gpm
   4. Minimum Overall Efficiency: 65%
E. Shutoff Head (minimum): 150 feet
F. Runout Head (maximum): 60 feet
G. Maximum Motor Speed: 1,800 rpm
H. Maximum Motor Horsepower: 50 hp
I. Pump Volute Discharge Diameter: 6-inch
J. Maximum Water Depth in Wet Well: 11 feet
K. Minimum Water Depth in Wet Well: 2.5 feet

2.05 DESIGN REQUIREMENTS – PLANT SEWER PUMPS: Pumps shall be designed for the following:

A. Number of Units: 2
B. Equipment Tags: PSEW-PMP-110, PSEW-PMP-120
C. Design Capacity, One Pump Operating at Max Flow
   1. Static Head: 48 feet
   2. Total Dynamic Head: 63 feet
   3. Flow: 860 gpm
   4. Minimum Overall Efficiency: 63%
D. Maximum Motor Speed: 1,800 rpm
E. Maximum Motor Horsepower: 25 hp
F. Pump Volute Discharge Diameter: up to 6-inch
G. Maximum Water Depth in Wet Well: 9.25 feet
H. Minimum Water Depth in Wet Well: 2.5 feet

2.06 MATERIALS AND CONSTRUCTION:

A. Construct motor housing, pump casing, and major pump components of cast iron conforming to ASTM A48 Class 30 or superior.
B. Provide bolts, nuts, and washers of AISI Series 300 stainless steel.
C. Impeller:
   1. Cast iron. Manufacturer standard impeller material may be acceptable if approved by Engineer.
   2. Nonclog design.
   3. Secured to shaft with key and self-locking device to prevent slipping in either direction.
   4. Balanced statically and dynamically to the ISO 1940 standard Grade G6.3 or superior to eliminate vibration and minimize hydraulic end thrust.
   5. Castings shall not have been repaired by plugging, welding, or other means.

6. Provide renewable stainless steel or bronze casing wearing ring for efficient sealing between volute and impeller for enclosed impellers. Provide impeller wear rings on impellers. Wear rings shall be of dissimilar materials or have a minimum hardness difference of 50 BHN.

D. Shaft:
1. Ample diameter to assure first critical speed will occur at not less than 150 percent of rated pump speed.
2. Manufacturer's standard stainless steel.

E. Bearings:
1. Minimum L-10 life of 100,000 hours at the design point(s).
2. Pump shaft to rotate on two (upper and lower) permanently lubricated bearings without end movement.

F. Shaft Seal:
1. Two mechanical seals in oil bath reservoir shall seal pumped liquid from motor compartment.
2. Moisture detector shall be installed in oil seal chamber and connected to pump controls.
3. Seal faces shall be made of tungsten carbide, carbon, ceramic, or silicon carbide.

2.07 ACCESSORIES:

A. Pump Discharge Connection:
1. Connected to discharge piping and anchored to sump floor with stainless-steel anchor bolts.
2. Designed to receive pump discharge connection without bolts.
3. Integral with guide rail.
4. Cast or ductile iron.
5. Flanges shall conform to ANSI B16.1.

B. Guide Supports:
1. Fasten stainless-steel guide supports so that no lifting loads are applied to pump or motor housing.

C. Lifting Chain and/or Cable:
1. Provide one stainless-steel chain or cable for each pump.
2. Design to raise and lower pump with additional safety factor for overcoming force of pump hang-ups.
3. Provide hook for chain or cable when not in use.
4. Provide chain and/or cable with length as needed for each pump's wet well. Refer to contract drawings for wet well dimensions.

D. Guide Rails:
1. 316 Stainless-steel pipe and shall be one continous pipe.
2. All 316 stainless steel, including rails, brackets, and anchor bolts.
3. Size as recommended by pump manufacturer.
4. Shall not support any portion of the pump weight.
5. Provide a minimum of two guide rails.

E. Cables and Accessories:
1. Provide continuous cables from the motor to the indicated motor terminating junction box or power disconnect switch when the motor is in operating position.
2. The outer jacket of the cable shall be UV/sunlight, oil, water and hydrogen sulfide resistant and shall be capable of continuous submerged operation underwater to a depth of 65 feet.
3. Cables shall be sized according to NEC and CSA Standards.

4. Cables shall be easily adjusted to pumping level without splices.
5. Provide stainless steel grip holders for pump and control cables.
6. Pump power cables shall include overall copper shielding for entire length of cable.

2.08 ELECTRICAL EQUIPMENT:

A. Conform to NEC, NEMA, IEEE and Divisions 26 and 40 on all electrical equipment and controls.
B. Provide motors and accessories as specified in Section 46 05 13.
C. Rated for 460-volt, 3 phase, 60-hertz operation. Designed for operation with variable frequency drive.
D. Provide motor with service factor of 1.15.
E. Motors shall be equipped with thermal sensors attached to or imbedded in the motor windings and connected to pump controls.
F. Motors shall be equipped with a moisture sensor and connected to pump controls.
G. For motors larger than 50 HP:
    1. Provide motor housing leak detection.
    2. Provide PT100 sensor in lower bearing.
H. Motors shall be equipped with additional standard sensors, as recommended by the manufacturer.
I. Each pump shall be supplied with a manfacturer's standard protection relay, rated for 120Vac operation. Coordinate with the Contractor to install the relay at the motor starter and provide the following functions:
    1. Monitor pump motor temperature switch. Shutdown pump on high temperature.
    2. Detect moisture inside pump motor. Initiate warning signal on moisture detection.
    3. Monitor any additional sensors. Shutdown pump or initiate warning signal, as recommended by the manufacturer.
J. Provide each pump with with inlet and receptacle pair(s) for complete electrical disconnect of the pump motor and accessories.
    1. Provide inlet and receptacle with the following quantity of pins:
        a. Power contacts: 3 phases and ground.
        b. Instrumentation contacts:
            (1) Provide auxiliary contacts as required for connection to the pump's moisture and thermal protection elements.
                (a) Include 2 additional auxiliary contacts for the plant sewer pumps. Contacts shall be jumpered within inlet to indicate disconnect of pump motor.
            (2) If quantity of required auxiliary contacts is not available for the disconnecting assembly, provide the following:
                (a) Additional inlet and receptacle pair for disconnect of all moisture and thermal protection elements.
                (b) Additional pump control cable for all moisture and thermal protection elements.
    2. Provide power inlet as follows:
        a. Pump power cable overall shield and ground conductor shall be terminated to the ground contact.
        b. Metal handle.
        c. Cable reducers as necessary.
        d. Protective inlet cap.
    3. Provide power receptacle as follows:

a. Designed for connection to inlet.
b. Angle - 60°.
c. Cable reducers as necessary.
d. Padlockable pawl with locking pin.

4. The above requirements are minimum. Provide inlet and receptacle pairs with all parts required for a complete installation.
5. Provide the pump power inlet and receptacle pairs as follows:
   a. Influent Pumps – Meltric, DR400 or Engineer-approved equal.
   b. Plant Sewer Pumps – Meltric DSN60 or Engineer-approved equal.

2.09 ANCHOR BOLT ASSEMBLY:

A. Complete anchor bolt assembly (studs, nuts, washers, etc.) to be designed and provided by the Manufacturer. Anchor material shall be 316 SST. Anchor size and embedment shall be clearly shown on the equipment drawings.

2.10 SPARE PARTS:

A. The following shall be provided:
   1. A complete set of bearings.
   2. A complete set of case and impeller wear rings.
   3. A complete upper and lower mechanical seal or a seal repair kit.
B. All parts supplied with the equipment shall be properly labeled for ease of identification and to permit the shortest possible time to repair. Any parts that come from a sub-supplier shall be labeled with that manufacturer's name and part number.
C. Manufacturer shall warrant that all parts shall be available for a minimum of ten years.

2.11 PROTECTIVE COATINGS:

B. Shop Painting:
   1. Prepare surfaces, prime, and finish paint all iron and steel surfaces as specified in Section 09 90 00.
   2. Prepare surface of damaged and uncoated areas and touch-up as required for complete protection
   3. All nameplates, bronze or stainless steel surfaces shall not be painted.

PART 3 - EXECUTION

3.01 INSTALLATION, START-UP, AND TESTING:

A. All Work shall conform to manufacturer's recommendations and the requirements of Division 1.
B. Perform all installation and finishing requirements as specified in Section 46 05 13.
C. Make all electrical and control connections.
D. Provide all necessary lubrication for initial start-up, testing and as required for final acceptance.
E. Provide a complete unit with all materials, components and adjustments as required for successful operation.
F. Installation, start-up and testing of all equipment and associated construction shall conform to manufacturer's recommendations.
G. Do not place grout for pump pedestal bases until pumps are complete aligned.
H. Install pipe and pipe appurtenance supports to minimize stresses being placed on pump.

3.02 MANUFACTURER'S FIELD SERVICE:

A. Provide installation, start-up, and testing services for all Equipment as specified in Division 1.
B. Manufacturer shall certify in writing that equipment has been inspected, is properly installed, and is ready for initial startup. Manufacturer shall be present for testing as indicated in the applicable portion of this specification.
C. Provide a minimum of four (4) hours of service for training of Owner's personnel. Training shall include:
    1. Operation, start-up, shut-down, lock-out, emergency operating procedures, contol, adjustment, maintenance, assembly, disassemblu, and repair of the equipment including control sequences, identification systems, materials, spare parts, special tools, lubricants and fuels.
    2. Technical repair manual.
    3. Cleaning.
    4. Lubrication of equipment.
    5. Optimizing equipment and system performance.
    6. Capabilities of equipment and systems.
    7. Operational safety of equipment and systems.
    8. Emergency situation response of equipment and systems.

3.03 PERFORMANCE TESTS:

A. As specified in Division 1.
B. Conduct in the presence of General Contractor, Owner, and/or Engineer.
C. Provide Field Quality Control as specified in Section 46 05 13.
D. Equipment Tests:
    1. Check performance of all components as a functioning unit.
    2. Megger stator and power cables.
    3. Check seal lubrication.
    4. Check for proper rotation.
    5. Check power supply voltage.
    6. Measure motor operating load and no load current.
    7. Motors: Insulation (megger) test, rotational direction (bump) test and visual inspections required by NETA ATS.
E. Operational Tests:
    1. Conduct such operational tests as necessary to determine that the performance of Equipment and controls is as specified.
    2. Tests will generally consist of placing Equipment in operation under varying conditions and observing performance.
    3. Test reports will include flowrate, speed, current draw, pump discharge pressure, and sump water level under varying conditions from 50% (or minimum flowing speed based on field conditions) to 100% speed, at minimum 10% intervals.
F. Make all necessary Equipment adjustments and corrective work indicated by tests.
G. Submit a written test report to Owner with one copy to Engineer in a letter form stating operations performed and results obtained for each unit.

3.04 INSPECTION:

A. Inspection:
    1. Perform on Equipment unit by manufacturer's representative.
    2. Perform within 60 days prior to date of warranty expiration.
    3. Ascertain or appraise the following:

a. Status of Equipment and installation after normal usage.
b. Adherence to manufacturer's recommended maintenance and operation of Equipment.

4. Include the following:
   a. Alignment checks.

B. Make adjustments necessary to restore Equipment within original tolerances.

C. Submit a written letter report to Owner with copy to Engineer covering the inspection items and including recommendations where applicable.

END OF SECTION 33 32 22

SECTION 33 31 11 – GRAVITY PIPING

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes all gravity pipe, fittings, and specials.

B. Related Work Specified Elsewhere:

1. Section 31 20 50 - Site Preparation and Earthwork.
2. Section 33 39 00 - Utility Structures.

1.02 REFERENCES:

A. Applicable Standards:

1. ASTM International (ASTM):
   a. C76 – Standard Specification for Reinforced Concrete Culvert, Storm Drain.
   b. D1248 – Polyethylene Plastics Molding and Extrusion Materials.
   c. D1784 – Rigid Poly(Vinyl Chloride) and Chlorinated Poly(Vinyl Chloride) Compounds.
   d. D2241 – Standard Specification for Poly(Vinyl Chloride) (PVC) Pressure-Rated Pipe (SDR Series).
   e. D2321- Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications.
   f. D2412 – Standard Test Method for Determination of External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading.
   g. D2683 – Standard Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing.
   h. D2774 – Standard Practice for Underground Installation of Thermoplastic Pressure Piping.
   a. D3035 – Standard Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) Based on Controlled Outside Diameter.
   i. D3212 – Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.
   j. E3261 – Standard Specification for Butt Heat Fusion Polyethylene Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing.
   k. D3350 – Standard Specification for PE Pipe & Fittings Material.
   l. F412 – Standard Terminology Relating to Plastic Piping Systems.
   m. F477 – Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
   n. F714 – Standard Specification for PE Pipe (DR-PR) Based on Outside Diameter.
   o. F1417 – Standard Practice for Installation Acceptance of Plastic Non-pressure Sewer Lines Using Low-Pressure Air.
   p. F1803 – Poly (Vinyl Chloride) (PVC) Closed Profile Gravity Pipe and Fittings Based on Controlled Inside Diameter.
   q. F2026 – Standard Practice for Heat Fusion Joining of Polyethylene Pipe and Fittings.
   r. F2206 – Standard Specification for Fabricated Fittings of Butt-Fused Polyethylene (PE).
   s. F2620 – Standard Practice for Heat Fusion Joining of Polyethylene Pipe and Fittings.
   t. F3124 – Standard Practice for Data Recording the Procedure Used to Produce Heat Butt Fusion Joints in Plastic Piping Systems or Fittings.
   u. F3183 – Standard Practice for Guided Side Bend Evaluation of Polyethylene Pipe Butt Fusion Joint.

v. F3190 - Standard Practice for Heat Fusion Equipment (HFE) Operator Qualification on Polyethylene (PE) and Polyamide (PA) Pipe and Fittings.

2. American Water Works Association (AWWA):
   a. C900 – Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 In. Through 12 In. for Water Transmission and Distribution.
   b. C906 – Polyethylene (PE) Pressure Pipe & Tubing, 4-Inch Through 63-Inch for Waterworks.
   c. M23 – PVC Pipe-Design and Installation.

   c. TR-3 – Policies and Procedures for Developing Hydrostatic Design Basis (HDB), Pressure Design Basis (PDB), Strength Design Basis (SDB), and minimum Required Strength (MRS) Ratings for Thermoplastic Piping Materials or Pipe.
   d. TR-4 – HDB/SDB/PDB/MRS Listed Materials, PPI Listing of Hydrostatic Design Basis (HDB), Strength Design Basis (SDB), Pressure Design Basis (PDB), and Minimum Required Strength (MRS) Ratings for Thermoplastic Piping Materials or Pipe.
   e. TR-9 – Recommended Design Factors for Pressure Applications of Thermoplastic Pressure Pipe Materials.
   f. TR-33 – Generic Butt Fusion Joining Procedure for Field Joining of Polyethylene Pipe.
   g. TN-42 – Recommended Minimum Training Guidelines for PE Pipe Butt Fusion Joining Operators for Municipal and Industrial Projects.
4. Uni-Bell PVC Pipe Association:
   a. UNI-B-6-98 – Recommended Practice for Low-Pressure Air Testing of Installed Sewer Pipe.

1.03 SUBMITTALS:

A. Submit as specified in Division 1.
B. Submit the following for acceptance prior to fabrication:
   1. Pipe and joint details.
   2. Special, fitting, and coupling details.
   3. Laying and installation schedule.
   4. Specifications, data sheets, and affidavits of compliance for protective shop coatings and linings.
   5. Manufacturer's design calculations including, but not limited to, wall thickness and deflection under specified live and dead loads.
C. Certificates and Affidavits:
   1. Submit as specified in Division 1.
   2. Furnish the following prior to shipment:
      a. Affidavit of compliance with applicable standard.
      b. Test certificates.
D. Provide Manufacturer's Certification that the material was manufactured and tested in accordance with the specifications.
E. Qualifications:

1. Furnish prior to joint fusion:
   a. Fusion technician qualifications per ASTM F3190 from the pipe supplier for the size and type of fusible pipe being installed.

1.04 QUALITY ASSURANCE:

A. Manufacturer:
   1. Experienced in the design, manufacture, and commercial supply of the specific material.
   2. Experienced in the design, manufacture, and commercial supplying of the specific size of pipe.
   3. Certify to above minimum experience requirements.

1.05 DELIVERY, STORAGE AND HANDLING:

1. Deliver, store, and handle equipment and materials as specified in Division 1 and in accordance with the pipe manufacturer's recommendations.

PART 2 - PRODUCTS

2.01 PIPE REQUIREMENTS:

A. Furnish pipe of materials, joint types, sizes, and strength classes indicated or specified. Higher strengths may be furnished at Contractor's option. Furnish maximum pipe lengths produced by the manufacturer.

B. The pipeline manufacturer shall verify and attest to the fact that their pipe is good at all depths scheduled for installation.
   a. Shop drawings and pipe wall thickness calculations certifying that pipe is good at all depths scheduled for installation shall be submitted to the Engineer for review prior to pipe installation.

C. Pipe shall be designed to withstand all stresses resulting from external loads at depths shown on the Contract Drawings and H-20 live loadings in roadways.

D. Pipe Bedding: As specified.

E. Pipe Color: Pipe interior and exterior shall be green, blue pipe is not acceptable for PVC carrying untreated water.

F. Pipe Marking:
   1. All pipe, fittings and specials shall be marked conforming to the applicable standard specification under which the pipe is manufactured and as otherwise specified.
   2. Mark field location of fittings and specials by station.

G. Pipe Gaskets: All elastomeric gaskets and seals shall be synthetic rubber.

H. Each pipe or fitting shall have plainly and permanently marked on the pipe wall the pipe class and size, date of manufacturer, manufacturer's name or trade mark, and deflection angle for bends.

2.02 DUCTILE IRON PIPE:

A. For ductile iron gravity pipe, refer to Section 33 11 00 - Pressure Pipe.

2.03 PVC GRAVITY PIPE:

A. Design of Pipe: Design shall conform to AWWA C900 and as specified:
   1. External Loading:

GRAVITY PIPING SCHEDULE				
SIZE (in)	LINE	DESCRIPTION	MATERIAL	CLASS
36	EFFL	EFFLUENT-1, EFFLUENT-2	DIP/PVC	150/SDR 26
36	EFFL	EFFLUENT-3	PVC	DR-32.5
48	INFL	INFLUENT	PVC	DR-32.5
36	SB	SCREEN BYPASS	PVC	DR-32.5

      a. Earth dead load cover at 120 pcf plus AASHTO H-20 live loads.
      b. 5% deflection limit.
      c. Bedding condition as indicated.
   2. Joints:
      a. Compression-type with the elastomeric ring gasket confined in the annular space between the bell end or socket and the spigot end of pipe.
      b. Elastomeric gasket ring joints shall conform to the requirements of ASTM D3212 or ASTM F477. Gaskets shall be neoprene or other synthetic rubber material.
      c. Must be water tight based on high head condition.
      d. Plain end of pipe shall be marked with a reference line to facilitate assembly inspections.
   3. Fittings:
      a. Fittings shall conform to AWWA C110 or AWWA C153
      b. Fittings shall be mechanical joint or push-on-type joint
      c. Fittings shall have pressure rating of not less than that specified for the pipe.
   4. Connections: Furnish any special flexible couplings required for manhole tie-ins or connections to other rigid structures.

B. Inspection and Testing:
   1. Primarily by manufacturer's testing laboratory and quality control personnel.
   2. Perform to avoid, insofar as possible, delivery of defective pipe.
   3. May be witnessed by Owner, Engineer, or approved independent testing laboratory.
      a. Independent testing laboratory, when used, shall be retained by Owner at no expense to Contractor.
      b. Contractor and manufacturer shall cooperate with Owner's inspection and test personnel. Permit unrestricted access, furnish reasonable space and facilities, and provide 5 working days advance notice of test schedule.
   4. Contractor shall provide 3 copies each of certified test reports to Engineer.
      a. Include stiffness and deflection, dimension, and hydrostatic joint tests per ASTM D3034, D3212, F679, F794, and F949.
      b. Furnish prior to delivery.

C. Handling and Delivery:
   1. Do not deliver until tests on representative specimens have been performed.
   2. Use equipment and methods adequate to preserve quality of pipe and to protect joint elements.

2.04 PVC SEWER PIPE:

A. Specified in KC Water Standard Specification Section 02624 – PVC Gravity Sewer Pipe

2.05 REINFORCED CONCRETE PIPE – STORMWATER PIPE (RCP):

A. Specified in KC Water Standard Specifications Section 02630 – Stormwater Pipe and Structures

2.06 GASKETS AND BOLTING MATERIALS:

A. Provide all gaskets, bolts, lubricant, and other accessories required to install pipe, fittings, and specials complete and ready for service.

2.07 TRACER WIRE:

A. Tracer wire shall be provided as indicated.
   1. Minimum AWG 10 solid copper
   2. 30 mils of green PE insulation

B. Tracer wire tape shall be as follows:
   1. 2-inch-wide vinyl plastic electrical tape
   2. 7 mils in thickness

C. Where connections to existing tracer wire are required or where connections to newly installed tracer wire (tees, end of rolls, etc.) are required, tracer wire shall be spliced with:
   1. DryConn Direct Bury Lug Aqua waterproof connector.
   2. Engineer Approved Equal.

2.08 WARNING TAPE:

B. Shall be at 6 inches in width.

C. Shall be green in color.

D. Shall have black lettering stating, “CAUTION BURIED SEWER BELOW.”
   1. Lettering shall be imprinted at 20 to 30-inch intervals.

PART 3 - EXECUTION

3.01 INSTALLATION - GENERAL:

A. Reference Section 33 31 50 - Pipe Installation for installation and testing procedures.

3.02 DUCTILE IRON PIPE INSTALLATION:

A. Install according to Section 33 11 00 - Pressure Pipe and Section 33 31 50 - Pipe Installation.

3.03 PVC SEWER PIPE INSTALLATION:

A. Install according to KC WATER Section 02624 – PVC Gravity Sewer Pipe

3.04 PVC PIPE INSTALLATION:

A. Install according to Section 33 31 50 - Pipe Installation.

3.05 REINFORCED CONCRETE PIPE (RCP) STORMWATER PIPE INSTALLATION:

A. Install according to KC Water Standard Specification Section 0230 – Stormwater Pipe and Structures

B. Prior to constructing new sewers, the Contractor shall physically locate all utilities within ten (10) feet of the proposed sewers. If there is a utility conflict with the proposed sewers, the Contractor shall notify the City/Design Professional and survey the existing service top

elevation and horizontal coordinates. Certified as-built redlines and the utility investigation surveying are the sole responsibility of the Contractor.

C. The Contractor is responsible for determining all conflicted crossings for the proposed storm sewer and submit their service-relocation shop drawings and/or certified sketches for the City/Design Professional's review and approval. (Contractor is also responsible for providing field electronic data such as the location coordinates and spot elevations for the City/Design Professional's use.) It shall be the responsibility of the Contractor to obtain necessary field information for aiding in determining the required minimum length of the existing sanitary or any other services necessary to clear for the construction of proposed sewers.

3.06 TRACER WIRE:

A. Install according to Section 33 31 50 - Pipe Installation.

3.07 WARNING TAPE:

A. Underground marking tape shall be installed at least 18 inches above utility.

END OF SECTION 33 33 11.

SECTION 35 20 16 – SLIDE GATES

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes slide gates, electric motor operators, manual operators, and accessories.
B. Furnish the number and type of gates and operators as specified and indicated.

1.02 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
B. Applicable Standards:
   1. American Water Works Association (AWWA):
      a. AWWA C542 - Electric Motor Actuators for Valves and Slide Gates - First Edition.
      b. AWWA C561 - Fabricated Stainless Steel Slide Gates.
   2. ASTM International (ASTM):
      a. ASTM A126 - Standard Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.
      b. ASTM A276/A276M REV A - Standard Specification for Stainless and Heat-Resisting Steel Bars and Shapes.
      c. ASTM B21/B21M - Standard Specification for Naval Brass Rod, Bar, and Shapes.
      d. ASTM B584 - Standard Specification for Copper Alloy Sand Castings for General Applications.
      e. ASTM D2000 – Standard Classification System for Rubber Products in Automotive Applications.
   3. Society for Protective Coatings (SSPC):
      a. SSPC SP5 - White Metal Blast Cleaning.

1.03 SUBMITTALS:

A. Submit as specified in Division 1.
B. Include, but not limited to, the following:
   1. Catalog data or illustrations showing principal parts and materials.
   2. Spare parts list.
   3. Assembly and disassembly or repair instructions.
   4. Detailed layout dimensions.
   5. Protective coating system.
   6. Leakage testing procedures.
   7. Electric motor operator product data.
   8. Schematic and wiring drawings.
   9. Instruction books and installation, operation, and maintenance manuals.

1.04 QUALITY ASSURANCE:

A. Manufacturers shall be experienced in the design and manufacture of Equipment and accessories.
B. Manufacturer shall have proof of design test records in accordance with AWWA on file available for submittal.
C. Manufacturer shall be experienced and in regular production of gates and water control equipment.
D. The gate shall be fully shop assembled, adjusted, inspected, and tested for operation and leakage before shipment.

1.05 DELIVERY, STORAGE, AND HANDLING:

A. Shall be as specified in Division 1.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Fabricated Slide Gates:
   1. Hydro Gate Corporation.
   2. Fontaine-Aquanox.
   3. Rodney Hunt.
   4. Waterman Industries, Inc.
   5. Whipps, Inc.
   6. Golden Harvest, Inc.

B. Slide Gate Electric Motor Operators:
   1. Auma.
   2. Limitorque Corporation.
   3. Rotork Incorporated.

2.02 FABRICATED SLIDE GATES:

A. Design:
   1. Size, seating and unseating heads, and gate centerline elevations in accordance with Table 1:
   2. Conform to applicable provisions of AWWA C561.

B. Materials:
   1. Slide, reinforcing, and frame: Stainless steel, ASTM A276/A276M REV A, Type 304.
   2. Stem: Stainless steel, ASTM A276/A276M REV A, Type 304.
   3. Seals: Neoprene, ASTM D2000, Grade 1BE625.
      a. The seal material for slide gates in the coarse screening structure (IPS-GATE- 011, IPS-GATE-012, IPS-GATE-021, IPS-GATE-022, IPS-GATE-031, IPS-GATE-032) shall be EPDM, ASTM D2000.
   4. Fasteners and anchor bolts: Stainless steel, Type 316.
   5. Actuator lift nut: Bronze, ASTM B584.
   6. Wheel or crank operator: Cast iron, ASTM A126, Class B, or aluminum.
   7. Seats: Ultra-high molecular weight (UHMW) polymer.
   8. Stem guide brackets required for slide gates in the coarse screening structure (IPS-GATE- 011, IPS-GATE-012, IPS-GATE-021, IPS-GATE-022, IPS-GATE-031, IPS-GATE-032) shall be Stainless steel, 316.
   9. Stop collar: Naval Bronze, ASTM B21/B21M, or cast aluminum.

C. Frames:
   1. Machine all surfaces forming joints or bearings.
   2. Machined from a one-piece integral casting, no bolted legs or guides permitted.
   3. Guide grooves machined on all bearings and contact faces.
   4. Guide grooves long enough to support at least one half of the slide in full open position.
   5. Capable of taking the total thrust produced by water pressure or wedging action.

D. Guides:
   1. Shall be one piece designed to withstand the total thrust due to water pressure and acting wedge action.
   2. Machine all bearing and contact surfaces.

3. Shall be of such length as to retain and support at least on half the disc in the full open position.
4. Shall be integrally cast with or attached to the frame with stainless steel studs and nuts and will be dowelled to prevent any relative motion between the guides and frame.

E. Construction
1. Integral slide, seat, and frame unit.
2. Guide extrusions shall act as guides for the slide and shall have high-density polymer seats securely fastened to the guides in contact with both the upstream and downstream.
3. Self-contained frame of sufficient strength to withstand the thrust developed.
4. Deflection of slide under full load head shall be limited to 1/360 of the span or 1/16", whichever is less. Reinforce slide with structural shapes, if required.
   a. Provide a connector welded to the slide assembly to receive the stem.
   b. Bolt stem to connector with a minimum of two bolts.
   c. Design connector pocket to take the full thrust developed during gate operation.
5. Provide solid seals anchored to each side guide and bottom sill:
   a. Type "P" and "J" or self-adjusting UHMW seat/seals.
   b. Slide shall make uniform contact with seal when it is closed without damaging seal surface.
6. Size stem to be of adequate diameter to safely withstand twice the force created by a 40-pound pull on the handwheel.
   a. Stem shall have a minimum diameter of 1 ½" and shall have machine rolled full depth ACME threads.
   b. Supported by guides spaced to provide a 1/r ratio of less than 200.
   c. Provide single stem.
   d. Provide clear butyrate plastic stem cover with Mylar tape to indicate slide "open" and "closed" positions.
      (1) Attach securely to handwheel with noncorrosive materials.
7. Anchor Bolt Assembly:
   a. Complete anchor bolt assembly (studs, nuts, washers, etc.) to be designed and provided by the manufacturer. Anchor material shall be 316 SST. Anchor size and embedment shall be clearly shown on the equipment drawings.

F. Operators:
1. Provide operator type and mounting as indicated in Table 1. Each gate shall be equipped with electric motor operator. Furnish auxiliary handwheel for manual operation of electric motor operators to open counterclockwise for each operator.
2. For floor stand mounted operators, pedestal height shall be approximately 3 feet from bottom of pedestal to centerline of driver. For operators for gates IPS-GATE-101, IPS-GATE-102, and IPS-GATE-103, pedestal height shall be such that centerline of driver is at a minimum elevation of 828.00 ft.
3. Operators to be oil filled.
4. Electric Operator:
   a. Provide A/C electric motor operators in accordance with AWWA C542 for stop-close-open service for all designated motorized gates to operate on 480V, 3-phase, 60 Hz, with position indicators.
   b. Shall be equipped with field terminals for all discrete and analog I/O as specified.
   c. Provide integral full voltage reversing magnetic starters and shall be pedestal or rack mounted. Include control power transformer sized for all control features specified.

d. Electric motor operator shall move gate from fully open to fully closed position within 15 minutes and reverse at same speed.
e. Furnish limit switches for electric motor operators mounted in the assembly containing the motor and gearing as follows:
    (1) Torque responsive limit switch:
        (a) To be operative during the entire opening and closing travel of the gate.
        (b) Of adjustable type not requiring auxiliary relays or devices.
    (2) Intermittent gear type limit switches:
        (a) Governed by rotation of the driving mechanism.
        (b) Adjustable in both the opening and closing directions.
        (c) Provided to stop gate travel in both directions and operate indicating lights.
f. Furnish enclosure, mounted on the pedestal for electric motor operators with the following:
    (1) LED or LCD graphical display, which shall show the following:
        (a) Gate position within 0.1% increments.
        (b) Alarms and warnings.
        (c) Settings menu.
        (d) Others as recommended by the manufacturer.
    (2) Push buttons marked “open”, “stop” and “close” on all operators.
    (3) “Local-Off-Remote” selector switch.
    (4) Heavy-duty, weatherproof or explosion type as indicated or specified.
    (5) Double o-ring seals to eliminate water ingress.
    (6) Strip heaters to prevent condensation.
    (7) Additional switches for remote green and red indicating lights.
g. Unless otherwise specified or indicated, provide operators with the following NEMA enclosure:
    (1) Non-classified, outdoor areas:
        (a) Weatherproof/hosedown – NEMA 4.
    (2) Classified, indoor and outdoor areas:
        (a) Explosionproof – NEMA 7.
h. Electric motor operator signals, at minimum:
    (1) Discrete outputs:
        (a) Dry contacts rated 5A, 120Vac.
        (b) Signals:
            1). Open limit switch.
            2). Closed limit switch.
            3). Common alarm.
            4). In-Remote mode.
    (2) Discrete inputs:
            1). Close.
            2). Open.
            3). Stop.
    (3) Analog output:
        (a) 4-20mA range
            1). Position feedback.
i. Totally enclosed gearing with lubrication fittings.
j. Provide pedestal shop prime coated and painted in accordance with AWWA C560.
k. Mechanical seals or grease lubrication system.

l. Self-locking at any position of the stem travel.

5. Handwheel Operator:
   a. Shall be top mounted on the head frame.
   b. Furnish grease fittings.
   c. Handwheel shall be in vertical position.
   d. Handwheel shall have a maximum required effort of 40 pounds to operate gate.
   e. Provide a solid rim handwheel with an arrow to show direction of opening. The centerline of the handwheel operator shall be approximately 36 inches above the operating floor elevation.

G. Painting:
   1. Exposed and enclosed machined or bearing surfaces shall be shop coated with manufacturer's standard water-resistant grease or rust-preventive compound before shipment.
   2. Stainless steel surfaces shall not be painted.

Notes:
(1) SO = shut off, WS = weir service.
(2) Frame type abbreviations:
FMNSC = Face-mounted, non-self contained
ESC = Embedded, self contained.
FMSC = Face mounted, self contained.
BGBS = Bevel geared, bench stand.
-WB = Wall bracket required.
(5) Gate details are based on channel dimensions needed for ultraviolet light disinfection equipment as furnished by Trojan Technologies. If another

(3) Operator type abbreviations:
CO = crank operated.
HW = Handwheel.
E = Electric.
(4) Operator mounting abbreviations:
FS = floor stand.
BGFS = Bevel geared floor stand.
YM = Yoke mounted.

manufacturer is furnished for the disinfection system, all modifications (if any) to the gate required to accommodate the equipment furnished shall be the responsibility of the Contractor.
(6) Gates to be face-mounted over pipe openings. Coordinate final dimensions based on inner diameter of pipe type for each gate.
(7) Support brackets for stem will need to be provided intermittently as determined by slide gate manufacturer.
(8) Gates to be downward opening weir gates.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Comply with provisions of AWWA C540, AWWA C562, and as specified.

B. The mechanism shall be installed in accordance with the manufacturer's recommendations as approved by the Engineer. Prior to start-up a factory trained field service engineer shall inspect the equipment, make necessary final adjustments and certify the equipment ready for operation.

3.02 MANUFACTURER'S FIELD SERVICES:

A. The equipment shall be started by a manufacturer's representative, who shall certify to the Engineer that all equipment is properly installed, and the plant operator has been instructed concerning proper operation and maintenance. Operator training shall include all items contained in the operation and maintenance manual.

B. Manufacturer's Authorized Representative: Present at work site or classroom designated by the Owner, for the minimum person-days listed below, travel time excluded.

   a. Two (2) person-days for installation assistance, inspection, training, testing and certification of installation.

C. Perform equipment tests during and after start-up to determine if equipment is performing as specified.

D. Furnish and dispose of water required for leakage tests in a manner approved by Engineer.

E. Lubricate all stem threads, bearings and gears before placing gates in operation.

F. Leakage Test: Leakage shall not exceed the limits established by AWWA C562.

   1. Contractor shall furnish bulkheads as required.
   2. Minimum seating head shall be as specified.
   3. Minimum test duration shall be two hours.

3.03 SUPPLIER'S FIELD SERVICES: Provide installation, start-up, and testing services for all Equipment as specified in Division 1.

3.04 PERFORMANCE TESTS:

A. Leakage Test: Perform field leakage test per AWWA C561 and submit certified test results per Division 1.

END OF SECTION 35 20 16

DIVISION 40 – PROCESS INTEGRATION

SECTION 40 60 00 – PROCESS CONTROLS AND INSTRUMENTATION – GENERAL REQUIREMENTS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:
- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:
- A. This Division includes instruments, control devices, control panels, computer hardware and system programming as specified in Sections 40 60 00 – 40 70 00.
- B. Related Work Specified Elsewhere:
  1. Interconnections and control of equipment: All applicable Divisions.

1.03 RELATED REQUIREMENTS:
- A. Division 26: All applicable Sections.

1.04 REFERENCE STANDARDS:
- A. National Fire Protection Association (NFPA):
  1. NFPA 70 – National Electrical Code (NEC).
- B. Other standards as specified in applicable Sections.

1.05 SUBMITTALS:
- A. Submit as specified in Division 01.
- B. Manufacturer with prime responsibility shall assume responsibility for all Compliance Submittals.
- C. Qualifications Submittal:
  1. Submit SI qualifications package with experience, resumes, and certifications for each member of the SI team responsible for the project.
- D. Additional submittals as specified in each applicable Section, this Division.

1.06 QUALITY ASSURANCE:
- A. General:
  1. The Contractor shall provide the services of a single pre-qualified System Integrator (SI), to provide the material, equipment, labor, and services specified in Sections 40 60 00 – 40 70 00. The SI shall be subcontracted and under the direct supervision of the Contractor.
- B. Acceptable System Integrators (SI):
  1. The communication, instrument and control systems may use Equipment of different manufacturers, but the System Integrator Subcontractor shall assume prime responsibility for the complete instrumentation and control system.
  2. No Bidder shall be required to employ any Subcontractor, other person, or organization against whom Bidder has reasonable objection.
  3. The SI shall be one of the following prequalified companies:
     a. R.E. Pedrotti Company, Inc
        (1) 5855 Beverly Ave, Suite A, Mission, KS 66202. Ph: 913.677.3366.
     b. Integrated Controls, Inc.

(1) 15707 Mahaffie St., Olathe, KS 66062. Ph: 913.782.9600.

c. Durkin, Inc.

(1) 2383 Chaffee Dr., St. Louis, MO 63146. Ph: 314.432.2040.

4. If Contractor wishes to utilize a System Integrator not listed, it shall submit qualification documentation for review and approval demonstrating the experience requirements of this article a minimum of two weeks prior to bid opening. As a minimum the following information shall be submitted:
   a. Evidence of sufficient financial resources to perform the required work. This evidence may be in the form of a certified financial report for the latest fiscal year.
   b. Verification of all items listed under the system integrator qualifications paragraph.
   c. Name the key project staff who will be responsible for office engineering and project management; software configuration; field testing, calibration and start-up; and operator instruction and maintenance training. Include an organization chart of key project staff and detail availability of each staff assigned.
   d. Provide resumes of proposed key project staff that demonstrate project experience with the control system products specified for the project.
   e. Provide references for at least five (5) projects where the following tasks were performed by personnel directly employed by the firm as a SI; system engineering and documentation including panel assembly, schematics, and wiring diagrams; software configuration and documentation; field testing, calibration, and start-up; and operating instructions and maintenance training. Project references shall include contact information for owners and consulting engineers.

C. System Integrator Qualifications:
   1. The instrumentation, control and communications system shall be furnished by a System Integrator (SI) who shall assume responsibility for the satisfactory performance of the entire plant control system. Only those SI who can demonstrate that they possess the prerequisite capabilities and experience shall be considered. The System Integrator subcontractor must meet the following minimum criteria:
      a. The SI Company shall have been in business performing SI work on water and wastewater treatment projects, and have control systems technicians with experience with installation, testing, calibrating and startup of industrial control and automation systems.
      b. The SI Company shall demonstrate the number of competent and experienced office staffing, field technicians, and service personnel are available to support this project.
      c. The SI Company shall have specific training and experience with the following:
         (1) Rockwell PlantPAx, FactoryTalk View SE, and associated system architecture.
         (2) Allen-Bradley ControlLogix and CompactLogix Programmable Automation Controllers and associated RSLogix 5000 programming software.
         (3) Ethernet network setup and configuration including managed switch configuration.
         (4) Instrumentation setup and calibration.
      d. The SI shall hold current certifications for the Rockwell software and hardware specified herein. Additional certifications for industrial and enterprise networks as specified in Section 40 66 00 – Process Control Networks.
      e. The SI shall be capable of providing control panels produced in a UL 508 authorized manufacturing facility and listed accordingly.

1.07 SEQUENCING AND SCHEDULING:

A. Coordinate the installation of Equipment and Materials specified in this Division with construction schedule.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Products as specified in Sections 40 60 00 – 40 70 00.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment and systems specified in this Division.

3.02 INSTALLATION:

A. System Integrator shall be responsible for all cabling terminations at instruments, control panels and devices supplied by the System Integrator.
B. Refer to Section 26 05 19 – Low Voltage Cable for additional cable termination requirements.

3.03 FIELD QUALITY CONTROL:

A. Manufacturer's field services:
   1. As specified in each applicable Section, this Division.
B. Field Testing:
   1. General Requirements:
      a. Conform to requirements as specified in Division 01.
      b. Conduct all tests in the presence of Engineer under the supervision of Equipment manufacturer's field engineer.
      c. Notify Engineer two weeks prior to the commencement of all tests.
      d. Include all tests recommended by the Equipment manufacturer unless specifically waived by Engineer.
      e. Include all additional tests recommended by Engineer that he deems necessary because of field conditions, to determine that Equipment and Materials and systems meet requirements of Contract Documents.
      f. Be responsible for all damage to Equipment and Materials due to improper test procedures or test apparatus handling.
   2. Test Reports:
      a. Submit test reports as specified in Division 01.
      b. Maintain a written record of all tests showing date, personnel making tests, equipment or material tested, tests performed, and results.

3.04 TRAINING:

A. The System Integrator shall provide formal training for operators, maintenance, and service personnel.
B. A training schedule and log shall be developed. The training schedule shall identify scheduled dates and times for all training sessions specified in this Division. The training log shall identify dates for training and record training session attendees.

C. Training sessions shall be scheduled with the Owner a minimum of two weeks prior to occurrence and a training schedule shall be maintained and communicated to the Owner on a routine basis.
D. Contractor shall make digital video recordings of all on-Site training for training purposes. Any charges for this video recording shall be included.
E. Provide training as specified in each applicable Section, this Division.

END OF SECTION 40 60 00

SECTION 40 61 96 – PROCESS CONTROL SOFTWARE PROGRAMMING AND REPORTS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes control descriptions and requirements for Programmable Logic Controllers (PLCs) and the Plant Control System (PCS) software programming.
B. The Systems Integrator shall be responsible for all PLC and PCS programming.
C. PLCs and Human Machine Interface (HMI) touchscreens associated and supplied with the process equipment skids shall be programed by the equipment supplier. Equipment supplier shall conform to HMI standards as defined herein.
D. Related Work Specified Elsewhere:
   1. All applicable Divisions.

1.03 RELATED REQUIREMENTS:

A. Section 40 60 00 – Process Control and instrumentation General Requirements
B. Section 40 66 00 – Network and Communications Equipment.
C. Section 40 67 00 – Process Control Panels and Hardware.
D. Section 40 70 00 – Instrumentation for Process Systems.

1.04 REFERENCE STANDARDS:

A. International Society of Automation (ISA).
   1. 101.01 – Human Machine Interfaces for Process Automation Systems.
B. Kansas City MO Water Services.
   1. Wastewater SCADA System Software Standards and Conventions.

1.05 SUBMITTALS:

A. Submit as specified in Division 01.
B. Manufacturer with prime responsibility shall assume responsibility for all Compliance Submittals.
C. Product Data: Submit for each type of product specified and included the following as minimum:
   1. A complete listing of all proposed HMI screens and the corresponding points and parameters that will be displayed on each screen.
   2. Proposed standard HMI and PLC objects for the project (i.e. pump control, valve control, etc.). Inputs and outputs that will be developed for each object shall be identified.
   3. Complete list of network connected devices requiring IP Address assignments.
D. Special Procedure Submittals:
   1. Power Failure and Restoration:
      a. Provide a complete description of the power failure and restoration mode programming.
   2. Test Plan:
      a. Provide a complete and detailed testing plan for the control system.
      b. Provide procedures and forms for the following:
         (1) Factory acceptance test (FAT)
         (2) Site acceptance test (SAT)
   3. Syllabus for Owner training.

E. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Provide O&M manuals in electronic and hardcopy format including as a minimum the above information and the following:
   2. Soft copies of complete PLC program including all program comments.
   3. Soft copies of all final HMI screens and applications.

F. Maintenance Material Submittals:
   1. Software:
      a. Assemble and submit all software and program copies.
   2. Organize, label, and submit on flash media or solid-state drive.

1.06 QUALITY ASSURANCE:

A. Programmer Qualifications:
   1. Programming shall be by a Systems Integrator specializing in plant control system integration for the water/wastewater industry.
   2. The Programmer shall be trained on the software specified for this project including, but not limited to: Rockwell Automation PlantPAx and FactoryTalk applications, RSLogix applications, RSLinx, ACP Thinmanager, and other applicable software packages.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Products as specified in Division 40.

PART 3 - EXECUTION

3.01 GENERAL:

A. The intent of the control system specified and indicated is to provide complete control and monitoring capabilities for the Todd Creek Wastewater Treatment Plant Expansion.
B. The PLCs and other associated networked equipment shall be programmed to communicate the required data to the associated PlantPAx servers via EtherNet/IP protocols.
C. The control system shall be connected to KC Water's SCADA fiber network as indicated to provide remote monitoring and control capabilities. Connection details of this fiber network shall be coordinated with KC Water.
D. Operator Workstation screens shall be developed for control interface and monitoring of the systems described.
E. All set points and time delays described in the sequence of operation are initial values and shall be adjustable by users with the appropriate user security group at the associated Operator Workstation screens.
F. The Systems Integrator shall coordinate with equipment manufacturers for communication of specified points between the PCS and the manufacturer supplied PLC's. Operator workstation screens shall be developed to display status and provide control interfaces for the manufacturer supplied equipment as specified.
G. Coordination with AGS System Supplier:
   1. The HMI screens associated with the AGS system shall be developed by the AGS System supplier.
   2. The Systems Integrator shall be responsible for coordinating with the AGS System supplier to establish HMI development standards to ensure the HMI screens developed by

the AGS supplier and the Systems Integrator share the same typical graphics, faceplates, and function blocks to meet the project standards.

3. The Systems Integrator and AGS supplier shall work together to ensure required control and monitoring signals are communicated correctly between the AGS PLC and the plant PLCs.
4. The AGS system "Nereda Controller" shall be supplied by the AGS System Supplier in the form of a rack mounted host server. The server shall be installed and connected to the network by the SI. The AGS supplier shall be responsible for programming and configuration of the server. Coordination shall be provided for this work as required.
5. The Systems Integrator shall work with the AGS system supplier to establish communication with the aeration drive VFDs.
6. As a minimum the AGS system supplier and Systems Integrator shall participate in three web conferences setup by the Systems Integrator and attended by the Engineer to determine programming standards, verify proper application of the standards and coordinate communicated signals.
    a. The first web conference shall occur a minimum of one month prior to the Systems Integrator or AGS system supplier starting system development and shall serve to discuss development standards and develop an action item list for information needed to properly develop the systems.
    b. The second web conference shall occur one week prior to the AGS system supplier starting system development and shall serve as the meeting to communicate development standards to all parties.
    c. The third web conference shall occur after the oxidation system supplier has completed their initial screen development and PLC program and shall serve as a review meeting to verify that proper standards have been followed and proper points are being communicated.
    d. Follow up conferences shall occur as required during development and after initial development is completed to ensure the agreed to standards are being followed, discuss progress, verify communicated points and address any outstanding communication questions.

3.02 HARDWARE AND SOFTWARE CONFIGURATION:

A. A fault tolerant server (ftServer) with hardware redundancy shall be rack mounted and configured as a redundant system. The Process Automation System Server(s) (PASS) shall be virtualized to provide the necessary software configuration for redundancy and instant failover capability. The PASS servers shall communicate with the plant PLCs on the network as necessary.
    1. If the primary server failure occurs, the secondary server shall automatically assume the roles performed by the primary server until the primary server can be brought back online. Procedures for identifying and transitioning between primary and secondary servers shall be described by the SI in the submitted O&M manual.
    2. If the primary or secondary server fails, the operator shall be alarmed.
B. The desktop mounted operator workstation clients and panel mounted clients indicated shall be configured as industrial thin clients. The system shall utilize Thin Manager Server to provide I/O data to the thin clients. The Thin Manger servers shall be configured as redundant on the system.
C. A FactoryTalk Historian server shall be provided and implemented for the system.
D. Additional servers shall be as specified this section.

E. The host server shall be configured with a minimum of 10 virtual machines (VMs) and configured with the software and dedicated hardware resources as listed below. The provided configuration is recommended based on Owner's standards. Coordinate with the Owner's latest standard VM configurations for final VM builds and associated licensing:
   1. Virtual Machine No. 1 (VM1, HOST 1):
      a. Shall be configured as the primary HMI I/O Server with Data Center and Historian Data Interface.
      b. OS: Windows Server 2019.
         (1) Computer Name: WW715-PASS01.
         (2) Domain: kcwtc.loc.
      c. Hardware Configuration:
         (1) CPU: 4-Core.
         (2) Memory: 16 GB.
         (3) Storage: 100 GB.
      d. Software Load:
         (1) FTView SE 12.0.
            (a) Unlimited display.
            (b) 10 client licenses.
         (2) FTView Historian Data Link.
         (3) FTView Historian Live Data Interface.
         (4) PI Interface Configuration for redundancy to Historian Server with buffering.
         (5) FTView Activation Manager.
         (6) Microsoft Office 2019.
         (7) Adobe Reader.
         (8) Install all the latest patch rollouts.
   2. Virtual Machine No. 2 (VM2, HOST 2):
      a. Shall be configured as the secondary HMI I/O Server with Data Center and Historian Data Interface.
      b. OS: Windows Server 2019.
         (1) Computer Name: WW715-PASS02.
         (2) Domain: kcwtc.loc.
      c. Hardware Configuration:
         (1) CPU: 4-Core.
         (2) Memory: 16 GB.
         (3) Storage: 100 GB.
      d. Software Load:
         (1) FTView SE 12.0.
            (a) Unlimited display.
            (b) 10 client licenses.
         (2) FTView Historian Data Link.
         (3) FTView Historian Live Data Interface.
         (4) PI Interface Configuration for redundancy to Historian Server with buffering.
         (5) FTView Activation Manager.
         (6) Microsoft Office 2019.
         (7) Adobe Reader.
         (8) Install all the latest patch rollouts.
   3. Virtual Machine No. 3 (VM3, HOST 1):
      a. Shall be configured as the Historian Server.

b. OS: Windows Server 2019.
   (1) Computer Name: WW715-APP01.
c. Hardware Configuration:
   (1) CPU: 4-Core.
   (2) Memory: 16 GB.
   (3) Storage: 700 GB.
d. Software Load:
   (1) FT Historian SE 7.0.
      (a) 2,500 Tag Count.
   (2) Microsoft Office 2019.
   (3) Adobe Reader.

4. Virtual Machine No. 4 (VM4, HOST 1):
   a. Shall be configured as the SQL Data Server.
   b. OS: Windows Server 2019.
      (1) Computer Name: WW715-SQL01.
   c. Hardware Configuration:
      (1) CPU: 4-Core.
      (2) Memory: 24 GB.
      (3) Storage: 700 GB.
   d. Software Load:
      (1) MS SQL Server 2019 (64bit) Full Version.
      (2) Historian Asset Framework.
      (3) Microsoft Office 2019.
      (4) Adobe Reader.
5. Virtual Machine No. 5 (VM5, HOST 1):
   a. Shall be configured as the local Domain Controller.
   b. OS: Windows Server 2019.
      (1) Computer Name: WW715-DC01.
      (2) Root Domain Name: kcwtc.loc.
   c. Hardware Configuration:
      (1) CPU: 4-Core.
      (2) Memory: 12 GB.
      (3) Storage: 80 GB.
   d. Software Load:
      (1) Adobe Reader.
      (2) Coordinate with KC Water IT for configuration of Active Directory.
         (a) Sync to existing Active Directory at Blue River WWTP.
6. Virtual Machine No. 6 (VM6, HOST 1):
   a. Shall be configured as the Factory Talk Directory and Activation Server for PlantPax.
   b. OS: Windows Server 2019.
      (1) Computer Name: WW715-FTD01.
   c. Hardware Configuration:
      (1) CPU: 4-Core.
      (2) Memory: 12 GB.
      (3) Storage: 80 GB.
   d. Software Load:
      (1) FTView Service Platform.

(2) FTView Activation Manager.
(3) Adobe Reader.

7. Virtual Machine No. 8 (VM8, HOST 1):
   a. Shall be configured as the primary Thin Manager Server.
      (1) Redundant ThinManager Rockwell License
      (2) Configure for Instant Failover.
   b. OS: Windows Server 2019.
      (1) Computer Name: WW715-TM01.
   c. Hardware Configuration:
      (1) CPU: 6-Core.
      (2) Memory: 24 GB.
      (3) Storage: 80 GB.
   d. Software Load:
      (1) Thin Manager 13.0.
      (2) FTView SE Client 12.0
      (3) Microsoft Office 2019.
      (4) Adobe Reader.
8. Virtual Machine No. 9 (VM9, HOST 2):
   a. Shall be configured as the primary Thin Manager Server.
      (1) Redundant ThinManager Rockwell License
      (2) Configure for Instant Failover.
   b. OS: Windows Server 2019.
      (1) Computer Name: WW715-TM02.
   c. Hardware Configuration:
      (1) CPU: 6-Core.
      (2) Memory: 24 GB.
      (3) Storage: 80 GB.
   d. Software Load:
      (1) Thin Manager 13.0.
      (2) FTView SE Client 12.0
      (3) Microsoft Office 2019.
      (4) Adobe Reader.
9. Virtual Machine No. 10 (VM10, HOST 1):
   a. Shall be configured as the Windows OS/RDS Licensing Server.
      (1) Quantity of 10 RDS licenses per each ThinManager server (20 total for redundant configuration).
   b. OS: Windows Server 2019.
      (1) Computer Name: WW715-LIC01.
   c. Hardware Configuration:
      (1) CPU: 4-Core.
      (2) Memory: 12 GB.
      (3) Storage: 80 GB.
   d. Software Load:
      (1) Adobe Reader.
10. Virtual Machine No. 11 (VM11, HOST 1):
   a. Shall be configured as the Engineering Workstation Server.
   b. OS: Windows Server 2019.
      (1) Computer Name: WW715-EWS01.

c. Hardware Configuration:
   (1) CPU: 4-Core.
   (2) Memory: 24 GB.
   (3) Storage: 100 GB.
d. Software Load:
   (1) FTView SE Studio 12.0
   (2) RSLogix5000/Studio5000 v.21-33.
   (3) DriveExecutive.
   (4) RSLinx Classec (ETH-1 Driver only).
   (5) FTView SE Client 12.0
   (6) Microsoft Office 2019.
   (7) PI Excel add-on.
      (a) PI to interface with Historian.
   (8) Adobe Reader.

3.03 HMI STANDARDS AND SCREEN DEVELOPMENT:

A. General:
1. HMI screens shall be developed for control interface and monitoring of systems and facilities and related equipment.
2. Where possible, standard objects shall be developed and utilized throughout the project. Objects shall be developed for flexibility with nested blocks within blocks where necessary and with the worst-case scenario in mind to allow blocks to be adaptable throughout the project. Proposed blocks shall be submitted as specified.
3. All screens shall be developed using graphics and icons from the PlantPAx library when possible. The graphic displays shall be developed using design elements and concepts intended to enhance the operator's "Situational Awareness". The development, design, and implementation of the system displays shall comply with ISA 101.01 – Human Machine Interfaces for Process Automation Systems.
4. HMI screens shall be developed based upon a 1920x1080 (16:9) ratio and shall allow for multi-monitor display.
5. All HMI screens shall be developed with input from the Owner and Engineer and all screens shall be approved by the Owner prior to startup of the system.
   a. The Systems Integrator shall schedule necessary meetings with the Owner and Engineer to properly coordinate screen development standards, layout, and other required work to ensure the developed screens and systems best meet the needs and desires of the Owner for operating the facility.
6. All analog values shall be trended and recorded in the historical database.
7. Low, low-low, high and high-high and loss of signal alarm points shall be programmed and available to set for all analog points. The operators shall be able to set values for or disable the alarm points from the HMI screens. If alarm range settings are not provided the alarm settings shall be adjustable over the entire range of the associated analog value.
8. A minimum of one decimal point of accuracy shall be provided for all analog points displayed on the HMI. Additional decimal places shall be provided where applicable.
9. All automatic control such as start/stop, speed control, flow control, and similar shall be programmed into the nearest local PLC processor. All manual controls such as start/stop, open/close, speed control, etc. shall be incorporated into the PLC programming and screens as described this section. All control shall take place in the PLC with the

applicable computer servers, workstations, and HMI screens maintained for operator interface only.

10. Provide run time totalization for all equipment in the nearest local PLC processor and display the current value on the relevant screen(s).

B. Security Access Groups:
   1. Security access groups and their assigned permissions shall match those defined by KC Water SCADA System Software Standards and Conventions and consist of the following security groups:
      a. Operators, Operating Supervisor, Maintenance, Maintenance Supervisor, Engineering, and Administrator.

C. Display Hierarchy:
   1. HMI screens shall be organized in a hierarchical manner and designed to allow efficient movement between each of the levels within the hierarchy. Each screen shall also implement relational links between nodes of a specific process when applicable, e.g. through process piping or flow interconnections. The relational links should allow the user to navigate the various screens by following the process flow stream.
   2. The display hierarchy levels shall comply with the following table:

Display Level	Display Type	Description
1	Facility Overview	Provides an overview for the entire facility geographically and/or in process flow diagram format. Identifies major valves, abnormal status, and key process parameters for the facility.
	Alarm Summary	Identifies all top priority alarms, alarm history, and acknowledged status.
	Historical Trends	Displays of embedded or full-screen trends.
2	Process Displays	Designed to be the primary operating display for normal operation and monitoring of a specific process. Includes equipment, associated status, alarm, and instrumentation.
3	System or Subsystem Detail Displays	Displays interfaces necessary for equipment control, indicators, switching, and setpoint adjustment (when applicable). Includes all associated status and alarm conditions for the equipment providing sufficient information for process diagnostics.
4	Diagnostic and Informational Displays	Provides operational procedures and/or help information such as interlocks and permissive information. Not intended for process or system control. Generally displayed in the form of faceplates or popups.

D. Display Presentation and Content:
   1. The presentation for each screen shall be designed to maximize the user's ability to navigate, enter data, and monitor the associated information.
   2. Displays shall include global navigation with all pull down menus, pop-up windows, buttons, etc. following a standard template for the project.

3. The displays shall always include navigation across the bottom of the screen and the display title information centered at the top.
4. The graphic displays shall generally follow the process flow from left to right. If specific types of screens benefit from a geographical layout (e.g. overview screens), exceptions shall be reviewed and approved by the Owner and Engineer.
5. The Systems Integrator shall establish the philosophy of each screen layout and review with the Owner and Engineer during the preliminary screen development phase.
6. The display graphics presented shall represent all major pieces of equipment including vessels, pumps/motors, piping, valves, gates etc. Any equipment that can be controlled by the system shall be represented on the HMI screens.
7. Equipment not automatically controlled, such as manual gates and valves, should be minimally shown. These elements shall only be shown when provided for informational guidance for the operator to assist in equipment selections and modes of operation.
8. Equipment shall have the written description and equipment tag displayed above the associated graphic.
9. Vessels and similar tankage should be depicted in similar shape to their actual physical shape. Shapes should typically be two-dimensional, keeping details to a minimum. Size should reflect importance and/or be representative of the vessel physical size in relationship to other vessels shown within the display. Dynamic elements should be located within the vessel shapes such as bar graphs and/or embedded trends when process variables such as level, flow, or similar is being monitored for the associated vessel.
10. Protocol shall be established which animates alarms prior to being acknowledged and maintains alarm display until the alarm condition is removed or the alarm is inhibited. Alarms, alarm acknowledgement, and inhibits shall be recorded to an event log.
    a. Screens shall be developed to allow an operator with the appropriate access level to inhibit alarm points.

E. Display Elements and Color Conventions:
1. Colors shall be used to enhance the user's ability to recognize the importance of key information such as alarms and other abnormal conditions.
2. Color selection shall be used to distinguish the type of information being displayed with higher priority information being emphasized using the most noticeable colors.
3. Color shall be used conservatively and consistently throughout the displays.
4. Colors used for alarms shall not be used for any other purpose to ensure their meaning is strengthened.
5. Colors shall be based on the PlantPAx library. Color usage, color name and color RGB definitions can be found in KC Water's SCADA System Software Standards and Conventions.
6. Static Display Elements:
    a. Static display elements and process flow streams shall conform to the table below.

Static Elements	Color
Graphic Display Background	Light Gray
Static Text: Display Titles Equipment Identifiers Equipment Symbol Outlines	Black and Dark Gray

Static Elements	Color
Static Equipment Symbols: Isolation Valves Flow Meters Similar Devices Process Symbol Outlines	Dark Gray
Static Process Symbols: Basins Filters Vessels	Gray
Primary/Major Process Flow Streams:	Dark Gray
Secondary/Minor Process Flow Streams:	Dark Gray
Chemical Feed Systems:	Gray
Compressed Air, Instrument Air	Gray

7. Lines and Arrows:
   a. Lines and arrows used for the primary process flow shall be easily distinguished from building and equipment lines or secondary flows and instrumentation.
   b. Process lines shall be shown as solid 2D graphic line with the color black.
   c. Line crossings shall give precedent to the primary process flow with the secondary lines being split.
   d. Each process flow line shall be labeled at the entrance and exit of each display and identify flow direction.
   e. When the flow line continues to another display, the entrance and exit of each flow line shall include a link to the next display associated with the flow.
   f. Arrows used for links shall be distinguished in appears from non-linked arrows.
   g. Line weights and patterns shall be as follows:
      (1) Primary Process Flow: Line width of 2, black.
      (2) Structure Lines: Line width of 1, dark gray.
8. Dynamic Display Elements:
   a. Dynamic symbol and text elements, both discrete and analog, shall conform to the requirement as specified below.
   b. Color for dynamic elements shall be used for process variables, warning, and alarm conditions. Colors shall be used to represent the priority of the associated condition, e.g. low, high, critical, etc.
   c. The dynamic elements used shall place emphasis and promote situational awareness for the operator.
   d. Equipment modes shall indicate whether the equipment is in local, off, or remote.
   e. Equipment status shall indicate running and stopped, open and closed, etc.
   f. The quality of the signal shall be represented to indicate out-of-service, inhibited alarm, bad data or communication failure.
   g. Symbols shall be emphasized using a separate colorized flashing box around the object to indicate unacknowledged alarms, signals out of range, and those not having proper communication. If the specific project implementation requires more

than two priorities (warning and alarm), the flashing box shall also include a priority identification symbol attached to the box.

9. Control Function Interfaces:
   a. Control functions requiring operator interaction or input such as hand-off-auto selection, mode selection, setpoint input, and similar shall be presented in a control panel pane integrated into the associated display windows when possible. A pop-up window or side panel shall be used if space is limited on the equipment display. The appearance of the operator interfaces shall be consistent in either presentation.
   b. PID tuning parameters and other setpoints shall be made available through this control panel interface when applicable. If the security access level is not sufficient, the parameters shall be hidden or made unavailable for user interaction.
   c. Buttons and setpoint entry fields used for process control shall be designed with a raised appearance or perceived depth to allow immediate recognition of its function by the Operator.
   d. Setpoint entry fields shall be clearly labeled with the appropriate units displayed.
   e. Navigational buttons should be distinct from buttons used for process control.
   f. Button colors and data field colors shall be as identified by KC Water's SCADA System Software Standards and Conventions.
10. Dynamic Text and Bar Graphs:
   a. Dynamic text shall be used to represent a discrete or analog signal on the operator HMI.
      (1) Dynamic text elements shall be colorized to distinguish them from static text, in addition to flashing boxes used for identifying warning and alarm conditions.
   b. Bar graphs may be utilized in addition to dynamic text elements to represent process variables.
      (1) Bar graphs may be used for process variables such as level, speed, and other analog instrumentation.
      (2) The bar graph shall be segmented to identify the variable setpoint, warning and alarm ranges in addition to the current value.
      (3) Bar graphs shall not change color or flash to represent a warning or alarm condition. Like other dynamic elements, a colored box around the associated bar shall be used for this purpose.
   c. Color conventions for dynamic text and bar graph elements shall be as identified in KC Water's SCADA System Software Standards and Conventions.
11. Display Text:
   a. Both dynamic and static text elements shall be consistent for all displays.
   b. Refer to KC Water's SCADA System Software Standards and Conventions for font style and colors.
   c. Labels and other static text element colors not defined shall utilize shades of dark gray and black to sufficiently contrast against the light gray background.
12. Alarm Text:
   a. In addition to the warning and alarm condition box animations defined in previous sections, alarms shall be displayed in text form in the alarm window. The alarm

display text colors conventions shall be as defined in KC Water's SCADA System Software Standards and Conventions.

F. Screen Development: As a minimum the following screens shall be developed for the project:
   1. System Overview Screen (Level 1):
      a. Diagrammatic Overview: Diagrammatically indicates the complete Wastewater Treatment Plant including all major structures, pump stations, storage basins, and major interconnecting piping.
      b. Dashboard Overview: Consist of a dashboard style layout for each structure with specific plant Key Point Indicators (KPIs) visible. Final screen style shall be based on Owner preferences.
      c. Displays for this screen shall at a minimum include the status of each facility, influent and effluent flow rates, and daily flow totals for the plant.
      d. Allow the operator to point and click to open a detailed screen for the associated system or structure.
   2. Detailed System Screens (Level 2):
      a. A detailed screen shall be developed for each process system.
      b. The detailed screens shall display all monitored parameters and allow for the adjustment of the control and alarm associated with the system.
      c. If a particular system requires additional screens to clearly identify and display all control and status points for the system equipment, the Detailed Screen and Overview Screen shall include links to the additional subsystem screens.
      d. Links shall be established between related screens and between each screen and the system overview screen. Relational links shall also be provided for process piping continuations between screens.
      e. A detailed screen shall be developed for each system including, but not limited to, the following:
         (1) Existing Screens and Diversion Boxes.
         (2) Influent Pump Station.
         (3) Influent Screens.
         (4) Grit Removal System.
         (5) AGS Basins (Typical of 4).
         (6) AGS Sludge Buffer Tanks and Pumping System.
         (7) AGS Water Level Correction.
         (8) Aeration Blowers.
         (9) Chemical Feed Systems.
            (a) Supplemental BOD (Carbon).
            (b) Aluminum Sulfate (Alum).
         (10) UV Disinfection System and Effluent Flow.
         (11) Process Water Pump Station.
         (12) Solids Handling Overview.
         (13) Thin Sludge Storage and Pumping.
            (a) Thin Sludge Blowers.
         (14) Sludge Thickening and Pumping.
            (a) Polymer Feed System.
         (15) Thickened Sludge Holding and Loadout Pumping.
         (16) Thickened Sludge Mixing.
         (17) Plant Sewer Pump Station.
         (18) Odor Control System.

3. Building and Structure Screens:
   a. A detailed screen shall be developed for each building or structure.
   b. The detailed screens shall display all monitored parameters including electrical and mechanical systems and allow for the adjustment of alarm points associated with the building or structure.
   c. If a particular building or structure requires multiple screens to clearly indicate the associated control and status points an overview screen shall be developed which indicates the general status of the components. The overview screen shall provide links to the associated detailed screens.
4. Electrical System Screen:
   a. Shall include a graphical depiction of the electrical one-line diagram for the plant.
   b. Shall provide display panels for monitored breaker status, bus Voltage, Amps, Watts, and Vars as applicable for each monitored circuit.
   c. Shall include the main switchboards, MCCs, and utility auto-throwover system.
   d. Provide the following screens as minimum:
      (1) Main Switchboard Auto-Throwover System (Typical of 3).
      (2) General Mechanical, Electrical, UPS, and power monitoring.
5. Communications Status Screen:
   a. Shall graphically depict the entire Ethernet network showing all PLC's, Switchboards, MCC's, network switches, graphic terminals, servers, and PC workstations in the system.
   b. Shall indicate communication system status for all switches, PLC's, and other networked equipment.
   c. Shall indicate UPS and power supply status points.
   d. Shall provide links to embedded web pages associated with each intelligent device on the network including but not limited to PLCs, power monitors, VFDs, intelligent overload relays, network switches, and UPSs. Required web browser program shall be launched when links are activated.
6. Alarm and Event Management Screens:
   a. Shall display alarms and events.
   b. Shall list the discrete alarm points and allow the operator to inhibit the alarm and select whether the alarm point causes the audible alarm to sound.
   c. Shall allow the operator to set the parameters associated with the audible alarms.
   d. Shall allow the operator to place the associated equipment alarms into "Out Of Service" mode to prevent out of service equipment from triggering alarms.
   e. Color schemes and display properties shall be as defined by KC Water SCADA Software Standards and Conventions.
7. Event Notification:
   a. The following methods shall be used for notification of alarms:
      (1) Alarm screens and alarm box animations for each process variable displayed.
8. Maintenance Screens:
   a. Maintenance screens shall be developed for each system and associated equipment.
   b. The maintenance screens shall provide links to electronic O&M materials and As-Built drawings stored in PDF format for the associated treatment plant systems and equipment.
   c. The PDF's shall be supplied as part of the manufacturers O&M material and final documentation. The systems integrator shall assemble all of the electronic documents in a common area on the control system server.

d. Specific portions of the electronic documents to be accessed more frequently should be pulled from the full O&M documents and stored as separate PDF files for quicker access. The specific portions to be separately stored shall include, but not be limited to, to following items:
   (1) Wiring diagrams.
   (2) Pump Curves.
   (3) Manufacturer's recommended maintenance schedules.
   (4) Other items as requested by the Owner.

e. As-Built drawing PDF's shall be supplied by the Engineer after the plant construction is completed. The Systems Integrator shall utilize the "For Construction" drawing PDF's for the initial development. After the As-Built PDF's are supplied the systems integrator shall replace the contract drawing PDF files with the final As-Built files.

3.04 REPORTS:

A. Reports shall be developed with input from the Owner for specific formatting and data presented.

B. Reports shall be designed in a professional manner with Titles, Headings, Dates, and other relevant information, which describe in detail the reported information.

C. Reports shall be developed utilizing XL Reporter, Ocean Data Systems Dream Reports, Microsoft Excel, or equivalent as required by the Owner's reporting standards. Coordinate with the Owner's existing reporting standards as required.

D. As a minimum the following reports shall be developed for each plant:
   1. Daily Flow Report shall include the following for all flow meters:
      a. Daily Minimum Flows.
      b. Daily Maximum Flows.
      c. Daily Average Flows.
      d. Daily Flow Totals.
   2. Daily Chemical Usage Report shall include the following:
      a. Pounds per day usage for each chemical used.
   3. Monthly Flow Report shall include the following for the influent, effluent, WAS, RAS, and other metered flows:
      a. Daily Flow Totals.
      b. Monthly Flow Totals.
      c. Daily flow rate minimum and maximum.
      d. Monthly flow rate minimum and maximum.
   4. Monthly Chemical Usage Report shall include the following:
      a. Pounds per day usage for each chemical.
      b. Monthly total usage for each chemical.
   5. Yearly Flow Report shall include the following for the influent, effluent, WAS, RAS, and other metered flows:
      a. Monthly Flow Totals.
      b. Yearly Flow Totals.
      c. Monthly flow rate minimum and maximum.
      d. Yearly flow rate minimum and maximum.
   6. The Monthly Runtime Report shall include monthly run times for all monitored equipment.

7. The Yearly Runtime Report shall include monthly and yearly run times for all monitored equipment.
8. Operator initiated report listing all operator adjustable set points. The report shall include both control and alarm values with headings indicating associated equipment.
9. Reporting information as required by Owner.
    a. Assume a minimum of five (5) additional reports to be developed based upon input from Owner.
    b. Report formatting and style shall be coordinated with the Owner and Engineer during development. The final reports shall be submitted for review and approval by the Owner and Engineer.

E. Reports shall be generated automatically on the defined periodic basis and saved in Excel format to a common directory on the server or NAS device. The operator shall be able to initiate a report to generate at any time by manually initiating the particular report. File naming convention shall be intuitive and define the report name, date, and applicable saved data.

3.05 NETWORK CONFIGURATION:

A. The plant control system Ethernet network shall be configured as specified in Section 40 66 00 – Network and Communications Equipment and as indicated on the Contract Drawings.
B. The Systems Integrator shall be responsible for programming and verifying the IP Addresses, Subnet, and Default Gateways, when applicable, for all devices on the network.
C. Coordinate IP Addressing standards with the Owner's IT Department.
D. Final IP Address scheme shall be submitted to Owner and Engineer for review.
E. VLANs shall be established for the plant network to divide the physical network into specific logical networks for increased performance and traffic isolation.
    1. The following VLANs shall be established as a minimum.
        a. VLAN 10: Servers, operator thin clients, and workstations.
        b. VLAN 11: PLCs and associated OITs.
        c. VLAN 12: (Reserved)
        d. VLAN 13: Device level I/O network: MCCs, VFDs, UPS, etc.
    2. Additional VLANs shall be configured as required for specific traffic segregation requirements.

3.06 PROGRAMMABLE LOGIC CONTROLLER (PLC) PROGRAMMING:

A. The PLCs shall be programmed utilizing the latest version of RSLogix Studio 5000 software as applicable for the specific PLCs.
B. Software and firmware versions shall be consistent across the project site. Systems Integrator shall coordinate versions with the equipment vendors to ensure conformance to the project standards.
C. The PLC program shall be thoroughly documented with explanations in the PLC program of the operation performed in each program line or rung.
D. Where possible the PLCs shall be programmed utilizing object-oriented programming (OOP) blocks and user defined data types (UDT) to maintain consistency throughout the PLC program. Programming blocks shall be developed with the worst-case scenario in mind to allow blocks to be adaptable throughout the project. The PLC object blocks shall be coordinated with the PlantPAx objects. The proposed blocks shall be submitted for review.

E. The PLC shall be programmed to perform the required logic for proper operation of the associated equipment.
F. The PLC shall monitor communications status on the network and alarm if communication failures occur.
G. The PLC shall monitor power status of the building or structure power supply.
   1. Logic shall be implemented that shall clear run contacts or shut down equipment when power to the facility is lost and perform routine startup of equipment after power restoration.
   2. Operator adjustable time delays shall be established between the restarting of motor driven equipment.
H. Systems Integrator shall be responsible for establishing the network IP Addresses for the system within the ranges provided by the Owner's IT Department
   1. The Systems Integrator shall provide a range of IP Addresses to each equipment manufacturer with networked components.
I. Each alarm point shall have a programmed 2 second time delay to prevent "nuisance" or "false" alarms.
J. Momentary start contacts shall be programmed to close for 2 seconds and then open. Momentary stop contacts shall be programmed to open and stay open until shutdown of the motor is detected.
K. All required field programming and tuning of the control loops shall be included.

3.07 ELECTRICALLY ACTUATED VALVES - GENERAL:

A. System Components and Functions:
   1. Typical for all actuated valves. Specific valve requirements and valve functions are described within each process control description herein.
B. Description of Operation:
   1. Electrically actuated valves shall be capable of being controlled locally at the valve actuator or remotely at the operator workstation.
   2. Local Control:
      a. Valve shall be opened and closed by manually actuating the handwheel or the open/close controls at the actuator control station.
   3. Remote Control:
      a. Valves shall be opened and closed by the PCS.
      b. For modulating valves, the valve position (0-100%) shall be controlled by the PCS through the indicated 4-20mA signal where 4mA is fully closed and 20mA is fully open.
      c. HMI screens shall be developed to allow the operator to select from two modes of operation for each valve.
         (1) Remote Manual Control Mode:
            (a) Valves opened and closed by the operator at the associated OIT.
            (b) Valve position shall be based on the operator input setpoint when applicable for modulating valves.
         (2) Automatic Control Mode:
            (a) The valve shall be controlled by the PCS.
            (b) Refer to process descriptions herein for specific automatic valve control requirements.

4. Valve position feedback and position limit switch monitoring:
    a. The open and closed status from valve limit switches and valve position feedback (when applicable) shall be displayed on the operator workstations.
    b. Programming shall be provided for all valve function blocks to include fail to open and fail to close alarms based on the specified feedback signals.
    c. If a valve is signaled to open or closed, the feedback limit switches and position shall be monitored for proof of valve response. If the open or closed limit switch does not provide positive feedback within a pre-programmed delay time, an alarm shall be sent to the operator workstation.
    d. If a process control sequence is in automatic mode, the program shall pause the sequence when possible system upsets can occur.

C. Setpoints and Ranges:
1. Valve position: 0-100%.
2. Valve Open Delay: [Valve opening time + 10%] (seconds).
    a. Systems Integrator shall coordinate with specific valves supplied to determine valve opening times.
3. Valve Close Delay: [Valve close time + 10%] (seconds).
    a. Systems Integrator shall coordinate with specific valves supplied to determine valve closing times.

D. System Upsets and Procedures for Recovery:

E. If a valve fails to open or close, the control system shall alarm the operator via the operator workstation.

3.08 ELECTRICALLY ACTUATED SLIDE GATES - GENERAL:

A. System Components and Functions:
1. Typical for all actuated slide gates. Specific gate requirements and gate functions are described within each process control description herein.

B. Description of Operation:
1. Electrically actuated gates shall be capable of being controlled locally at the gate actuator or remotely at the operator workstation.
2. Local Control:
    a. The gate shall be opened and closed by manually actuating the handwheel or the open/close controls at the actuator control station.
3. Remote Control:
    a. The gates shall be opened and closed by the PCS.
    b. The gate position (0-100%) shall be controlled by the PCS through the indicated open/close contact outputs.
    c. HMI screens shall be developed to allow the operator to select from two modes of operation for each gate.
        (1) Remote Manual Control Mode:
            (a) Gates opened and closed by the operator at the associated OIT.
            (b) Gate position shall be based on the operator input setpoint when applicable.
        (2) Automatic Control Mode (When Applicable):
            (a) The gate shall be controlled by the PCS.
            (b) Refer to process descriptions herein for specific automatic gate control requirements.

4. Gate position feedback and position limit switch monitoring:
    a. The gate position feedback shall be displayed on the operator workstations.
    b. Programming shall be provided for all gate function blocks to include fail to open and fail to close alarms based on the specified feedback signals.
    c. If a gate is signaled to open or closed, the feedback limit switch(es) and position feedback shall be monitored for proof of response. If the system does not provide positive feedback or limit switch proof of close within a pre-programmed delay time, an alarm shall be sent to the operator workstation.
    d. If a process control sequence is in automatic mode, the program shall pause the sequence when system upsets can occur.

C. Setpoints and Ranges:
1. Gate position: 0-100%.
2. Gate Open Delay: [Gate opening time + 10%] (seconds).
    a. Systems Integrator shall coordinate with specific gates supplied to determine opening times.
3. Gate Close Delay: [Gate close time + 10%] (seconds).
    a. Systems Integrator shall coordinate with specific gates supplied to determine closing times.

D. System Upsets and Procedures for Recovery:
1. If a gate fails to open or close, the control system shall alarm the operator via the operator workstation.

3.09 COARSE SCREEN SYSTEM:

A. System Components and Functions:
1. Screen System Main Control Panels IPS-MCP-010 and IPS-MCP-020.
    a. Manufacturer provided control panels for control of screen IPS-MCP-010 and IPS-MCP-020, respectively, containing starters, relays, circuit breakers, screen system PLC, operator interface, and other ancillaries necessary for control of the equipment.
2. Screen IPS-SCR-010 and IPS-SCR-020.
    a. Mechanical bar screens designed to remove solids and debris from the liquid stream.
3. Level Transmitter IPS-LT-010A and IPS-LT-010B.
    a. Radar level transmitters for measuring the screen and IPS-SCR-010 upstream and downstream channel levels respectively.
4. Level Transmitter IPS-LT-020A and IPS-LT-020B.
    a. Radar level transmitters for measuring the screen and IPS-SCR-020 upstream and downstream channel levels respectively.
5. Level Switch IPS-LSH-010 and IPS-LSH-020.
    a. Provides a high-level alarm for the screen IPS-SCR-010 and IPS-SCR-020 channels, respectively.

B. Description of Operation:
    a. The manufacturer provided control panel shall be equipped with HAND/OFF/AUTO switches, status indicating lights, and fail indicating lights.
        (1) When the switch is in the HAND position, the corresponding piece of equipment shall be started and stopped at the control panel or remotely mounted control station.

(2) The Plant Control System shall provide a System Inhibit signal to the manufacturer provided control panel. The signal shall prevent operation of the screen system equipment.
(3) When the switch is in the AUTO position the screen shall operate automatically as described below.
(a) The screen shall be started and stopped by the screen system main control panel based upon channel head differential across the screen as measured by the corresponding level transmitter.
(b) The screen system main control panel shall be programmed by the screen system manufacturer. Refer to Section 46 21 13 for the screen system description of operation.
(c) High Flow Mode and Remote Cycle:
1). While in AUTO, the screen system shall accept a start signal from the plant control system for remote start capability.
2). The operator screen shall include a Screen Cycle Test pushbutton and a Screen Continuous Run - High Flow Enable/Disable selector switch and a High Flow Setpoint.
a). When the cycle pushbutton is depressed the PCS shall enable the remote call to run bit in the Screen System PLC to initiate a cycle.
b). When the High Flow Enable/Disable selector is in the Disable position, the remote call shall not be automatically initated.
c). When the High Flow Enable/Disable selector is in the Enable position, the PCS shall automatically initiate the remote call to run bit when the plant flow reaches an operator adjustable setpoint.

b. Refer to System Upsets and Procedures for Recovery Section for additional programming requirements.
c. The status points and alarms for the screen shall be displayed on the operator workstation. Alarm and status points shall be communicated to the Plant Control System through the control system Ethernet network. Refer to the I/O list at the end of this Section and corresponding control drawings for I/O status and alarm points.

C. Setpoints and Ranges:
1. Level Transmitter IPS-LIT-010 and IPS-LIT-020.
a. Level transmitters are provided by the screen system manufacturer.
b. Calibration ranges for the associated upstream and downstream sensors shall be as recommended by the system manufacturer.
2. Level Switches IPS-LSH-010 and IPS-LSH-020:
a. Point level switch provided by the screen system manufacturer.
b. High Level Alarm level switches initially set at 819.67' msl or as recommended by the screen system manufacturer.
3. Operator Workstation:
a. Display range for each level transmitter shall be coordinated with the screen manufacturer.
b. Differential level alarm shall be adjustable.
c. High level alarm based on IPS-LSH-010 and IPS-LSH-020.

d. Screen Continuous Run - High Flow adjustable setpoint initially set at 9.0 MGD.

D. System Upsets and Procedures for Recovery:
1. If a screen failure occurs, the control system shall alarm the operator via the operator workstation.
2. If a power failure occurs, the equipment that was in operation prior to the power failure shall be automatically restarted by the manufacturer-provided control panel.
3. If a level transmitter signal is lost, the control system shall alarm the operator via the operator workstation.
4. If a jam or over-torque condition occurs in the screen that cannot be cleared by the system, the associated equipment shall automatically stop and initiate a failure alarm at the operator workstation.
5. Safety Devices:
a. Emergency stop push buttons and pull cord switches, as applicable, shall be interlocked with the corresponding screen starting circuit.
b. In the event of an emergency stop push activation, the corresponding equipment will shut down and alarm the operator. The emergency stops shall require a manual reset to restart the equipment.
c. An emergency stop condition shall initiate an e-stop alarm at the operator workstation.

3.10 HYDROGEN PEROXIDE STORAGE AND FEED SYSTEM

A. Hydrogen Peroxide Main Control Panel (H202-MCP-100):
1. The Hydrogen Peroxide Main Control Panel is the dedicated, skid-mounted controller that monitors bulk tank level, chemical storage and feed instrumentation, and operates the pumps.

B. Hydrogen Peroxide Bulk Tank
1. System Components and Functions:
a. Hydrogen Peroxide Bulk Tank H2O2-TNK-101.
b. Level Transmitter H202-LT-101.
(1) Measures level in the Hydrogen Peroxide Bulk Tank H2O2-TNK-101.
c. Level Indicator H2O2-LI-101.
(1) Display of the Hydrogen Peroxide Bulk Tank H2O2-TNK-101 level on the tank pad.
2. Description of Operation:
a. Tank Level:
(1) The level of the tank shall be measured by its associated level transmitter H202-LIT-101.
(2) The level of the tank shall be displayed in feet to the nearest tenth on the operator workstation.
(3) The volume of liquid shall be calculated and displayed in gallons to the nearest tenth on the operator workstation.
(4) Level alarms and loss of signal alarms shall be set for each tank.
(5) The levels shall be trended.
3. Set Points and Ranges:
a. Level Transmitter H202-LT-101:
(1) Level transmitter with integral display.
(2) Exact ranges will be dependent on dimensions of the tanks provided by the Contractor. Setpoints and ranges provided are approximate.

b. Level Indicator H202-LI-101:
(1) Large display level indicator.
(2) Calibration range of 0-100%.

4. Operator Workstation:
a. Display range of 0-13.5 feet and 0-6,500 gallons for each tank.
b. Low level warning adjustable between 0-5 feet initially set at 2.0 feet.
c. Low-low level alarm adjustable between 0-5 feet initially set at 1.0 feet.
d. High level alarm adjustable between 6-13.5 feet initially set at 9 feet.

5. System Upsets and Procedures for Recovery:
a. If a tank level signal is lost or out of range, the control system shall alarm the operator via the operator workstation.

C. Hydrogen Peroxide Feed System

1. System Components and Functions:
a. Hydrogen Peroxide Metering Pumps H202-PMP-110 and H202-PMP-110.
(1) Pumps Hydrogen Peroxide into the off-site upstream manhole. One pump shall be the duty and one pump shall be the standby.
b. Metering Skid Pressure Indicating Transmitter H202-PIT-101.
(1) Measures the pressure on the Hydrogen Peroxide metering skid discharge line. Range shall be coordinated with the chemical feed manufacturer.
c. Metering Skid Pressure Indicating Transmitter H202-FIT-101.
(1) Measures the flow from the Hydrogen Peroxide metering skid discharge line. Range shall be coordinated with the chemical feed manufacturer.

2. Description of Operation:
a. The pumps shall be capable of being controlled locally at the associated integral operator interface display and keypad or remotely by the plant control system when the pump control LOCAL/OFF/REMOTE selection is in Remote control.
b. Local Control:
(1) When the pumps are in LOCAL control, starting and stopping of the pumps and the feed rate of the pumps shall be controlled at the associated pump local control panel display/keypad.
c. Remote Control:
(1) When the pumps are in REMOTE control, starting and stopping of the pumps, and the feed rate of the pumps shall be controlled by the plant control system PLC.
(2) Remote Manual Control Mode:
(a) The plant control system PLC shall start and stop each pump and adjust the speed of the pump using a 4-20 mA signal correlating to 0 to 100% speed as manually entered by the operator at the operator workstation.
(3) Remote Automatic Control Mode:
(a) The chemical feed skid's main control panel (MCP) shall start and stop each pump and adjust the speed of the pump based on 4-20 mA influent flow and dosing rate signals provided by the plant control system PLC.
1). The pump speed signal shall be calculated by the MCP using a chemical feed calculation based on flow and a dosing rate input by the operator at the operator workstation.
2). The feed rate in gallons per hour of the metering pump shall be calculated by the following equation:

$$\frac{(Q_{RAW}\ in\ MGD) \times (peroxide\ dose\ rate\ in\ \frac{mg}{L}) \times 1.04}{\left(\frac{soln\ conc}{100}\right) \times (SG) \times 24\ {}^{hrs}/_{dy}}$$

Where: Q_{RAW} is the raw water flow as measured by GRSC-FIT-001, *soln conc* is the solution concentration entered by the operator, and *SG* is the specific gravity entered by the operator.

d. If one pump fails, the plant control system shall automatically start the standby pump and alarm the operator through the operator workstation.
e. The pumps shall have a relay output to the PLC representing a general failure alarm. The operator may view the specific alarm type at the pump's integral display.
f. The run status, fail status and remote status shall be displayed on the operator workstation for each metering pump.
g. If the influent signal is lost, the output signal shall remain at the last detected signal and alarm the operator at the operator workstation.
h. If low pump discharge pressure is detected, the plant control system shall automatically stop the feed pumps. The low pressure setpoint shall be operator adjustable.
i. Feed rate for the pumps shall be trended.
j. Refer to the I/O list at the end of this section and corresponding control drawings for I/O status and alarm points.

3. Set Points and Ranges:
   a. Hydrogen Peroxide Metering Pumps:
      (1) Feed rate range of 0-30 gallons per hour. Range shall be coordinated with the chemical feed manufacturer
   b. Dosage Setpoints
      (1) The Dosage Setpoint is adjustable from 0.001 to 30 mg/L, with an initial setting of 5 mg/L.
   c. Pressure Alarms
      (1) Operator adjustable range of 0-100 psi, initially set at 40 psi.
      (2) Low Pressure Alarm initially set at 40 psi or as recommended by the feed system manufacturer.
   d. Pressure Indicating Transmitter:
      (1) Adjustable range of 0-100 psi. Range shall be coordinated with the chemical feed manufacturer.
   e. Flow Indicating Transmitter:
      (1) Adjustable range of 0.0 to 40.0 GPH. Range shall be coordinated with the chemical feed manufacturer.
   f. Operator Workstation:
      (1) Feed rate range of 0-30 (mg/Las H2O2)
      (2) Bulk Tank low level shutdown adjustable between 0-1,000 gallons, initially set at 200 gallons.
4. System Upsets and Procedures for Recovery:
   a. If a pump fault alarm occurs or signal has been lost, the control system shall alarm the operator via the operator workstation.
   b. If the bulk tank level signal is lost, the control system shall alarm the operator via the operator workstation.

3.11 SCREENING ODOR CONTROL:

A. System Components and Functions:
   1. Odor Control Main Control Panel ODR-MCP-200
      a. Manufacturer provided control panel.

B. Odor Control:
   a. Refer to Section 44 31 19 – Odor Control System for description of operation of the odor control system.
   b. A system inhibit shall be provided to the main control panel PLC via the PCS network. If the inhibit is active, the odor control system shall be not be allowed to run.

3.12 COARSE SCREENING BUILDING COMBUSTIBLE AND OZONE GAS DETECTION:

A. System Components and Functions:
   1. Gas Detection Control Panel IPS-AIT-001:
      a. Indicating and annunciating controller located in the Coarse Screening Building electrical room.
   2. Remote Gas Transmitter IPS-AE-001:
      a. Methane gas level transmitter and sensor located in the Coarse Screening Building's screen room.
   3. Remote Gas Transmitter IPS-AE-003:
      a. Hydrogen Sulfide gas level transmitter and sensor located in the Coarse Screening Building's screen room.
   4. Ozone Detection Control Panel IPS-AIT-002:
      a. Ozone gas level transmitter and sensor located in the Coarse Screening Building electrical room. Ozone is pumped from the element locations to the ozone gas transmitter via an integral sample pump. The sample gas is processed by an internal scrubber and exhausted to the exterior of the building.
   5. Remote Gas Sensing Elements IPS-AE-002A/B/C:
      a. Ozone gas sampling inlets located in the Coarse Screening Building's screen room.
   6. Strobes IPS-STB-001, IPS-STB-003:
      a. Interior and exterior mounted strobe lights for visual annunciation of combustible gas alarm and ventilation failure.
   7. Strobes IPS-STB-002, IPS-STB-004:
      a. Interior and exterior mounted strobe lights for visual annunciation of ozone gas alarm.
   8. Horn IPS-HRN-001, IPS-HRN-002:
      a. Interior and exterior mounted horn for audible annunciation of ozone gas alarm, combustible gas alarm, and ventilation failure.

B. Description of Operation:
   1. Combustible Gas and Hydrogen Sulfide Gas:
      a. The combustible and hydrogen sulfide gas levels in the Coarse Screening Building area shall be measured by combustible gas level sensors IPS-AE-001 and IPS-AE-003, respectively.
      b. The sensor shall transmit the corresponding gas level to the gas detection control panel IPS-AIT-001 via analog (4-20mA) signals.
      c. The alarm relay in combustible gas detector control panel shall be set to close at 10% LEL for combustible gas and 10 PPM for hydrogen sulfide sensor channels. The alarm relay shall be wired to specified strobes and horns. The strobes and

horns shall annunciate and alert personnel of high combustible gas levels or a failure of the ventilation system within the Coarse Screening Building area.

d. The operator workstation shall include alarm indicators to distinguish between a ventilation failure and a high combustible gas level.

e. A test switch shall be installed in the face of the PLC control panel to allow testing functions of the Audible/Visual warning system.

f. The gas levels shall be displayed locally at the gas detection control panel IPS-AIT-001 and on the operator workstation. High level and loss of signal alarms shall be programmed.

g. Gas levels shall be trended.

2. Ozone Gas:

a. The ozone gas level in the Coarse Screening Building area shall be measured by combustible gas level sensor IPS-AIT-002.

b. The sensor shall transmit the corresponding gas levels to the IPS-PLC-061 via analog (4-20mA) signals.

c. The alarm relay in the ozone gas detector control panel shall be set to close at 0.1 PPM for all sensor channels. The alarm relay shall be wired to specified strobes and horns. The strobes and horns shall annunciate and alert personnel of high ozone gas levels or a failure of the ventilation system within the Coarse Screening Building area.

d. Upon detection of an operator-adjustable ozone level alarm, an inhibit signal shall be sent to the odor control system (ODR-MCP-200) to prevent the system from running.

(1) The inhibit signal shall be an optional operational mode, selectable on the operator workstation.

e. A test switch shall be installed in the face of the PLC control panel to allow testing functions of the Audible/Visual warning system.

f. The ozone gas level shall be displayed locally at the ozone gas detection transmitter IPS-AIT-002 and on the operator workstation. High level and loss of signal alarms shall be programmed.

g. Ozone gas levels shall be trended.

3. A test switch shall be installed in the face of the PLC control panel to allow testing functions of the Audible/Visual warning system.

C. The gas detection system status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this Section and corresponding control drawings for I/O status and alarm points.

D. Set Points and Ranges:

1. Gas Transmitter IPS-AE-001:

a. Combustible gas transmitter with integral display.

b. Refer to Section 40 70 00A Instrument List for calibration ranges.

c. High level alarm set at 10% LEL.

2. Gas Transmitter IPS-AIT-002:

a. Ozone gas transmitter with integral display.

b. Refer to Section 40 70 00A Instrument List for calibration ranges.

c. High level alarm set at 0.1 PPM.

3. Gas Transmitter IPS-AE-003:

a. H2S gas transmitter with integral display.

b. Refer to Section 40 70 00A Instrument List for calibration ranges.

c. High level alarm set at 10 PPM.

4. Operator workstation:
   a. Display range of 0-100% LEL for each combustible gas transmitter.
   b. Display range of 0-0.2 PPM for each ozone gas sample channel.
   c. Display range of 0-200 PPM for each H2S gas transmitter.

E. System Upsets and Procedures for Recovery:
1. If the combustible gas detector signal is lost, the control system shall alarm the operator via the operator workstation.

3.13 HEADWORKS COMBUSTIBLE GAS DETECTION:

A. System Components and Functions:
1. Gas Detection Control Panel GRSC-AIT-001:
   a. Indicating and annunciating controller located in the headworks electrical room.
2. Remote Gas Transmitter GRSC-AE-001:
   a. Methane gas level transmitter and sensor located in the headworks area first level.
3. Remote Gas Transmitter GRSC-AE-002:
   a. Methane gas level transmitter and sensor located in the headworks area second level.
4. Strobe GRSC-STB-401, GRSC-STB-402, and GRSC-STB-403:
   a. Interior and Exterior mounted strobe lights for visual annunciation of gas alarm and ventilation failure.
5. Horn GRSC-HRN-401:
   a. Exterior mounted horn for audible annunciation of gas alarm and ventilation failure.

B. Description of Operation:
1. The combustible gas level in the headworks area shall be measured by combustible gas level sensor GRSC-AE-001 and GRSC-AE-002.
2. The sensors shall transmit the corresponding gas level to the gas detection control panel GRSC-AIT-001 via analog (4-20mA) signals.
3. The alarm relay in combustible gas detector control panel shall be set to close at 10% LEL for all sensor channels. The alarm relay shall be wired to specified strobes and horns. The strobes and horns shall annunciate and alert personnel of high combustible gas levels or a failure of the ventilation system within the headworks area.
4. The operator workstation shall include alarm indicators to distinguish between a ventilation failure and a high combustible gas level.
5. A test switch shall be installed in the face of the PLC control panel to allow testing functions of the Audible/Visual warning system.
6. The combustible gas level shall be displayed locally at the gas detection control panel GRSC-AIT-001 and on the operator workstation. High level and loss of signal alarms shall be programmed.
7. Combustible gas levels shall be trended.

C. The gas detection system status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this Section and corresponding control drawings for I/O status and alarm points.

D. Set Points and Ranges:
1. Gas Transmitter GRSC-AE-001 and GRSC-AE-002:
   a. Combustible gas transmitter with integral display.
   b. Refer to Section 40 70 00A Instrument List for calibration ranges.
   c. High level alarm set at 10% LEL.

2. Operator workstation:
    a. Display range of 0-100% LEL for each gas transmitter.

E. System Upsets and Procedures for Recovery:
1. If the combustible gas detector signal is lost, the control system shall alarm the operator via the operator workstation.

3.14 INFLUENT PUMP STATION:

A. The Influent Pump Station is composed of two sides, each with submersible pumps. In normal operation, the sides are equalized, and the automatic pumping sequence utilizes all pumps in concert. The sides may be isolated from each other using motorized gates. In isolation mode, only one side's pumps are available for automatic operation while the opposite side's pumps are taken out of service.

B. System Components and Functions:
1. Influent Wet Well No. 1:
    a. Influent Pump No. 1: IPS-PMP-110.
        (1) Submersible pump controlled by a VFD.
    b. Influent Pump No. 2: IPS-PMP-120.
        (1) Submersible pump controlled by a VFD.
    c. Influent Pump No. 3: IPS-PMP-130.
        (1) Submersible pump controlled by a VFD.
    d. Level Indicating Transmitter: IPS-LIT-101.
        (1) Radar level transmitter used for measuring the Influent Wet Well No. 1 level.
2. Influent Wet Well No. 2:
    a. Influent Pump No. 4: IPS-PMP-140.
        (1) Submersible pump controlled by a VFD.
    b. Influent Pump No. 5: IPS-PMP-150.
        (1) Submersible pump controlled by a VFD.
    c. Level Indicating Transmitter: IPS-LIT-102.
        (1) Radar level transmitter used for measuring the Influent Wet Well No. 2 level.
3. Level Float Switches: Located in the influent pump station wet wells.
    a. Influent Wet Well No. 1:
        (1) IPS-LSH-101.
            (a) High level float switch used for pump control interlock and warning.
        (2) IPS-LSHH-101.
            (a) High-high level float switch used for pump control interlock and alarm.
        (3) IPS-LSL-101.
            (a) Low level float switch used for pump control interlock and warning.
        (4) IPS-LSLL-101.
            (a) Low-low level float switch used for pump shut-down interlock and alarm.
    b. Influent Wet Well No. 2:
        (1) IPS-LSH-102.
            (a) High level float switch used for pump control interlock and warning.
        (2) IPS-LSHH-102.
            (a) High-high level float switch used for pump control interlock and alarm.
        (3) IPS-LSL-102.
            (a) Low level float switch used for pump control interlock and warning.
        (4) IPS-LSLL-102.

(a) Low-low level float switch used for pump shut-down interlock and alarm.

4. Influent Flow Transmitter: GRSC-FIT-001.
   a. Magnetic flow meter measures Influent Pump Station discharge flow.

C. Description of Operation:
1. Wet Well Level:
   a. The level in the wet wells shall be measured by level transmitters IPS-LIT-101 and IPS-LIT-102.
   b. The two level transmitters shall serve as redundant devices and the HMI screen shall allow the operator to select which transmitter is currently being utilized for control.
   c. The levels from both transmitters shall be displayed on the operator workstation and high-high, high, low, and low-low level and loss of signal alarms shall be set. The level alarms shall be based upon the measurement from the selected transmitter.
   d. The redundant transmitter levels shall be compared under normal operating conditions by the following formula:
      (1) $$\frac{|(IPS{-}LIT{-}101) - (IPS{-}LIT{-}102)|}{\{[(IPS{-}LIT{-}101) + (IPS{-}LIT{-}102)] \div 2\}}$$
      (2) If the difference percentage results in a value initially set at 10%, an operator warning shall be initiated. The percentage setpoint shall be operator adjustable.
      (3) If one of the transmitters is disabled by the operator, the warning shall be disabled.
   e. If a loss of signal alarm is detected the control system shall automatically switch to the other transmitter and alert the operator at the operator workstation.
   f. The levels shall be displayed in feet to the nearest tenth on the operator workstation.
   g. The levels for both transmitters shall be trended.
2. Influent Pump Station Flow:
   a. The influent pump station flow shall be measured by flow transmitter GRSC-FIT-001.
   b. The flow shall be displayed in gpm (gallons per minute) and MGD (million gallons per day) on the operator workstation.
   c. High flow and loss of signal alarms shall be programmed.
   d. The influent flow shall be trended.
3. Influent Pumps:
   a. The pumps shall be capable of being controlled locally at the associated pump VFD or remotely by the plant control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
   b. Level control for the pumps shall be based on the signal from the selected level transmitter.
   c. Local Control:
      (1) When the pumps are in LOCAL control, starting and stopping of the pumps and the speed of the pumps shall be controlled at the associated VFD.
   d. Remote Control:
      (1) When the pumps are in REMOTE control, starting and stopping of the pumps, and the speed of the pumps shall be controlled by the plant control system PLC.

(2) When the start/stop contact associated with the pump is closed to the VFD, the corresponding pump shall start and run. When the start/stop contact is opened to the VFD, the corresponding pump shall stop.
(3) HMI screens shall be developed to allow the operator to select from two modes of operation.
(4) Remote Manual Control Mode:
  (a) Starting and stopping of each of the pumps initiated by the operator at the operator workstation.
  (b) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.
(5) Remote Automatic Control Mode:
  (a) Control of each pump will be determined by the status of the VFD and BYPASS inputs determined by the VFD-OFF-BYPASS switches located on the face of the VFD enclosures.
  (b) VFD Control Mode:
    1). The plant control system PLC shall automatically start and stop pumps and adjust the speed of the pumps to maintain the level set point in the wet well.
    2). The measured flow rate shall be based on flow meter GRSC-FIT-001 and shall be utilized for conditional high flow control.
    3). The pumps shall be rotated automatically by the control system or manually by the operator. Selections shall be made available on the operator workstation screen for this function.
    4). Pumps IPS-PMP-110, IPS-PMP-130, and IPS-PMP-150 shall be rotated for service within Pump Group 2.
    5). Pumps IPS-PMP-120 and IPS-PMP-140 shall be rotated for service within Pump Group 1.
    6). Rotation shall be automatic within each group by the system after an operator adjustable time period or after each pump cycle. The rotation timer shall automatically reset if the pumps rotate because of a pump cycle.
    7). The pump(s) speed shall be controlled using a PID algorithm to maintain a Level Setpoint in the wet well.
    8). Sequence of Operation:
      a). Seven (7) pump combinations shall be programmed for the system as follows:
      b). Step 1: One pump from Pump Group 1.
      c). Step 2: One pump from Pump Group 2.
      d). Step 3: One pump from Pump Group 1 and one pump from Group 2.
      e). Step 4: Two pumps from Pump Group 2.
      f). Step 5: One pump from Pump Group 1 and two pumps from Pump Group 2.
      g). Step 6: Two pumps from Pump Group 1 and two pumps from Pump Group 2.
      h). Step 7 (if one of Pump Group 1 pumps out of service): Three Pumps from Pump Group 2.

i). When the wet well level rises above the design level setpoint to the Step 1 Pump Start, the associated pump shall start. The pump speed shall be modulated to maintain the level set point.

j). If the Step 1 pump is operating at 100% speed and the wet well level rises to the Step 2 start setpoint, the next pump in the sequence shall start after a Pump Start time delay. If the level falls below the Step 2 start setpoint prior to the time delay expiration, the timer shall be reset.

k). When the next pump is called to start, it shall ramp to 100% speed to match the operating pump speed and the pump combination shall be modulated together to maintain the level set point.

l). If flow into the wet well increases, this sequence shall continue through all assigned pump steps until the wet well level is maintained.

m). If flow into the wet well decreases, the pump combination is operating at minimum speed, and the associated Step Off setpoint is reached, the designated pump shall ramp down to zero speed and shut down. The pumps lead/lag role shall be rotated at this time.

n). The pumps in each pump group shall automatically rotate after each start/stop cycle or once every 24-hour time period, whichever occurs first. The rotation time shall be operator adjustable.

o). The remaining pumps shall continue to modulate to achieve the level set point.

p). As flow continues to decrease to a point that only one pump is operating (Step 1), the pump shall operate until the following pump shutdown conditions are met:

q). All other pumps are off.

r). The pump is running at the associated minimum speed.

s). The wet well level reaches the Step 1 Stop set point.

(6) Wet Well Isolation Mode

(a) The Wet Well Isolation Mode is intended to be a supplementary mode to allow either wet well side to be taken out of service, while the other wet well side remains in service.

1). While this mode is active, a descriptive notification popup shall be displayed on the operator screen.

(b) Prior to the activation of the Wet Well Isolation mode, the following gates must be closed by the operator at the operator workstation:

1). Wet Well No. 1 Isolation: Operator shall close IPS-GATE-101 and IPS-GATE-001. These gates shall be interlocked to not allow Wet Well No. 1 to be isolated if the gates are open.

2). Wet Well No. 2 Isolation: Operator shall close IPS-GATE-101 and IPS-GATE-002. These gates shall be interlocked to not allow Wet Well No. 2 to be isolated if the gates are open.

(c) Pump Status:

1). All pumps associated with the wet well to be isolated must be stopped and taken out of the automatic control sequence.
a). Wet Well No. 1: IPS-PMP-110, IPS-PMP-120, IPS-PMP-130.
b). Wet Well No. 2: IPS-PMP-140, IPS-PMP-150.

(d) The operator must manually select and activate the specific "Wet Well Isolation Mode" (e.g., "Wet Well 1 Isolation Mode" or "Wet Well 2 Isolation Mode") via the operator workstation HMI.

(e) Once the isolation mode has been selected, the following pump control shall occur:
1). Wet Well No. 1 Isolation:
a). All influent flow will be directed to Influent Wet Well No. 2.
b). Only pumps IPS-PMP-140 and IPS-PMP-150 shall be available for automatic or manual control. The pump control logic shall utilize these two pumps through the pump sequence.
2). Wet Well No. 2 Isolation:
a). All influent flow will be directed to Influent Wet Well No. 1.
b). Only pumps IPS-PMP-110, IPS-PMP-120 and IPS-PMP-130 shall be available for automatic or manual control. The pump control logic shall utilize these two pumps through the pump sequence.

(f) Level Indicating Transmitters:
1). The control system shall rely solely on the level indicating transmitter (LIT) of the active wet well.
2). Wet Well No. 1 Isolation: IPS-LIT-102 shall be selected for level control.
3). Wet Well No. 2 Isolation: IPS-LIT-101 shall be selected for level control.
4). The redundant transmitter error calculation for the isolated wet well shall be suspended while Wet Well Isolation Mode is activated.

(g) High, high-high, low, and low-low level alarms shall be active only for the non-isolated wet well and its corresponding level transmitter. High and high-high level control backup modes, as described below, shall be active only for the pumps associated with the active wet well.
1). Wet Well No. 1 Isolation Level Alarms and Backup Control: IPS-LSH-102, IPS-LSHH-102, IPS-LSL-102, IPS-LSLL-102.
2). Wet Well No. 2 Isolation Level Alarms and Backup Control: IPS-LSH-101, IPS-LSHH-101, IPS-LSL-101, IPS-LSLL-101.

(h) The pump status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this section and corresponding control drawings for I/O status and alarm points.

(7) High Level Control Backup Mode:
(a) The High Level Control Backup Mode is intended to be a supplementary mode to ensure the pumps operate in the event the primary and secondary level transmitters are not functional or reading incorrect wet well levels.

1). While this mode is active, a descriptive notification popup shall be displayed on the operator screen.

(b) If the wet well level rises above the high level set point (IPS-LSH-101), the control system shall automatically call for the next Step in the operating sequence to begin after a high level pump start delay.

(c) All operational pumps will operate at 100% speed.

(d) As long as the wet well level is above the high level set point, the control system will continue to call for the next Step (following a pump start delay for each transition) in the operating sequence until the pump shut off level is reached.

(e) Once the pumps shut off, control will revert back to the Remote Automatic Control Mode.

(8) High High Level Control Backup Mode

(a) The High-High Level Control Backup Mode is intended to be a supplementary mode to ensure the pumps operate in the event the primary and secondary level transmitters are not functional or reading incorrect wet well levels.

1). While this mode is active, a descriptive notification popup shall be displayed on the operator screen.

(b) If the wet well level rises above the high-high level set point (IPS-LSHH-101), the control system shall automatically call for the Next Step in the operating sequence to begin after a high high level pump start delay.

(c) All operational pumps will operate at 100% speed.

(d) As long as the wet well level is above the high level set point, the control system will continue to call for the next Step (following a pump start delay for each transition) in the operating sequence until the pump shut off level is reached.

(e) Once the pumps shut off, control will revert back to the Remote Automatic Control Mode.

(9) VFD Bypass Control Mode:

1). If a pump is in VFD bypass mode, that pump shall remain available in the control sequence and will be energized and de-energized when the program calls for the pump to start or stop, respectively. Speed control will not be available while the pump is in VFD Bypass. Otherwise, pump control shall conform to Remote-Automatic VFD mode requirements.

(b) Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

e. The pump status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this section and corresponding control drawings for I/O status and alarm points.

D. Setpoints and Ranges:

1. Level Indicating Transmitter IPS-LIT-101 and IPS-LIT-102:
   a. Level transmitter with integral display.
   b. Refer to Section 40 70 00 for instrument calibration ranges.
2. Influent Pump Variable Frequency Drives:
   a. Ramp up time: Adjustable setpoint initially set at 10 seconds.

b. Ramp down time: Adjustable setpoint initially set at 10 seconds.
c. Minimum Speed: 75% initial.
(1) Final setpoint shall be determined during system startup.

3. Timer Set Points:
a. Pump Start Delay (adjustable) initially set at: 15 seconds.
b. Pump Rotation time (adjustable) initially set at: 24 hours.
c. High Level Pump Start Delay (adjustable) initially set at 30 seconds.
d. High High Level Pump Start Delay (adjustable) initially set at 10 seconds

4. Operator Workstation:
a. Wet Well Level Setpoints (Adjustable over the range of the instrument.):
(1) Zero level for the level transmitters shall be at elevation 803.66' msl.
(2) Step 1 Start set point initially set at: 5.00 feet (808.66' msl).
(3) Step 2 Start set point initially set at: 6.00 feet (809.66' msl).
(4) Step 3 Start set point initially set at: 6.50 feet (810.16' msl).
(5) Step 4 Start set point initially set at: 7.00 feet (810.66' msl).
(6) Step 5 Start set point initially set at: 7.00 feet (810.66' msl).
(7) Step 6 Start set point initially set at: 7.50 feet (811.16' msl)
(8) Step 1 Stop set point initially set at: 3.50 feet (807.16' msl).
(9) Step 2 Stop set point initially set at: 4.00 feet (807.66' msl).
(10) Step 3 Stop set point initially set at: 4.00 feet 807.66' msl).
(11) Step 4 Stop set point initially set at: 4.00 feet (807.66' msl).
(12) Step 5 Stop set point initially set at: 4.00 feet (807.66' msl).
(13) Step 6 Stop set point initially set at: 4.00 feet (807.66' msl).
(14) High-High Level Alarm initially set at: 11.00 feet (814.66' msl).
(15) High Level Warning initially set at: 8.50 feet (812.16' msl).
(16) Low Level Warning initially set at: 3.00 feet (806.66 msl).
b. Minimum Speed Setpoints:
(1) Step 1 minimum speed: Initially set at 83%.
(2) Step 2 minimum speed: Initially set at 88%.
(3) Step 3 minimum speed: Initially set at 90%.
(4) Step 4 minimum speed: Initially set at 93%.
(5) Step 5 minimum speed: Initially set at 94%.
(6) Step 6 minimum speed: Initially set at 95%.
(7) Minimum pump speed setpoints shall be tested and confirmed during pump commissioning to ensure observed positive flow at minimum level setpoint conditions.
c. Flow Transmitter: GRSC-FIT-001.
(1) Display range of 0.0-12,500 gpm.
(2) Display range of 0.00-18.00 MGD for total flow.
(3) High flow setpoint initially set at: 12.5 MGD.
d. Pressure Transmitters: IPS-PIT-110, IPS-PIT-120, IPS-PIT-130, IPS-PIT-140, IPS-PIT-150.
(1) Display range of 0.0-150 psig.
(2) High pressure setpoint (adjustable) initially set at 90 psig.
(3) High pressure alarm shall include respective pump in notification (for example, "High Pressure IPS Pump No. 1").

E. System Upsets and Procedures for Recovery:
1. If a pump failure occurs, the control system shall alarm the operator via the operator workstation.
2. If the primary level signal is lost or out of range, the control system shall alarm the operator via the operator workstation.
3. If the flow signal is lost or out of range, the plant control system shall alarm the operator via the operator workstation.
4. If a reverse flow is detected, the plant control system shall alarm the operator via the operator workstation.
5. If any wet well isolation gate is closed while a Wet Well Isolation Mode is not active, , the plant control system shall alarm the operator via the operator workstation.
6. System in Remote Automatic control mode:
a. Loss of Level Signal:
(1) If the level signal from the selected instrument is lost or out of range, the system shall maintain the pumps at current speed and alarm the operator via the operator workstation.
b. If a low level is detected by the level transmitter, all pumps shall be called to stop pumping. The pumps shall be allowed to run when the level rises above the pump run setpoint.
c. If a low low level is detected by the level switch, all pumps shall be called to stop pumping. The pumps shall be allowed to run if the low level switch returns to normal state, the alarm is cleared at the operator workstation, and level rises above the pump run setpoint.
d. If the high or high-high point level switches are activated, the system shall alarm the operator and shall perform in backup level control mode as described in the High Level Control Backup Mode and High-High Level Control Backup Mode.
e. In the event a pump in the sequence becomes unavailable, fails to start, or drops off-line, the next available pump in the sequence shall be automatically selected to operate.

3.15 SCREEN SYSTEM:

A. System Components and Functions:
1. Screen System Main Control Panels GRSC-MCP-100 and GRSC-MCP-200.
a. Manufacturer provided control panel for control of screen GRSC-SCR-110 and GRSC-SCR-210, respectively, containing starters, relays, circuit breakers, screen system PLC, operator interface, and other ancillaries necessary for control of the equipment.
2. Screen GRSC-SCR-110 and GRSC-SCR-210.
a. Mechanical perforated screen designed to remove solids and debris from the liquid stream.
3. Screening Auger Conveyor GRSC-AUG-120 and GRSC-AUG-220.
a. Auger Conveyor for handling screenings discharge and conveying to the screenings dumpster.
4. Level Transmitter GRSC-LE-100A and GRSC-LE-100B.
a. Ultrasonic level transmitters for measuring the screen GRSC-SCR-110 upstream and downstream channel levels respectively.
5. Level Transmitter GRSC-LE-200A and GRSC-LE-200B.

a. Ultrasonic level transmitters for measuring the screen GRSC-SCR-210 upstream and downstream channel levels respectively.

6. Level Switch GRSC-LSH-100 and GRSC-LSH-200.
   a. Provides a high-level alarm for the screens GRSC-SCR-110 and GRSC-SCR-210 channels, respectively.

B. Description of Operation:
   a. The manufacturer provided control panel shall be equipped with HAND/OFF/AUTO switches, status indicating lights, and fail indicating lights.
      (1) When the switch is in the HAND position, the corresponding piece of equipment shall be started and stopped at the control panel or remotely mounted control station.
      (2) The Plant Control System shall provide a System Inhibit signal to the manufacturer provided control panel. The signal shall prevent operation of the screen system equipment.
      (3) When the switch is in the AUTO position the screen shall operate automatically as described below.
         (a) The screen shall be started and stopped by the control panel based upon channel head differential across the screen as measured by the corresponding level transmitter.
         (b) A backup timer and high-level switch shall be provided to operate the screen periodically if a failure occurs with the level controls.
         (c) The parameters for the channel head differential and period of time between operations shall be set by the manufacturer.
         (d) High Flow Mode and Remote Cycle:
            1). While in AUTO, the screen system shall accept a start signal from the plant control system for remote start capability.
            2). The operator screen shall include a Screen Cycle Test pushbutton and a Screen Continuous Run - High Flow Enable/Disable selector switch and a High Flow Setpoint.
               a). When the cycle pushbutton is depressed the PCS shall enable the remote call to run bit in the Screen System PLC to initiate a cycle.
               b). When the High Flow Enable/Disable selector is in the Disable position, the remote call shall not be automatically initated.
               c). When the High Flow Enable/Disable selector is in the Enable position, the PCS shall automatically initiate the remote call to run bit when the plant flow reaches an operator adjustable setpoint.
   b. Refer to System Upsets and Procedures for Recovery Section for additional programming requirements.
   c. The status points and alarms for the screen shall be displayed on the operator workstation. Alarm and status points shall be communicated to the Plant Control System through the control system Ethernet network. Refer to the I/O list at the end of this Section and corresponding control drawings for I/O status and alarm points.

C. Setpoints and Ranges:
   1. Level Transmitter GRSC-LIT-100A and GRSC-LIT-100B.

a. Ultrasonic level transmitters are provided by the screen system manufacturer.
b. Calibration ranges for the associated upstream and downstream transducers shall be as recommended by the system manufacturer.

2. Level Switches GRSC-LSH-100 and GRSC-LSH-200:
   a. Float level switch provided by the screen system manufacturer.
   b. High Level Alarm level switches initially set at 937.00' msl or as recommended by the screen system manufacturer.
3. Operator Workstation:
   a. Display range for each level transmitter shall be coordinated with the screen manufacturer.
   b. Differential level alarm shall be adjustable.
   c. High level alarm based on GRSC-LSH-100 and GRSC-LSH-200.
   d. Screen Continuous Run - High Flow Setpoint initially set at 9.0 MGD.

D. System Upsets and Procedures for Recovery:
1. If a screen or auger conveyor failure occurs, the control system shall alarm the operator via the operator workstation.
2. If a power failure occurs, the equipment that was in operation prior to the power failure shall be automatically restarted by the manufacturer provided control panel.
3. If a level transmitter signal is lost, the control system shall alarm the operator via the operator workstation.
4. If a jam or over-torque condition occurs in the screen or auger conveyor that cannot be cleared by the system, the associated equipment shall automatically stop and initiate a failure alarm at the operator workstation.
5. Safety Devices:
   a. Emergency stop push buttons and pull cord switches, as applicable, shall be interlocked with the corresponding screen starting circuit.
   b. In the event of an emergency stop push activation, the corresponding equipment will shut down and alarm the operator. The emergency stops shall require a manual reset to restart the equipment.
   c. An emergency stop condition shall initiate an e-stop alarm at the operator workstation.

3.16 SCREEN SYSTEM WASH WATER:

A. System Components and Functions:
1. Screen Systems.
   a. See “Screen System” sub-section for description of operation, devices, and setpoints.
2. Heated Water Valves.
   a. GRSC-VLV-125.
   b. GRSC-VLV-225
   c. Three-way valves for supplying wash water to the screen systems' washer/compactors. The valves will switch wash water supply between heated potable water and un-heated process water.
3. Plant Control System GRSC-PLC-061.
   a. Controls the position of the heated wash water solenoid valves.

B. Description of Operation:
1. The heated water valves shall be capable of being controlled remotely by the plant control system.

2. Remote Control:
   a. When the heated water valves are in REMOTE control, opening and closing of the valves shall be controlled by the plant control system PLC.
   b. When the heated water valves are in REMOTE control, only one valve shall be open at a time.
   c. Remote Manual Control Mode:
      (1) Opening and closing of each of the heated water valves initiated by the operator at the PCS OIT or operator workstation.
   d. Remote Automatic Control Mode:
      (1) Remove Automatic Timer Control Mode:
         (a) Opening of each of the heated water valves initiated by the operator at the PCS OIT or operator workstation.
         (b) The plant control system PLC shall automatically close the valves based on a timer.
         (c) Sequence of Operation:
            1). The valve shall remain open for an adjustable number of hours prior to automatic closing of the valve. The timer shall be adjustable by the operator and initially set at 4 hours. The timer shall automatically reset if the valve is manually closed by the operator prior to automatic closing by the plant control system PLC.
            2). The timer for each valve shall not allow both valves to be open at the same time.
      (2) Remote Automatic Control Mode:
         (a) The plant control system PLC shall automatically open and close the heated water valves daily based on an adjustable schedule.
         (b) Sequence of Operation:
            1). GRSC-VLV-125 shall open at an adjustable time. The time shall be adjustable by the operator and initially set at 06:00.
            2). GRSC-VLV-125 shall close at an adjustable time. The time shall be adjustable by the operator and initially set at 10:00.
            3). GRSC-VLV-225 shall open at an adjustable time. The time shall be adjustable by the operator and initially set at 14:00.
            4). GRSC-VLV-225 shall close at an adjustable time. The time shall be adjustable by the operator and initially set at 18:00.
            5). The valves shall be rotated automatically by the PCS or manually by the operator. Selections shall be made available on the PCS OIT or operator workstation screen for this function.
            6). The schedule for each valve shall not allow both valves to be open at the same time.
   e. Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

C. Setpoints and Ranges:
   1. Heated Water Valves GRSC-VLV-125 and GRSC-VLV-225:
      (1) Heated water valve open and close.
   2. Operator Workstation:
      a. Timer Set Points:
         (1) Valve Open Delay (adjustable from 0-60 seconds) initially set at: 15 seconds.

(2) Valve Close time (adjustable from 0-24 hours) initially set at: 4 hours.

b. Schedule Set Points:

(1) GRSC-VLV-125 Open time (adjustable from 00:00-24:00) initially set at: 06:00.

(2) GRSC-VLV-125 Close time (adjustable from 00:00-24:00) initially set at: 10:00.

(3) GRSC-VLV-225 Open time (adjustable from 00:00-24:00) initially set at: 14:00.

(4) GRSC-VLV-225 Close time (adjustable from 00:00-24:00) initially set at: 18:00.

D. System Upsets and Procedures for Recovery:

1. If both valves are open at the same time, the system shall close the valve that was opened first and alarm the operator via the operator workstation.
2. Loss of open/close signal:
   a. If the open/close signal is lost or out of range, the system shall maintain the open/close status of the valve and alarm the operator via the operator workstation.

3.17 GRIT REMOVAL SYSTEM:

A. System Components and Functions:

1. Grit System Main Control Panel GRSC-MCP-300.
   a. Manufacturer provided control panel for control of the grit removal system containing starters, relays, circuit breakers, PLC, operator interface, and other ancillaries necessary for control of the equipment.
2. Stacked Tray Grit Removal System and associated Grit Pump GRSC-PMP-310.
   a. Designed to segregate particulate materials from the influent flow with grit pump to pump settled grit material for further classification and dewatering. Pump speed controlled by a Variable Frequency Drive.
3. Grit Washer Classifier and Conveyor GRSC-CONV-330.
   a. Designed to classify and dewater grit for discharge into a grit dumpster. Consists of the “Teacup”, and “Grit Snail” clarifier to settle and escalate grit from the clarifier pool. Grit conveyor “Snail” is speed controlled using a Variable Frequency Drive.
4. Influent Flow Transmitter: GRSC-FIT-001.
   a. Magnetic flow meter measures Influent Pump Station discharge flow.
   b. Communicated through the PCS Ethernet/IP network.
5. Grit Pump Flow Transmitter: GRSC-FIT-311.
   a. Magnetic flow meter measures Grit Pump discharge flow.
   b. Communicated through the PCS Ethernet/IP network.
6. Additional control valves required for this system are not described in this Section. Refer to P&IDs and manufacturer’s literature for a complete listing of equipment.

B. Description of Operation:

1. The manufacturer provided control panel shall be equipped with HAND/OFF/AUTO switches, status indicating lights, and fail indicating lights.
   a. When the switch is in the HAND position, the corresponding piece of equipment shall be started and stopped at the control panel or remotely mounted control station.
   b. When the switch is in the AUTO position the grit system shall be operated automatically by the grit system main control panel PLC as described by the manufacturer’s sequence of operation.

2. A DRY/WET/REMOTE selector switch shall be provided and include the following function:
    a. When the DRY mode is selected, the system shall operate using the manufacturer's automatic dry mode sequence.
    b. When the WET mode is selected, the system shall operate using the manufacturer's automatic wet mode sequence.
    c. When the REMOTE mode is selected, the system WET mode shall be initiated from the Plant Control System.
        (1) Plant Control System Wet Mode Initiation:
            (a) The Wet Mode shall be initiated by the plant control system via a Wet Mode Manual-Enable/Auto-Enable selection on the operator workstation screen.
                1). When the selection is Manual-Enable, the PCS shall enable the Grit System PLC wet mode bit through the communication network.
                2). When the selection is Auto-Enable, the PCS shall automatically enable the Grit System PLC wet mode bit when the plant flow reaches an operator adjustable setpoint.
    d. Additional Wet/Dry sequences shall be as described by the manufacturer's control sequence of operation.
3. The PCS shall provide an ENABLE/DISABLE permissive to the Grit System Main Control Panel PLC to prohibit the Grit Pump from operation during times of low plant flow.
    a. Provide a Grit System Enable/Disable Permissive selector switch on the operator workstation screen for Automatic and Manual functionality. The switch shall include three positions: "Auto", "Manual–Enable" and "Manual–Disable"
    b. Auto Mode:
        (1) The permissive shall be based on the Influent Flow Meter GRSC-FIT-001. The permissive shall remain enabled during normal flow conditions. If the flow is zero, the ENABLE permissive shall be removed.
4. The Grit Snail shall be equipped with a LOCAL/REMOTE selection for speed control and include the following function:
    a. When the switch is in the LOCAL position, the speed of the grit snail shall be set based on the potentiometer or OIT setpoint on the grit system main control panel.
    b. When the switch is in the REMOTE position, the speed of the grit snail shall be set based on the Plant Control System. An operator speed setpoint shall be provided for this function.
5. Refer to System Upsets and Procedures for Recovery Section for additional programming requirements.
6. The status points and alarms for the grit system shall be displayed on the operator workstation. Alarm and status points shall be communicated to the Plant Control System through the control system Ethernet network. Refer to the I/O list at the end of this Section and corresponding control drawings for I/O status and alarm points.

C. Setpoints and Ranges:
1. Operator Workstation:
    a. Wet Mode Flow Setpoint shall be adjustable, initially set at 9.0 MGD. Coordinate with Screen Continuous Run - High Flow setpoint this Section.

b. Grit Snail Speed Setpoint shall be adjustable, initially set based on manufacturer's startup recommendations.
(1) Range for speed setpoint shall have a limited range for minimum and maximum speeds. The range shall be as recommended by the manufacturer.

2. Additional manufacturer setpoints and ranges shall be adjustable at the grit system main control panel operator interface and shall be as recommended by the grit system manufacturer.

3.18 AGS SYSTEM:

A. System Components and Functions:
1. Equipment denoted with an "*" symbol is to be provided by the Granular Sludge Biological Treatment Package Equipment Supplier. Refer to Section 46 53 60 for additional equipment requirements.
2. AGS Main Control Panel AGS-MCP-001*.
a. Manufacturer provided control panel for control of the AGS system containing a PLC, operator interface, and other ancillaries necessary for control of the equipment.
3. AGS Nereda Controller AGS-SVR-001*:
a. Software based controller running on a host server located in the electrical room network rack.

B. Description of Operation:
1. Refer to Section 46 53 60 – Granular Sludge Biological Treatment Package for description of operation of the AGS System.

C. Setpoints and Ranges:
1. Manufacturer setpoints and ranges shall be adjustable at the AGS main control panel operator interface and shall be as recommended by the AGS manufacturer.

3.19 UV DISINFECTION SYSTEM:

A. System Components and Functions:
1. Flow Indicating Transmitter UV-FIT-301:
a. Radar flow transmitter for the effluent flume.
2. UV System Control Center UV-MCP-001:
a. Manufacturer provided control panel that provides control and operator interface for Channels No. 1 and No. 2 UV equipment.
3. UV System Power Distribution UV-LCP-110:
a. Manufacturer provided control panel that provides power distribution for the Channel No. 1 UV equipment.
4. UV System Power Distribution and Control Center UV-LCP-210:
a. Manufacturer provided control panel that provides power distribution for the Channel No. 2 UV equipment.
5. Channel No. 1 UV Module No.1A, Module No. 1B:
a. Provides UV disinfection to water flowing through Channel No. 1.
6. Channel No. 2 UV Module No.2A, Module No. 2B:
a. Provides UV disinfection to water flowing through Channel No. 2.
7. UV Transmittance Analyzer (UV-AIT-010):
a. Displays and transmits UVT to the plant control system PLC for the UV system influent.
b. UV-AE-011:

(1) UVT sensing probe for measuring the UV transmittance of the UV system influent. Connected to transmitter UV-AIT-010.

8. UV Channel No. 1 Low Level Switch (UV- LSL-101):
   a. Detects low water level in UV Channel No. 1.
9. UV Channel No. 2 Low Level Switch (UV- LSL-201):
   a. Detects low water level in UV Channel No. 2.
10. Plant Control System UV-PLC-061:
   a. Monitors the associated UV system equipment and provides effluent flow and UVT signals to the UV system PLC(s).

B. Effluent Flow Metering:
1. The effluent flow shall be measured by UV-FIT-301.
2. The flow signal shall be communicated to the UV system via the PCS.
3. Loss of signal alarms shall be programmed.
4. The flow shall be trended, totalized, and displayed on the PCS HMI screen.

C. Description of Operation
1. The UV system consists of a PDC control panel for each channel equipped with a PLC and operator interface terminal. The PDC(s) shall provide status and local control interface for the UV system. The PDC(s) shall monitor and control all equipment associated with the UV system.
2. The following description is supplemental to the manufacturer's standard operating description and provided to define basic operation of the UV system equipment and define interactions required with the plant control system. Refer to the UV system equipment specifications for additional requirements.
3. The Plant Control System shall provide a System Inhibit signal to the manufacturer provided control panel. The signal shall prevent operation of the UV system equipment.
4. The manufacturer provided PLC(s) shall be programmed to communicate the indicated and specified control and status points to the plant control system over the Ethernet/IP network. HMI screens shall be developed to display the control and status points.
5. UV Intensity:
   a. The UV intensity for each UV lamp bank shall be measured by the corresponding module intensity meter.
   b. The UV intensities shall be displayed in units of milliwatts per square centimeter on the operator HMI.
   c. The UV intensities shall be recorded to the historical database.
   d. The UV intensities shall be trended.
6. UV Lamps:
   a. The operation of the UV lamps shall be controlled by the associated UV control panel.
   b. Each UV control panel shall be equipped with a HAND/AUTO switch. When the switch is in the HAND position the UV system shall be started and stopped at the UV system control panel HMI. When the switch is in the AUTO position the UV system shall be started and stopped by the associated UV control panel PLC automatic sequence.
      (1) Hand Control:
         (a) The UV system shall be capable of being controlled manually or automatically from the operator interface terminal located on the face of the associated UV control panel.

1). Manual Control:
a). The operator shall start and stop the lamp banks manually and set the intensity of the lamp bank.
2). Automatic Control:
a). The UV control system shall automatically start and stop lamp banks and control the intensity of the UV lamps to provide the required dosing based upon the flow rate as measured by the effluent flow transmitter UV-FIT-301 and the UVT analyzer UV-AIT-010.
b). The flow rate pacing signal and UVT signal shall be communicated to the UV system PLC(s) through the plant control system network.
c). The UV control system shall automatically rotate the operation of the lamp banks to provide uniform lamp runtime for each of the banks. The time period between rotations shall be as recommended by the UV system manufacturer.

c. The associated status points, local/remote status, and failure alarms shall be displayed on the operator HMI and the plant control system operator workstation.
d. Refer to System Upsets and Procedures for Recovery for additional requirements.

D. Set Points and Ranges:
1. UV Intensity Transmitter(s):
a. Range as recommended by manufacturer.
2. Low Level Switches UV-LSL-101 and UV-LSL-201:
a. Set points shall be as recommended by manufacturer.
3. UVT Analyzer UV-AIT-010:
a. Range as recommended by manufacturer.
4. Operator HMI:
a. Display ranges and setpoints as recommended by manufacturer.
5. Operator Workstation:
a. Display ranges and setpoints as recommended by manufacturer.

E. System Upsets and Procedures for Recovery:
1. If the flow signal is lost, the control system shall alarm the operator via the operator HMI and operator workstation.
2. If a low water level is detected by the low level switch, the associated lamp banks shall be shut down and the control system shall alarm the operator via the operator HMI and operator workstation. If the water level rises, the system shall resume normal operation.
3. Automatic Mode:
A. If the flow signal is lost, the UV lamps shall go to full power output.

3.20 PROCESS WATER PUMP STATION:

A. System Components and Functions:
1. Process Water Pump No. 1: PW-PMP-110.
a. Vertical turbine pump controlled by a VFD.
2. Process Water Pump No. 1: PW-PMP-120.
a. Vertical turbine pump controlled by a VFD.
3. Process Water Pump No. 1: PW-PMP-130.
a. Vertical turbine pump controlled by a VFD.

4. Pressure Indicating Transmitters:
    a. PW-PIT-101
        (1) Pressure transmitter used for measuring the process water pumping header pressure upstream of the duplex strainer.
    b. PW-PIT-103
        (1) Pressure transmitter used for measuring the process water bladder tank pressure, downstream of the duplex strainer.
    c. GRSC-PIT-001
        (1) Pressure transmitter used for measuring the Headworks Building process water pressure.
    d. SPB-PIT-001
        (1) Pressure transmitter used for measuring the Solids Processing Building process water pressure.
5. Pressure Switches:
    a. GRSC-PSL-001
        (1) Low pressure switch used for alarm when Process Water pressure at Headworks Building is low.
    b. SPB-PSL-001
        (1) Low pressure switch used for alarm when Process Water pressure at Solids Processing Building is low.
6. Level Float Switches: Located in the process water wet well.
    a. PW-LSH-101.
        (1) High level float switch used for alarm.
    b. PW-LSL-101.
        (1) Low level float switch used for pump shut-down interlock and alarm.
7. Process Water Flow Transmitter: PW-FIT-101.
    a. Magnetic flow meter measures the pump station discharge flow to the Process Water System.
8. Plant Control System:
    a. UV-PLC-061.
        (1) Controls Process Water Pumps' starting, stopping, and speed while in remote mode.
    b. GRSC-PLC-061.
        (1) Monitors the Headworks Building process water pressure transmitter GRSC-PIT-001.
    c. SPB-PLC-061.
        (1) Monitors the Solids Processing Building process water pressure transmitter SPB-PIT-001.

B. Description of Operation:
1. Process Water Pump Station Flow:
    a. The pump station flow shall be measured by flow transmitter PW-FIT-101.
    b. The flow shall be displayed in gpm (gallons per minute) and MGD (million gallons per day) on the operator workstation.
    c. High flow, reverse flow, and loss of signal alarms shall be programmed.
    d. The pump station flow shall be trended.
2. Process Water Pump Station Pressure:
    a. The pump station header pressure shall be measured by pressure transmitter PW-PIT-101.

b. The pressure shall be displayed in psi on the operator workstation.
c. High pressure, low pressure, and loss of signal alarms shall be programmed.
d. The pump station pressure shall be trended.

3. Process Water Pumps:
   a. The pumps shall be capable of being controlled locally at the associated pump VFD or remotely by the plant control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
   b. Pressure control for the pumps shall be based on the signal from the Headworks Building or Solids Processing Buildings pressure transmitters.
   c. Local Control:
      (1) When the pumps are in LOCAL control, starting and stopping of the pumps and the speed of the pumps shall be controlled at the associated VFD.
   d. Remote Control:
      (1) When the pumps are in REMOTE control, starting and stopping of the pumps, and the speed of the pumps shall be controlled by the plant control system PLC.
      (2) When a run command associated with the pump is communicated to the VFD, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
      (3) HMI screens shall be developed to allow the operator to select from two modes of operation.
      (4) Remote Manual Control Mode:
         (a) Starting and stopping of each of the pumps initiated by the operator at the operator workstation.
         (b) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.
      (5) Remote Automatic (Operator Selected PIT) Control Mode:
         (a) The plant control system PLC shall automatically start and stop pumps and adjust the speed of the pumps to maintain the pressure set point referenced to the Headworks Building or Solids Processing Building.
            1). The referenced pressure rate shall be operator selected from one of the of the following Pump Control pressure transmitters:
               a). Headworks Building pressure transmitter GRSC-PIT-001.
               b). Solids Processing Building pressure transmitter SPB-PIT-001.
            2). The pump speed shall be controlled using a PID algorithm to maintain a Pressure Set Point at the measurement location selected.
            3). When a Pump Control pressure transmitter has been operator selected as the measurement reference, the selected transmitter shall control until the operator changes the control mode or selects another transmitter.
         (b) The pumps shall be rotated in a lead/lag/standby fashion automatically by the control system or manually by the operator. Selections shall be made available on the operator workstation screen for this function.
         (c) The pumps shall be alternated as Lead, Lag, and Standby automatically by the system after an operator adjustable time period and each time a

pump is stopped. The rotation timer shall automatically reset if the pumps rotate because of a pump shutdown. The rotation of pumps while any pumps are in operation shall not cause a loss of system pressure.

(d) Sequence of Operation:

1). When the system pressure falls below the Lead Pump Start Set Point, the Lead pump shall start. The pump speed shall be modulated to maintain the pressure set point.

2). If the Lead pump is operating at 100% speed and the pressure is below the Lag Pump Start set point, the Lag pump shall start after a Pump Start time delay. If the pressure rises above the Lag1 Start set point prior to the time delay expiration, the timer shall be reset.

3). When the Lag 1 pump is called to start, it shall ramp to 100% speed to match the Lead pump speed and the Lead pump and Lag pump speeds shall be modulated together to maintain the pressure set point.

4). If the Lead and Lag 1 pump combination is operating at the associated minimum speed set point and the pressure reaches the Pump Stop (Lag) set point, the Lead Pump shall ramp down to zero speed and shut down. The pump lead/lag role shall be rotated at this time.

a). The pumps shall automatically rotate for the lead pump position after each start/stop cycle or once every 24-hour time period, whichever occurs first. The rotation time shall be operator adjustable.

5). The Lead pump shall continue to modulate to achieve the pressure set point.

6). The Lead pump shall operate until the following Lead pump shutdown conditions are met:

a). All other pumps are off.

b). The Lead pump is running at the associated minimum speed.

c). The process water flow falls below the operator-adjustable Pump Stop (Lead, Flow) set point for an operator-adjustable timer OR the measured pressure rises above the operator adjustable Pump Stop (Lead, Pressure) set point for an operator-adjustable timer.

(e) Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

(6) Remote Automatic (Automatically Selected PIT) Control Mode:

(a) The plant control system PLC shall automatically start and stop pumps and adjust the speed of the pumps to maintain the pressure set point referenced to the Headworks Building or Solids Processing Building.

1). The referenced pressure rate shall be automatically selected from the lesser value of the following Pump Control pressure transmitters:

a). Headworks Building pressure transmitter GRSC-PIT-001.

b). Solids Processing Building pressure transmitter SPB-PIT-001.

2). The pump speed shall be controlled using a PID algorithm to maintain a Pressure Set Point at the measurement location with the lowest pressure value.

3). When a Pump Control pressure transmitter has been automatically selected as the measurement reference, the following checks shall prevent selection of another pressure transmitter:

a). An operator-adjustable Pressure Transmitter Selection timer shall prevent selection of a new pressure transmitter for the duration of the timer. The timer shall be reset after a new pressure transmitter has been selected.

b). An operator-adjustable Pressure Transmitter Selection dead-band shall prevent selection of a new pressure transmitter while both pressure transmitters are measuring within the dead-band range.

(b) The pumps shall be rotated in a lead/lag/standby fashion automatically by the control system or manually by the operator. Selections shall be made available on the operator workstation screen for this function.

(c) The pumps shall be alternated as Lead, Lag, and Standby automatically by the system after an operator adjustable time period and each time a pump is stopped. The rotation timer shall automatically reset if the pumps rotate because of a pump shutdown. The rotation of pumps while any pumps are in operation shall not cause a loss of system pressure.

(d) Sequence of Operation:

1). When the system pressure falls below the Lead Pump Start Set Point, the Lead pump shall start. The pump speed shall be modulated to maintain the pressure set point.

2). If the Lead pump is operating at 100% speed and the pressure is below the Lag Pump Start set point, the Lag pump shall start after a Pump Start time delay. If the pressure rises above the Lag1 Start set point prior to the time delay expiration, the timer shall be reset.

3). When the Lag 1 pump is called to start, it shall ramp to 100% speed to match the Lead pump speed and the Lead pump and Lag pump speeds shall be modulated together to maintain the pressure set point.

4). If the Lead and Lag 1 pump combination is operating at the associated minimum speed set point and the pressure reaches the Pump Stop (Lag) set point, the Lead Pump shall ramp down to zero speed and shut down. The pump lead/lag role shall be rotated at this time.

a). The pumps shall automatically rotate for the lead pump position after each start/stop cycle or once every 24-hour time period, whichever occurs first. The rotation time shall be operator adjustable.

5). The Lead pump shall continue to modulate to achieve the pressure set point.

6). The Lead pump shall operate until the following Lead pump shutdown conditions are met:

a). All other pumps are off.

b). The Lead pump is running at the associated minimum speed.
c). The process water flow falls below the operator-adjustable Pump Stop (Lead, Flow) set point for an operator-adjustable timer OR the measured pressure rises above the operator adjustable Pump Stop (Lead, Pressure) set point for an operator-adjustable timer.

(e) Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

e. The pump status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this section and corresponding control drawings for I/O status and alarm points.

C. Setpoints and Ranges:
1. Pressure Indicating Transmitters:
a. PW-PIT-101
(1) Refer to the instrument list for ranges.
b. GRSC-PIT-001
(1) Refer to the instrument list for ranges.
c. SPB-PIT-001
(1) Refer to the instrument list for ranges.
d. Pressure transmitters with integral displays.
e. Refer to Section 40 70 00 for instrument calibration ranges.
2. Process Water Pump Variable Frequency Drives:
a. Ramp up time: Adjustable setpoint initially set at 5 seconds.
b. Ramp down time: Adjustable setpoint initially set at 5 seconds.
c. Minimum Speed: 70% initial.
(1) Final setpoint shall be determined during system startup. Final setpoint shall be above the minimum continuous safe flow for the pump. Systems Integrator to coordinate with Contractor, Engineer, and pump Manufacturer accordingly.
3. Timer Set Points:
a. Pump Start Delay (adjustable) initially set at: 15 seconds.
b. Pump Rotation time (adjustable) initially set at: 24 hours.
c. Pump Stop (Lead, Flow) time (adjustable) initially set at: 5 seconds.
d. Pump Stop (Lead, Pressure) time (adjustable) initially set at: 5 seconds.
e. Pressure Transmitter Selection Delay (adjustable) time initially set at: 15 seconds.
4. Dead-Band Set Point:
a. Pressure Transmitter Selection Delay (adjustable) range initially set at: 5 psi.
5. Operator Workstation:
a. System Setpoints (adjustable over the range of the instruments):
(1) Lead Pump Start set point initially set at: 80 psig.
(2) Lag Pump Start set point initially set at: 75 psig.
(3) Pump Stop (Lead, Flow) set point initially set at: 55 gpm.
(4) Pump Stop (Lead, Pressure) set point initially set at: 100 psig.
(5) High-High Pressure Alarm (PW-PIT-101) initially set at: 155 psig.
(6) High Pressure Warning (PW-PIT-101) initially set at: 140 psig.
(7) Low Pressure Warning (PW-PIT-101) initially set at: 55 psig.
(8) High Pressure Warning (GRSC-PIT-001) initially set at: 90 psig.
(9) Low Pressure Warning (GRSC-PIT-001) initially set at: 50 psig.
(10) High Pressure Warning (SPB-PIT-001) initially set at: 90 psig.

(11) Low Pressure Warning (SPB-PIT-001) initially set at: 50 psig.
(12) High Flow Warning (PW-FIT-101) initially set at: 425 gpm.

b. Minimum Speed Setpoints:
(1) Pump Operating minimum speed: Initially set at 75%.

c. Flow Transmitter: PW-FIT-101.
(1) Display range of 0.0-695 gpm.
(2) Display range of 0.00-1.00 MGD for total flow.

D. System Upsets and Procedures for Recovery:
1. If a pump failure occurs, the control system shall alarm the operator via the operator workstation.
2. If a pressure signal is lost or out of range, the plant control system shall alarm the operator via the operator workstation.
3. If the flow signal is lost or out of range, the plant control system shall alarm the operator via the operator workstation.
4. If a low pressure is detected, the control system shall alarm the operator via the operator workstation.
5. If a high pressure is detected, the control system shall alarm the operator via the operator workstation.
6. If a high-high pressure is detected, the control system shall alarm the operator via the operator workstation.
7. If a low level is detected, the control system shall alarm the operator via the operator workstation.
8. If a high level is detected, the control system shall alarm the operator via the operator workstation.
9. If a reverse flow is detected, the control system shall alarm the operator via the operator workstation.
10. System in Remote Automatic control mode:
a. If a wet well low level is detected by the low level switch, all associated pumps shall be called to stop pumping. The process water pumps shall be allowed to run if the level switch returns to normal state and the alarm is cleared at the operator workstation.
b. If a high-high pressure is detected by any of the associated pressure transmitters, all associated pumps shall be called to stop pumping. The process water pumps shall be allowed to run if the pressure falls below the Pump Run (Lead) set point.
c. Loss of Pressure Signal:
(1) Operator Selected PIT mode:
(a) If GRSC-PIT-001 or SPB-PIT-001 signal is lost or out of range, , the system shall maintain the pumps at current speed and alarm the operator via the operator workstation.
(2) Automatically Selected PIT mode:
(a) If the automatically selected pressure signal is lost or out of range, the system shall select the secondary pressure transmitter as reference. If both Pump Control pressure signals are lost, the system shall refer to the pressure signal at the wet well (PW-PIT-001).
(b) If all Pump Control pressure signals are lost or out of range, the system shall maintain the pumps at current speed and alarm the operator via the operator workstation.

d. In the event the lead pump becomes unavailable, fails to start, or drops off-line, the next available pump in the starting sequence shall be automatically selected to operate as the lead pump. If a lag pump is unavailable, fails to start, or drops off-line the next pump in the starting sequence shall be automatically selected to operate as the lag pump.

3.21 THIN SLUDGE HOLDING TANKS AND SLUDGE BLOWERS:

A. System Components and Functions:
1. Plant Control System SPB-PLC-061.
a. Controls blowers' starting, stopping, and speed while in remote mode.
2. Thin Sludge Tanks:
a. Thin Sludge Tank No. 1
b. Thin Sludge Tank No. 2
c. Holds waste sludge pumped from AGS Sludge Buffer Tanks.
3. Sludge Blowers:
a. WAS-BLOW-410
(1) Associated with Thin Sludge Tank No. 1
b. WAS-BLOW-420
(1) Associated with either Thin Sludge Tank No. 1 or Thin Sludge Tank No. 2, dependent on position of manual blower valves and Operator selection at HMI.
c. WAS-BLOW-430
(1) Associated with Thin Sludge Tank No. 2
d. Positive displacement blowers controlled by variable speed drives. Aerates Thin Sludge Tanks No. 1 and No. 2.
4. Level Switch WAS-LSL-101
a. Provides a low level alarm for Thin Sludge Tank No. 1.
5. Level Switch WAS-LSH-101
a. Provides a high level alarm for Thin Sludge Tank No. 1.
6. Level Switch WAS-LSL-201
a. Provides a low level alarm for Thin Sludge Tank No. 2.
7. Level Switch WAS-LSH-201
a. Provides a high level alarm for Thin Sludge Tank No. 2.

B. Thin Sludge Tank Level Monitoring:
1. The sludge level of Thin Sludge Tank No. 1 shall be measured by WAS-LIT-101.
2. The sludge level of Thin Sludge Tank No. 2 shall be measured by WAS-LIT-201.
3. Loss of signal alarms shall be programmed.

C. Thin Sludge Tank Dissolved Oxygen (DO) Monitoring:
1. The dissolved oxygen of Thin Sludge Tank No. 1 shall be measured by analytical probe and controller WAS-AE-101 and WAS-AIT-101, respectively.
2. The dissolved oxygen of Thin Sludge Tank No. 2 shall be measured by analytical probe and controller WAS-AE-201 and WAS-AIT-201, respectively.
3. Loss of signal alarms shall be programmed.
4. The dissolved oxygen levels shall be trended.

D. Thin Sludge Tanks:
1. Each Thin Sludge Tank shall have the option to be placed out of service by operator selection on the PCS HMI screen.

a. A warning pop-up shall be programmed to ensure the operator has confirmed the manual valve changes for the selected tank being placed out of service. The pop-up shall read as follows:
   (1) Warning: Tank status change requires operator confirmation of manual valve positions for intended usage! Are valve positions correct (Yes) (No)?"
   (2) If "Yes" is selected the status change request shall be executed. If "No" is selected the status change request shall be ignored, and remain unchanged.

E. Sludge Blowers:
1. The blowers shall be capable of being controlled locally at the associated blower VFD or remotely by the plant control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
2. Level controls for the blowers shall be based on the signal from the thin sludge tank level transmitters.
3. Local Control:
   a. When the blowers are in LOCAL control, starting and stopping of the blowers and the speed of the blowers shall be controlled at the associated VFD.
4. Remote Control:
   a. When the blowers are in REMOTE control, starting and stopping of the blowers, and the speed of the blowers shall be controlled by the plant control system PLC, SPB-PLC-061.
   b. When a run command associated with the blower is communicated to the VFD, the corresponding blower shall start and run. When a stop command associated with the blower is communicated to the VFD, the corresponding blower shall stop.
   c. HMI screens shall be developed to allow the operator to select from the following modes of operation.
   d. Remote Manual Control Mode:
      (1) Starting and stopping of each of the blowers initiated by the operator at the PCS OIT or operator workstation.
      (2) The operator shall set the speed as a percentage of full speed for each of the VFD controlled blowers.
   e. Remote Automatic Control Mode:
      (1) The PCS shall automatically start and stop blowers and adjust the speed of the blowers in response to each blower's associated tank DO.
      (2) No more than one (1) blower shall be called to start at a time. An operator-adjustable timer shall elapse before the next blower will be allowed to start.
      (3) The blower speed shall be controlled using a PID algorithm to maintain a DO Setpoint.
      (4) Sequence of Operation:
         (a) If DO falls below the low DO setpoint, the associated blower shall start.
         (b) The blower shall modulate speed based on output of PID control, with a minimum run time of 10 minutes. The minimum run time shall be required for each blower regardless of the DO concentration.
         (c) If DO rises above the high DO setpoint, the associated blower shall stop.
         (d) If tank liquid level falls below the low level setpoint, the blower shall stop and not be allowed to start until level rises above the low level setpoint.
         (e) If the low level switch is proven low, the blower shall stop and not be allowed to start until the switch returns to normal state.

(f) While in DO control mode, the blowers shall not be idle for more than a 24-hour period regardless of the DO concentration. A timer shall be used to monitor the blower system off status. If the 24-hour timer elapses, the blower shall be started and operate for a minimum duration of 10 minutes. After the blower operates, the minimum cycle timer shall be reset.

(5) Sludge Blower No. 2 (WAS-BLOW-420) operation:

(a) The HMI screen shall allow the operator to select the tank with which the blower is associated. The allowable assignments shall be as previously defined in the System Components and Functions.

1). A warning pop-up shall be programmed to ensure the operator has confirmed the manual valve changes for the selected blower assignment. The pop-up shall read as follows:

a). Warning: Blower assignment change requires operator confirmation of manual valve positions for intended usage! Are valve positions correct (Yes) (No)?"

b). If "Yes" is selected the assignment change request shall be executed. If "No" is selected the assignment change request shall be ignored, and remain unchanged.

(b) When two (2) blowers are assigned to one (1) tank, the following automatic controls shall be additionally applicable to all other automatic operations.

1). The two (2) blowers shall be programmed in a Duty and Standby configuration.

2). The Duty blower shall run for an adjustable number of hours prior to automatic alternation of the blowers. The timer shall be adjustable by the operator and initially set at 168 hours. The blowers shall also rotate after each blower stop cycle. The rotation timer shall automatically reset if the blowers rotate because of a blower cycle.

3). The blowers shall be rotated automatically by the PCS or manually by the operator. Selections shall be made available on the PCS OIT or operator workstation screen for this function.

F. Setpoints and Ranges:

1. DO Transmitter WAS-AIT-101, WAS AIT-201:
   a. DO transmitter with integral display.
   b. Refer to Section 40 70 00 for instrument calibration ranges.
   c. Low-low DO alarm adjustable between 0-3 mg/L.
   d. Low DO adjustable between 0-3 mg/L.
   e. High DO adjustable between 0-10 mg/L.
   f. High-high level alarm adjustable between 0-10 mg/L.
2. Level Transmitter WAS-LIT-101, WAS-LIT-201:
   a. Level transmitter with integral and remote display.
   b. Refer to Section 40 70 00 for instrument calibration ranges.
   c. Low level alarm adjustable between 0-10 feet.
   d. Thin Sludge Pump Run adjustable between 0-48 hours.
   e. High level alarm adjustable between 0-23 feet.
3. Operator Workstation:

a. Display range of 0-10 mg/L for DO transmitters.
b. Display range of 0-23 feet for thin sludge tank levels.

G. System Upsets and Procedures for Recovery:
1. If a high-high DO is detected, the control system shall alarm the operator via the operator workstation.
2. If a low-low DO is detected, the control system shall alarm the operator via the operator workstation.
3. If a low liquid level is detected, the control system shall alarm the operator via the operator workstation.
4. If a high liquid level is detected, the control system shall alarm the operator via the operator workstation.
5. System in Remote Automatic control mode:
a. Loss of DO signal:
(1) If the DO signal is lost or out of range, the system shall maintain the blower speed and alarm the operator via the operator workstation.
b. In the event the Duty blower becomes unavailable, fails to start, or drops off-line, the Standy blower in the starting sequence shall be automatically selected to operate as the lead blower.

3.22 THIN SLUDGE PUMPS:

A. System Components and Functions:
1. Plant Control System SPB-PLC-061.
a. Controls Thin Sludge Pumps' starting, stopping, and speed while in remote mode.
2. Thin Sludge Pumps:
a. Thin Sludge Pump No. 1 WAS-PMP-310
(1) Associated with Pump Group No. 1
b. Thin Sludge Pump No. 2 WAS-PMP-320
(1) Associated with either Pump Group No. 1 or Pump Group No. 2, dependent on position of manual valves and Operator selection at HMI.
c. Thin Sludge Pump No. 3 WAS-PMP-330
(1) Associated with Pump Group No. 2
d. Positive displacement pumps located in the Solids Processing Building Process Room, controlled by variable speed drives. Supplies sludge from the Thin Sludge Tanks normally to the Sludge Thickening System skids or alternately to the Thickened Sludge Tanks.
3. Thin Sludge Tanks:
a. Thin Sludge Tank No. 1
b. Thin Sludge Tank No. 2
c. See "Thin Sludge Holding Tanks and Sludge Blowers" sub-section for description of operation, devices, and setpoints.
4. Sludge Thickening Systems:
a. Sludge Thickening System No. 1
(1) Associated with Pump Group No. 1
b. Sludge Thickening System No. 2
(1) Associated with Pump Group No. 2
c. See "Sludge Thickening System" sub-section for detailed description of operation, devices, and setpoints.
5. Thickened Sludge Tanks:

a. Thickened Sludge Tank No. 1
b. Thickened Sludge Tank No. 2
c. See "Thickened Sludge Holding Tanks and Sludge Loadout Pumps" sub-section for description of operation, devices, and setpoints.

B. Thin Sludge Pump Flow Metering:
1. The flow of Pump Group No. 1 to Sludge Thickening System No. 1 or the Thickened Sludge Tanks shall be measured by WAS-FIT-301.
2. The flow of Pump Group No. 2 to Sludge Thickening System No. 2 or the Thickened Sludge Tanks shall be measured by WAS-FIT-302.
3. Loss of signal alarms shall be programmed.
4. The flow shall be trended, totalized, and displayed on the PCS HMI screen.

C. Thin Sludge Pump Total Solids (TS) Metering:
1. The total solids of sludge pumped from Pump Group No. 1 to Sludge Thickening System No. 1 or the Thickened Sludge Tanks shall be measured by WAS-AIT-301.
2. The total solids of sludge pumped from Pump Group No. 2 to Sludge Thickening System No. 2 or the Thickened Sludge Tanks shall be measured by WAS-AIT-302.
3. Loss of signal alarms shall be programmed.
4. Total solids shall be trended and displayed on the PCS HMI screen.

D. Thin Sludge Pumps:
1. The pumps shall be capable of being controlled locally at the associated pump VFD or remotely by the plant control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
2. Flow controls for the pumps shall be based on the signal from the thin sludge pump flow meters.
3. Local Control:
a. When the pumps are in LOCAL control, starting and stopping of the pumps and the speed of the pumps shall be controlled at the associated VFD.
4. Remote Control:
a. When the pumps are in REMOTE control, starting and stopping of the pumps, and the speed of the pumps shall be controlled by the plant control system PLC, SPB-PLC-061.
b. When a run command associated with the pump is communicated to the VFD, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
c. HMI screens shall be developed to allow the operator to select from the following modes of operation.
d. Remote Manual Control Mode:
(1) Starting and stopping of each of the pumps initiated by the operator at the PCS OIT or operator workstation.
(2) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.
e. Remote Automatic Control Mode:
(1) For the following Remote Automatic control modes, the HMI screen shall allow the operator to select which pump groups are currently assigned to a particular function (i.e. Sludge Thickening Mode or Thickening Bypass Mode). The allowable assignments shall be as previously defined in the System Components and Functions.

(a) A warning pop-up shall be programmed to ensure the operator has confirmed the manual valve changes for the selected mode assignment. The pop-up shall read as follows:
1). Warning: Pump mode change requires operator confirmation of manual valve positions for intended usage! Are valve positions correct (Yes) (No)?"
2). If "Yes" is selected the mode change request shall be executed. If "No" is selected the mode change request shall be ignored, and remain unchanged.

(2) Remote Automatic Control (Sludge Thickening Mode):
(a) Each Sludge Thickening control system shall start and stop their associated thin sludge pump group and adjust the speed of the pump based on the operator input from the associated control panel operator interface settings as part of the Sludge Thickening System automatic sequence.
(b) The plant control system shall monitor the start/stop and speed control signals from each Sludge Thickening System control panel and communicate the required signals to the associated VFDs over the plant control system network.

(3) Remote Automatic Control (Thickening Bypass Mode):
(a) The plant control system shall start and stop the pump based on a start command, and the speed of the pump shall be controlled using a PID algorithm to maintain a Flow Rate Setpoint. The flow rate shall be manually set by the operator at the operator workstation.
(b) The control system shall be programmed to run the pump for an adjustable number of minutes. The timer shall be adjustable by the operator from the operator workstation and initially set at 60 minutes.
(c) The measured flow rate for Pump Group No. 1 shall be based on flow meter WAS-FIT-301 and shall be utilized for flow control.
(d) The measured flow rate for Pump Group No. 2 shall be based on flow meter WAS-FIT-302 and shall be utilized for flow control.
(e) Each flow rate shall be trended totalized, and each shall be displayed on the PCS HMI screen.

(4) Thin Sludge Pump No. 2 (WAS-PMP-320) operation:
(a) The HMI screen shall allow the operator to select the pump group with which the pump is associated. The allowable assignments shall be as previously defined in the System Components and Functions.
1). A warning pop-up shall be programmed to ensure the operator has confirmed the manual valve changes for the selected blower assignment. The pop-up shall read as follows:
a). Warning: Pump assignment change requires operator confirmation of manual valve positions for intended usage! Are valve positions correct (Yes) (No)?"
b). If "Yes" is selected the assignment change request shall be executed. If "No" is selected the assignment change request shall be ignored, and remain unchanged.

(b) When two (2) pumps are assigned to one (1) pump group, the following automatic controls shall be additionally applicable to all other automatic operations.
1). The two (2) pumps shall be programmed in a Duty and Standby configuration.
2). The Duty pump shall run for an adjustable number of hours prior to automatic alternation of the pumps. The timer shall be adjustable by the operator and initially set at 168 hours. The pumps shall also rotate after each pump stop cycle. The rotation timer shall automatically reset if the pumps rotate because of a pump cycle.
3). The pumps shall be rotated automatically by the PCS or manually by the operator. Selections shall be made available on the PCS OIT or operator workstation screen for this function.

E. Setpoints and Ranges:
1. Flow Meter WAS-FIT-301, WAS-FIT-302:
a. Flow meter with integral transmitter and reverse flow detection.
b. Refer to Section 40 70 00 for instrument calibration ranges.
2. Total Solids Analyzer WAS-AIT-301, WAS-AIT-302:
a. Total solids analyzer with integral transmitter.
b. Refer to Section 40 70 00 for instrument calibration ranges.
c. Low level alarm adjustable between 0-50,000 mg/L.
d. High level alarm adjustable between 0-50,000 mg/L.
3. Operator Workstation:
a. Display range of 0-500 gpm for flow meters.
b. Display range of 0-50,000 mg/L for total solids analyzers.
c. Thickening Bypass Mode timer adjustable between 1-480 minutes.

F. System Upsets and Procedures for Recovery:
1. If a low TS is detected, the control system shall alarm the operator via the operator workstation.
2. If a high TS is detected, the control system shall alarm the operator via the operator workstation.
3. If a reverse flow is detected, the control system shall alarm the operator via the operator workstation.
4. System in either Remote Automatic control mode:
a. If a low level is detected by either thin sludge tank level transmitter while the tank is in service, all thin sludge pumps shall be called to stop pumping. The thin sludge pumps shall be allowed to run when the level rises above the thin sludge run setpoint.
b. If a low level is detected by either thin sludge tank level switch while the tank is in service, all thin sludge pumps shall be called to stop pumping. The thin sludge pumps shall be allowed to run if the level switch returns to normal state and the alarm is cleared at the operator workstation.
c. In the event the Duty pump becomes unavailable, fails to start, or drops off-line, the Standby pump in the starting sequence shall be automatically selected to operate as the lead pump.
5. System in Remote Automatic (Sludge Thickening) control mode:

a. If a high level is detected by a pump group's associated Flocculation Tank high level switch, the pump shall immediately stop. The pump shall be allowed to start and run when the high level switch is in normal state.
b. If a high level is detected by a pump group's associated Sludge Thickening Hopper high level switch, the pump shall immediately stop. The pump shall be allowed to start and run when the high level switch is in normal state.

6. System in Remote Automatic (Thickening Bypass) control mode:
   a. If a high level is detected by either thickened sludge tank level transmitter while the tank is in service, the associated pump group(s) shall be called to stop pumping. The thin sludge pumps shall be allowed to run when the level falls below Thin and Thickened Sludge Pump Enable setpoint.
   b. If a high level is detected by either thickened sludge tank level switch while the tank is in service, all thin sludge pumps shall be called to stop pumping. The thin sludge pumps shall be allowed to run if the level switch returns to normal state and the alarm is cleared at the operator workstation.
   c. Loss of flow signal:
      (1) If the flow signal is lost or out of range, the system shall maintain the pump speed and alarm the operator via the operator workstation.

3.23 SLUDGE THICKENING SYSTEM:

A. System Components and Functions:
   1. Plant Control System SPB-PLC-061.
      a. Monitors and communicates all available I/O points to and from the Sludge Thickening Systems.
   2. Sludge Thickening Systems:
      a. Sludge Thickening System No. 1
         (1) Main Control Panel STH-MCP-100
         (2) Sludge Thickening Skid:
            (a) Flocculation Tank No. 1 STH-MIX-110
               1). Flocculation Tank High Level Switch STH-LSH-110
            (b) Rotary Drum Thickener No. 2 STH-RDT-120
               1). Discharge Hopper High Level Switch STH-LSH-120
               2). Discharge Hopper Level Sensor STH-LIT-120
      b. Sludge Thickening System No. 2
         (1) Main Control Panel STH-MCP-200
         (2) Sludge Thickening Skid:
            (a) Flocculation Tank No. 2 STH-MIX-210
               1). Flocculation Tank High Level Switch STH-LSH-210
            (b) Rotary Drum Thickener No. 2 STH-RDT-220
               1). Discharge Hopper High Level Switch STH-LSH-220
               2). Discharge Hopper Level Sensor STH-LIT-220
   3. Thin Sludge Pumps:
      a. Thin Sludge Pump No. 1 WAS-PMP-310
      b. Thin Sludge Pump No. 2 WAS-PMP-320
      c. Thin Sludge Pump No. 3 WAS-PMP-330
      d. See "Thin Sludge Pumps" sub-section for description of operation, devices, and setpoints.
   4. Thickened Sludge Pumps:

a. Thickened Sludge Pump No. 1 STH-PMP-130
b. Thickened Sludge Pump No. 2 STH-PMP-230
c. See "Thickened Sludge Pumps" sub-section for description of operation, devices, and setpoints.

5. Thickened Sludge Tanks:
   a. Thickened Sludge Tank No. 1
   b. Thickened Sludge Tank No. 2
   c. See "Thickened Sludge Holding Tanks and Sludge Loadout Pumps" sub-section for description of operation, devices, and setpoints.
6. Polymer Feed Systems:
   a. Polymer Feed System No. 1 POL-SKD-100
   b. Polymer Feed System No. 2 POL-SKD-200
   c. See "Polymer Feed Systems" sub-section for description of operation, devices, and setpoints.

B. Sludge Thickening System:
1. Refer to Section 46 71 33 – Rotary Drum Thickener for description of operation, devices, and setpoints of the Sludge Thickening System.
2. The plant control system shall provide a "Sludge Thickening System Inhibit" discrete I/O point over the PCS ethernet network for each sludge thickening system. If the inhibit point is active, the associate sludge thickening system shall not be allowed to run if in automatic mode.
3. Each Sludge Thickening control system shall start and stop their associated polymer feed system and adjust the speed of the polymer feed pump based on the operator input from the associated control panel operator interface settings as part of the Sludge Thickening System automatic sequence.
4. Each Sludge Thickening control system shall start and stop their associated thin sludge pump group and adjust the speed of the pump based on the operator input from the associated control panel operator interface settings as part of the Sludge Thickening System automatic sequence.
5. Each Sludge Thickening control system shall have option to start and stop their associated thickened sludge pump. The plant control system shall adjust the speed of the pump based on the discharge hopper level.
6. HMI screens shall be developed to allow the operator to monitor each sludge thickening system and inhibit each system from running.

C. System Upsets and Procedures for Recovery:
1. If a sludge thickening system's associated thickened sludge pump failure is detected or is stopped by the PCS, the thickened sludge system will be inhibited from running. The system will be allowed to run if the pump failure or PCS interrupt is cleared and the inhibit signal is not active.
2. If a sludge thickening system's associated thin sludge pump failure is detected or is stopped by the PCS, the thickened sludge system will be inhibited from running. The system will be allowed to run if the pump failure or PCS interrupt is cleared and the inhibit signal is not active.
3. If the thickened sludge system inhibit signal is initiated for any reason, the signal must be manually changed at the operator workstation to allow the thickened sludge system to run. I.e., an inhibit may be automatically activated by the PCS, but the signal may not be automatically deactivated.

4. If a sludge thickening system failure is detected, the plant control system shall perform the following functions:
    a. Stop the associated thin sludge pump.
    b. Stop the associated thickened sludge pump.
    c. Alarm the operator via the operator workstation.

3.24 POLYMER FEED SYSTEM:

A. System Components and Functions:
1. POL-SKD-100:
    a. Polymer Feed Pump No. 1-1 POL-PMP-110.
        (1) Manufacturer provided, skid mounted polymer feeder.
    b. Polymer Feed Pump No. 1-2 POL-PMP-120.
        (1) Manufacturer provided, skid mounted polymer feeder.
    c. Polymer Activation Chamber POL-MTR-115.
        (1) Manufacturer provided, skid mounted polymer activation chamber.
2. Polymer Feed Skid No. 2 POL-SKD-200
    a. Polymer Feed Pump No. 2-1 POL-PMP-210.
        (1) Manufacturer provided, skid mounted polymer feeder.
    b. Polymer Feed Pump No. 2-2 POL-PMP-220.
        (1) Manufacturer provided, skid mounted polymer feeder.
    c. Polymer Activation Chamber POL-MTR-215.
        (1) Manufacturer provided, skid mounted polymer activation chamber.
3. Plant Control System SPB-PLC-061.
    a. Calls for the associated polymer feed system to run while in remote mode and provides feed rate for the polymer feed system based on hard-wired or communicated inputs from the sludge thickening system PLCs.
4. Sludge Thickening Systems:
    a. Sludge Thickening System No. 1
    b. Sludge Thickening System No. 2
    c. See “Sludge Thickening System” sub-section for detailed description of operation, devices, and setpoints.

B. Description of Operation:
1. Polymer Feeder:
    a. Refer to Section 46 33 33 – Polymer Feed for description of operation, devices, and setpoints of the Polymer Feed System.
    b. The polymer feeder shall be capable of being controlled locally at the polymer feed control panel or remotely by the PLC when the LOCAL/OFF/REMOTE switch is in REMOTE.
    c. Local Control:
        (1) When the polymer feeder is in LOCAL control, starting, stopping, and polymer feed rate adjustment of the feeder shall be controlled at the local control panel.
    d. Remote Control:
        (1) When the polymer feeder is in REMOTE control, starting, stopping, and polymer feed rate adjustment of the feeder shall be controlled by the Sludge Thickening System via the PCS.

(2) The Sludge Thickening System shall provide start/stop signals and speed control signals to each polymer feeder. The PCS shall relay the Sludge Thickening System control signals to the Polymer Feed System.
(3) The operator shall select which Sludge Thickening System is associated with each Polymer Feed System on the HMI. This selection shall determine which Sludge Thickening System control signals are relayed to each Polymer Feed System via the PCS.
(4) When the start/stop contact associated with the polymer feeder is closed, the polymer feeder shall start. When the start/stop contact associated with the polymer feeder is opened, the polymer feeder shall stop.
(5) Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

e. The polymer feed system status points and alarms shall be displayed on the operator workstation and associated Sludge Thickening System control panel operator interface. Refer to the I/O list at the end of this Section and corresponding control drawings for I/O status and alarm points.

C. Setpoints and Ranges:
1. Operator Workstation:
a. Display range of 0.0 to 6.0 gal/hr for each polymer feeder.

D. System Upsets and Procedures for Recovery:
1. If a polymer feed system failure occurs, the control system shall alarm the operator via the operator workstation and the associated Sludge Thickening System control panel operator interface.

3.25 THICKENED SLUDGE PUMPS:

A. System Components and Functions:
1. Plant Control System SPB-PLC-061.
a. Controls Thickened Sludge Pumps' starting, stopping, and speed while in remote mode.
2. Thickened Sludge Pumps:
a. Thickened Sludge Pump No. 1 STH-PMP-130
(1) Associated with Sludge Thickening System No. 1
b. Thickened Sludge Pump No. 2 STH-PMP-230
(1) Associated with Sludge Thickening System No. 2
c. Progressive cavity pumps located in the Solids Processing Building Process Room, controlled by variable speed drives. Pumps sludge from the Sludge Thickening System hoppers to the Thickened Sludge Tanks.
3. Sludge Thickening Systems:
a. Sludge Thickening System No. 1
b. Sludge Thickening System No. 2
c. See "Sludge Thickening System" sub-section for detailed description of operation, devices, and setpoints.
4. Thickened Sludge Tanks:
a. Thickened Sludge Tank No. 1
b. Thickened Sludge Tank No. 2
c. See "Thickened Sludge Holding Tanks and Sludge Loadout Pumps" sub-section for description of operation, devices, and setpoints.

B. Thickened Sludge Pump Flow Metering:

1. The flow from Thickened Sludge Pump No. 1 to the Thickened Sludge Tanks shall be measured by STH-FIT-131.
2. The flow from Thickened Sludge Pump No. 2 to the Thickened Sludge Tanks shall be measured by STH-FIT-231.
3. Loss of signal alarms shall be programmed.
4. The flow shall be trended, totalized, and displayed on the PCS HMI screen.

C. Thickened Sludge Pump Total Solids (TS) Metering:
1. The total solids of sludge pumped from Thickened Sludge Pump No. 1 to the Thickened Sludge Tanks shall be measured by STH-AIT-131.
2. The total solids of sludge pumped from Thickened Sludge Pump No. 2 to the Thickened Sludge Tanks shall be measured by STH-AIT-231.
3. Loss of signal alarms shall be programmed.
4. Total solids shall be trended and displayed on the PCS HMI screen.

D. Thickened Sludge Pumps:
1. The pumps shall be capable of being controlled locally at the associated pump VFD or remotely by the plant control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
2. Level controls for the pumps shall be based on the signals from the sludge thickening systems' discharge hopper level transmitters.
3. Local Control:
   a. When the pumps are in LOCAL control, starting and stopping of the pumps and the speed of the pumps shall be controlled at the associated VFD.
4. Remote Control:
   a. When the pumps are in REMOTE control, starting and stopping of the pumps, and the speed of the pumps shall be controlled by the plant control system PLC or the associated Sludge Thickening System control panel.
   b. When a run command associated with the pump is communicated to the VFD, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
   c. HMI screens shall be developed to allow the operator to select from two modes of operation.
   d. The following I/O points will be read/write and able to be modified by the sludge thickening control system via ethernet communication.
      (1) Remote Manual Start.
      (2) Remote Auto Mode Initiate.
      (3) Pump Off.
      (4) Remote Manual Speed Control (0-100%).
   e. Remote Manual Control Mode:
      (1) Starting and stopping of each of the pumps initiated by the operator at the PCS OIT or operator workstation.
      (2) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.
   f. Remote Automatic Control Mode:
      (1) The plant control system PLC shall automatically start and stop pumps and adjust the speed of the pumps to maintain the thickened sludge hopper level setpoint.
      (2) The measured level for Thickened Sludge Pump No. 1 shall be based on level sensor STH-LIT-120 and shall be utilized for level control.

(3) The measured level for Thickened Sludge Pump No. 2 shall be based on level sensor STH-LIT-220 and shall be utilized for level control.
(4) The pump(s) speed shall be controlled using a PID algorithm to maintain a Level Setpoint.
(5) Sequence of Operation:
1). When the wet well level rises above the Pump Start set point, the pump shall start. The pump speed shall be modulated to maintain the level set point.
2). If the pump is operating at the associated minimum speed set point and the level reaches the Pump Stop set point, the pump shall ramp down to zero speed and shut down.
(b) Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.
g. The pump status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this section and corresponding control drawings for I/O status and alarm points.

E. Setpoints and Ranges:
1. Flow Meters STH-FIT-131, STH-FIT-231:
a. Flow meters with integral transmitter and reverse flow detection.
b. Refer to Section 40 70 00 for instrument calibration ranges.
2. Total Solids Analyzers STH-AIT-131, STH-AIT-231:
a. Total solids analyzers with integral transmitter.
b. Refer to Section 40 70 00 for instrument calibration ranges.
c. Low level alarm adjustable between HOLD.
d. High level alarm adjustable between HOLD.
3. Level Indicating Transmitters STH-LIT-120, STH-LIT-220:
a. Level transmitters with integral display.
b. Refer to Section 40 70 00 for instrument calibration ranges.
4. Thickened Sludge Pump Variable Frequency Drives:
a. Ramp up time: Adjustable setpoint initially set at 10 seconds.
b. Ramp down time: Adjustable setpoint initially set at 10 seconds.
c. Minimum Speed: 70% initial.
(1) Final setpoint shall be determined during system startup.
5. Operator Workstation:
a. Hopper Level Setpoints (Adjustable over the range of the instrument.), all relative to centerline of hopper level indicating transmitter:
(1) Zero level for the level transmitters shall be at elevation 0.00’.
(2) Pump Start set point initially set at: 1.25 feet.
(3) Pump Stop set point initially set at: 0.25 feet.
(4) High-High Level Alarm initially set at: 2.00 feet.
(5) High Level Warning initially set at: 1.75 feet.
(6) Low Level Warning initially set at: 0.00 feet.
b. Minimum Speed Setpoints:
(1) Pump Operating minimum speed: Initially set at 40%.
(2) Minimum pump speed setpoints shall be tested and confirmed during pump commissioning to ensure observed positive flow at minimum level setpoint conditions.
c. Display range of 0.0-12.0% TS for total solids analyzers.

d. Flow Transmitters STH-FIT-131, STH-FIT-231.
(1) Display range of 0.0-500 gpm.
(2) Display range of 0-500,000 gals for total flow.

F. System Upsets and Procedures for Recovery:
1. If a low TS is detected, the control system shall alarm the operator via the operator workstation.
2. If a high TS is detected, the control system shall alarm the operator via the operator workstation.
3. If a reverse flow is detected, the control system shall alarm the operator via the operator workstation.
4. System in Remote Automatic control mode:
a. If a high level is detected by either thickened sludge tank level transmitter while the tank is in service, the thickened sludge pumps shall be called to stop pumping. The pumps shall be allowed to run when the level falls below the Thin and Thickened Sludge Pump Enable set point.
b. If a high level is detected by either thickened sludge tank level switch while the tank is in service, the thickened sludge pumps shall be called to stop pumping. The pumps shall be allowed to run when the level switch returns to normal state and the alarm is cleared at the operator workstation.
c. If a low level is detected by the sludge thickening system hopper level sensor, the associated thickened sludge pump shall be called to stop pumping. The thickened sludge pump shall be allowed to run if the level returns to the Pump Run set point.
d. Loss of level signal:
(1) If the level signal is lost or out of range, the system shall maintain the pump speed and alarm the operator via the operator workstation.

3.26 THICKENED SLUDGE HOLDING TANKS AND SLUDGE MIXING AIR SYSTEM:

A. System Components and Functions:
1. Plant Control System SPB-PLC-061.
a. Monitors thickened sludge tanks level and statuses of sludge mixing air systems.
2. Thickened Sludge Tanks:
a. Thickened Sludge Tank No. 1
b. Thickened Sludge Tank No. 2
c. Holds thickened sludge pumped from the sludge thickening systems or thin sludge tanks.
3. Sludge Mixing Air Systems:
a. Sludge Mixing Air Compressors
(1) SCIN-AIRC-310
(2) SCIN-AIRC-320
b. Mixing Valve Panel
(1) SCIN-LCP-101
(a) Associated with Thickened Sludge Tank No. 1
(2) SCIN-LCP-201
(a) Associated with Thickened Sludge Tank No. 1
c. See Section 46 42 57 – Large Bubble Mixing System for description of operation, devices, and setpoints.
4. Thin Sludge Tanks:
a. Thin Sludge Tank No. 1

b. Thin Sludge Tank No. 2
c. See "Thin Sludge Holding Tanks and Sludge Blowers" sub-section for description of operation, devices, and setpoints.

5. Level Switch SCIN-LSH-101
   a. Provides a high level alarm for Thickened Sludge Tank No. 1.
6. Level Switch SCIN-LSH-201
   a. Provides a high level alarm for Thickened Sludge Tank No. 2.

B. Thickened Sludge Tank Level Monitoring:
1. The sludge level of Thickened Sludge Tank No. 1 shall be measured by SCIN-LIT-101.
2. The sludge level of Thickened Sludge Tank No. 2 shall be measured by SCIN-LIT-201.
3. Loss of signal alarms shall be programmed.

C. Thickened Sludge Tanks:
1. Each thickened sludge tank shall have the option to be placed out of service by operator selection on the PCS HMI screen.
   a. A warning pop-up shall be programmed to ensure the operator has confirmed the manual valve changes for the selected tank being placed out of service. The pop-up shall read as follows:
      (1) Warning: Tank status change requires operator confirmation of manual valve positions for intended usage! Are valve positions correct (Yes) (No)?"
      (2) If "Yes" is selected the status change request shall be executed. If "No" is selected the status change request shall be ignored, and remain unchanged.

D. Sludge Mixing Air Systems:
1. Controlled by unit-mounted local control panels.
2. Sludge Mixing Air Compressors' run statuses shall be monitored on the PCS HMI screen.

E. Setpoints and Ranges:
1. Level Transmitters SCIN-LIT-101, SCIN-LIT-201:
   a. Level transmitters with integral displays.
   b. Calibrated to a range of 0-23 feet.
   c. Low level alarm adjustable between 0-23 feet.
   d. High level alarm adjustable between 0-23 feet.
   e. Thin and Thickened Sludge Pump Enable adjustable between 0-5 feet.
2. Operator Workstation:
   a. Display range of 0-23 feet for level transmitters.

F. System Upsets and Procedures for Recovery:
1. If any components of the Sludge Mixing Air System fails, the plant control system shall alarm the operator via the operator workstation.
2. If the level signal is lost or out of range, the plant control system shall alarm the operator via the operator workstation.
3. If a high liquid level is detected, the control system shall alarm the operator via the operator workstation.

3.27 SLUDGE LOADOUT PUMPS:

A. System Components and Functions:
1. Plant Control System SPB-PLC-061.
   a. Controls Sludge Loadout Pumps' starting, stopping, and speed while in remote mode.
   b. Controls Recirculation and Loadout Valves opening and closing while in remote mode.

2. Sludge Loadout Pumps:
    a. Sludge Loadout Pump No. 1 SCIN-PMP-110
        (1) Associated with Thickened Sludge Holding Tank No. 1, Recirculation Valve SCIN-VLV-112, and Loadout Valve SCIN-VLV-113
    b. Sludge Loadout Pump No. 2 SCIN-PMP-210
        (1) Associated with Thickened Sludge Holding Tank No. 2, Recirculation Valve SCIN-VLV-212, and Loadout Valve SCIN-VLV-213
    c. Progressive cavity pumps located in the Solids Processing Building Process Room, controlled by reduced voltage soft starters. Supplies sludge from the Thickened Sludge Tanks to sludge transportation vehicles at the exterior of the Solids Processing Building.
3. Recirculation Valves:
    a. Recirculation Valve SCIN-VLV-112
        (1) Associated with Sludge Loadout Pump No. 1
    b. Recirculation Valve SCIN-VLV-212
        (1) Associated with Sludge Loadout Pump No. 2
    c. Modulating plug valves located in the Solids Processing Building Process Room, controlled by SPB-PLC-061. When opened, sludge from the Thickened Sludge Tanks is recirculated by pumping.
4. Loadout Valves:
    a. Loadout Valve SCIN-VLV-113
        (1) Associated with Sludge Loadout Pump No. 1
    b. Loadout Valve SCIN-VLV-213
        (1) Associated with Sludge Loadout Pump No. 2
    c. Modulating plug valves located in the Solids Processing Building Process Room, controlled by SPB-PLC-061. When opened, sludge is pumped from the Thickened Sludge Tanks to sludge transportation vehicles at the exterior of the Solids Processing Building.
5. Thickened Sludge Tanks:
    a. Thickened Sludge Tank No. 1
    b. Thickened Sludge Tank No. 2
    c. See “Thickened Sludge Holding Tanks and Sludge Loadout Pumps” sub-section for description of operation, devices, and setpoints.

B. Sludge Loadout Pump Flow Metering:
1. The flow of Sludge Loadout Pump No. 1 to the associated external loadout location shall be measured by SCIN-FIT-111.
2. The flow of Sludge Loadout Pump No. 2 to the associated external loadout location shall be measured by SCIN-FIT-211.
3. Provide a resettable flow totalizer for each loadout pump on the PCS HMI screen. When the associated reset button is pressed, the total flow shall be saved to Historian with the beginning and end dates and times of the totalization period.
    a. A Comments screen with a text field to be populated by the Operator will initiate after the reset button. The comment shall be saved with the total flow.
4. Provide an automatic flow totalizer for each loadout pump on the PCS HMI screen that is initiated with each automatic cycle of the associated loadout pump. When the automatic cycle is stopped, total flow shall be saved to Historian with the beginning and end dates and times of the automatic cycle.

a. A Comments screen with a text field to be populated by the Operator will initiate after the automatic cycle stops. The comment shall be saved with the total flow.

5. Loss of signal alarms shall be programmed.
6. The flow shall be trended and displayed on the PCS HMI screen.

C. Sludge Loadout Pumps:

1. The pumps shall be capable of being controlled locally at the associated pump control station or remotely by the plant control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
2. The LOCAL/OFF/REMOTE switch shall be located on the face of the associated RVSS enclosure.
3. Local Control:
   a. When the pumps are in LOCAL control, starting and stopping of the pumps shall be controlled at the associated interior control stations. Stopping of the pumps shall also be controlled from the exterior control stations.
4. Remote Control:
   a. When the pumps are in REMOTE control, starting and stopping of the pumps shall be controlled by the plant control system PLC.
   b. When a run command associated with the pump is communicated to the RVSS, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the RVSS, the corresponding pump shall stop.
   c. HMI screens shall be developed to allow the operator to select from two modes of operation.
   d. Remote Manual Control Mode:
      (1) Starting and stopping of each of the pumps initiated by the operator at the PCS OIT or operator workstation.
      (2) Opening and closing of the Recirculation and Loadout Valves initiated by the operator at the PCS OIT or operator workstation.
      (3) The operator shall set the valve position as a percentage of fully open for each of the valves.
   e. Remote Automatic Control Mode:
      (1) For the following Remote Automatic control modes, the HMI screen shall allow the operator to select which pumps are currently assigned to a particular function (i.e. Sludge Recirculation Mode or Sludge Loadout Mode).
      (2) If a sludge holding tank is placed out of service, the automatic control modes for the associated sludge loadout pump will not be available.
      (3) The associated Sludge Loadout Pump, Recirculation Valve, and Loadout Valve must be in Remote-Automatic mode for the automatic control mode to initiate. If any of the devices are switched out of Remote-Automatic mode during the cycle, the cycle shall end, and the pump shall be called to stop. Once the pump is proven to be stopped, the valves shall be called to close. The above cycle end procedures shall cease when all devices in Remote-Automatic mode have been proven stopped or closed.
      (4) Remote Automatic Control Mode (Sludge Recirculation Cycle):
         (a) The plant control system PLC shall automatically start and stop pumps and open and close valves according to operator adjustable timers and valve position setpoints.
         (b) Sequence of Operation:

1). When the Cycle Start button is selected on the PCS OIT, the cycle shall begin:
2). The Loadout Valve shall fully close.
3). With the Loadout Valve being proven closed, the Recirculation Valve shall open to the Recirculation Valve Open setpoint.
4). When the Recirculation Valve is proven open to the setpoint, the Sludge Loadout Pump shall start, and the Recirculation Cycle Run Timer shall start. The pump shall operate in this valve configuration until the timer has elapsed.
5). When the timer has elapsed, the pump shall stop. If the Cycle Stop button is selected at any time during the Automatic Recirculation Sequence, the pump shall stop.
6). When the pump has been proven stopped, the Recirculation Valve shall open to 100%.
7). All timers shall reset at the conclusion of each cycle.
8). Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

(c) Scheduled Sludge Recirculation Mode:
1). The plant control system shall include an option to schedule up to two (2) Sludge Recirculation Cycles which will initiate automatically without operator manual initiation. Each scheduled time shall be capable of being enabled or disabled through the PCS OIT.
2). The schedule shall include inputs for Start Time for each Sludge Recirculation Cycle.
3). The sequence of operation shall be similar to that described above, but with automatic initiation at the Start Time in lieu of selection of the Cycle Start button through the OIT.

(5) Remote Automatic Control Mode (Sludge Loadout Cycle):
(a) The plant control system PLC shall automatically start and stop pumps and open and close valves according to operator adjustable timers, valve position setpoints, and total flow setpoints.
(b) The measured flow rate for SCIN-PMP-110 shall be based on flow meter SCIN-FIT-111.
(c) The measured flow rate for SCIN-PMP-210 shall be based on flow meter SCIN-FIT-211.
(d) The PCS HMI screen shall indicate the state of the control sequence by displaying the current Step of Steps 1-3 as listed in the Sequence of Operation.
(e) Sequence of Operation:
a). When the Cycle Start button is selected on the PCS OIT, the cycle shall begin:
2). Loadout Step 1 – Recirculation:
a). The Loadout Valve shall fully close.
b). With the Loadout Valve being proven closed, the Recirculation Valve shall open to the Recirculation Valve Recirc position setpoint.

c). When the Recirculation Valve is proven open to the Recirculation Valve Recirc position setpoint, the Sludge Loadout Pump shall start and the Loadout Step 1 – Run Timer shall start. The pump shall operate in this valve configuration until the timer has elapsed.

3). Loadout Step 2 – Loadout:
   a). After the timer has elapsed, the Loadout Valve shall open to the Loadout Valve position setpoint.
   b). When the Loadout Valve is proven open to the setpoint, the Recirculation Valve shall modulate position to the Recirculation Valve Loadout position setpoint.
   c). The pump shall run in this valve configuration until the Total Loadout Flow setpoint has been met as reported by the associated flow meter.

4). Loadout Step 3 – Cycle Stop:
   a). When the Total Loadout Flow setpoint has been reached, the pump shall stop. If the Cycle Stop button is selected at any time during the Automatic Loadout Sequence, the pump shall stop.
   b). When the pump has been proven stopped, the Loadout Valve shall close and the Recirculation Valve shall open to 100%.

5). All timers shall reset at the conclusion of each cycle.
   a). Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

f. The pump and valve status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this section and corresponding control drawings for I/O status and alarm points.

D. Setpoints and Ranges:
1. Flow Meters SCIN-FIT-111, SCIN-FIT-211:
   a. Flow meters with integral transmitter, remote display, and reverse flow detection.
   b. Calibrated to a range of 0-1,000 gpm.
2. Operator Workstation:
   a. Display range of 0-1,000 gpm for flow meters.
3. Timer Set Points:
   a. Recirculation Cycle Run Timer (adjustable) initially set at: 60 seconds.
   b. Loadout Step 1 – Run Timer (adjustable) initially set at: 30 seconds.
4. Valve Position Set Points:
   a. Recirculation Valve in Recirculation (adjustable) initially set at: 100%.
   b. Recirculation Valve in Loadout (adjustable) initially set at: 0%.
   c. Loadout Valve (adjustable) initially set at: 100%.
5. Loadout Total Flow Set Point (adjustable) initially set at: 5,000 gallons.

E. System Upsets and Procedures for Recovery:
1. System in either Remote Automatic control mode:
   a. If a low level is detected by the associated thickened sludge tank level transmitter, the automatic cycle shall end. The sludge loadout pump shall be called to stop pumping. Once the pump is proven to be stopped, the valves shall be called to close. The automatic cycle shall be allowed to start when the level rises above the thickened sludge run setpoint.

2. System in Remote Automatic (Sludge Loadout) control mode:
    a. Loss of flow signal:
        (1) If the flow signal is lost or out of range, the automatic cycle shall end. The sludge loadout pump shall be called to stop pumping. Once the pump is proven to be stopped, the valves shall be called to close. The system shall alarm the operator via the operator workstation.

3.28 PLANT SEWER PUMP STATION:

A. System Components and Functions:
1. Plant Sewer Pump No. 1: PSEW-PMP-110.
    a. Submersible pump controlled by a VFD.
2. Plant Sewer Pump No. 2: PSEW-PMP-120.
    a. Submersible pump controlled by a VFD.
3. Level Indicating Transmitter: PSEW-LIT-101.
    a. Radar level transmitter used for measuring the plant sewer wet well level.
4. Level Float Switches: Located in the plant sewer wet well.
    a. PSEW-LSH-101.
        (1) High level float switch used for pump control interlock and warning.
    b. PSEW-LSHH-101.
        (1) High-high level float switch used for pump control interlock and alarm.
    c. PSEW-LSL-101.
        (1) Low level float switch used for pump control interlock and warning.
    d. PSEW-LSLL-101.
        (1) Low-low level float switch used for pump shut-down interlock and alarm.
5. Plant Sewer Flow Transmitter: PSEW-FIT-101.
    a. Magnetic flow meter measures the pump station discharge flow to the AGS System header.
6. Plant Control System GRSC-PLC-061.
    a. Controls Plant Sewer Pumps' starting, stopping, and speed while in remote mode.

B. Description of Operation:
1. Wet Well Level:
    a. The wet well levels shall be measured by level transmitter PSEW-LIT-101.
    b. The level shall be displayed on the operator workstation and high-high, high, low, and low-low level and loss of signal alarms shall be set. The level alarms shall be based upon the measurement from the selected transmitter.
    c. If a loss of signal alarm is detected the control system shall automatically switch to the other transmitter.
    d. The levels shall be displayed in feet to the nearest tenth on the operator workstation.
    e. The levels for both transmitters shall be trended.
2. Plant Sewer Pump Station Flow:
    a. The pump station flow shall be measured by flow transmitter PSEW-FIT-101.
    b. The flow shall be displayed in gpm (gallons per minute) and MGD (million gallons per day) on the operator workstation.
    c. High flow and loss of signal alarms shall be programmed.
    d. The pump station flow shall be trended.

3. Plant Sewer Pumps:
   a. The pumps shall be capable of being controlled locally at the associated pump VFD or remotely by the plant control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
   b. Level control for the pumps shall be based on the signal from the selected level transmitter.
   c. Local Control:
      (1) When the pumps are in LOCAL control, starting and stopping of the pumps and the speed of the pumps shall be controlled at the associated VFD.
   d. Remote Control:
      (1) When the pumps are in REMOTE control, starting and stopping of the pumps, and the speed of the pumps shall be controlled by the plant control system PLC.
      (2) When a run command associated with the pump is communicated to the VFD, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
      (3) HMI screens shall be developed to allow the operator to select from two modes of operation.
      (4) Remote Manual Control Mode:
         (a) Starting and stopping of each of the pumps initiated by the operator at the operator workstation.
         (b) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.
      (5) Remote Automatic Control Mode:
         (a) The plant control system PLC shall automatically start and stop pumps and adjust the speed of the pumps to maintain the level set point in the wet well.
         (b) The measured flow rate shall be based on the raw water flow meter PSEW-FIT-101 and shall be utilized for conditional peak flow control.
         (c) The pumps shall be rotated in a lead/lag fashion automatically by the control system or manually by the operator. Selections shall be made available on the operator workstation screen for this function.
         (d) The pumps shall be alternated as Duty and Standby automatically by the system after an operator adjustable time period and each time a pump is stopped. The rotation timer shall automatically reset if the pumps rotate because of a pump shutdown.
         (e) The pump speed shall be controlled using a PID algorithm to maintain a Level Set Point in the wet well.
         (f) Sequence of Operation (HOLD):
            1). When the wet well level rises above the Lead Pump Start, the Lead pump shall start. The pump speed shall be modulated to maintain the level set point.
            2). If the Lead pump is operating at 100% speed and the wet well level rises above the Lag Start set point, the Lag pump shall start after a Pump Start time delay. If the level falls below the Lag Start set point prior to the time delay expiration, the timer shall be reset.

3). When the Lag pump is called to start, it shall ramp to 100% speed to match the Lead pump speed and the Lead pump and Lag pump speeds shall be modulated together to maintain the level set point.
4). If the Lead and Lag pump combination is operating at the associated minimum speed set point and the level reaches the Pump Stop (Lag) set point, the Lead Pump shall ramp down to zero speed and shut down. The pump lead/lag role shall be rotated at this time.
a). The pumps shall automatically rotate for the lead pump position after each start/stop cycle or once every 24-hour time period, whichever occurs first. The rotation time shall be operator adjustable.
5). The Lead pump shall continue to modulate to achieve the level set point.
6). The Lead pump shall operate until the following Lead pump shutdown conditions are met:
a). All other pumps are off.
b). The Lead pump is running at the associated minimum speed.
c). The wet well level reaches the Pump Stop (Lead) set point.

(g) Point Level (Float Switch) Control Mode:
1). If the wet well level rises above the high level set point (PSEW-LSH-101), the Lead Pump shall start. The Lead pump shall run until the wet well level falls below the low level set point (PSEW-LSL-101)
2). If the wet well level rises above the high-high level set point (PSEW-LSHH-101), the Lag Pump shall start. The Lead and Lag pumps shall run until the wet well level falls below the low level set point (PSEW-LSL-101).
3). The pumps shall automatically rotate for the lead pump position after each start/stop cycle or once every 24-hour time period, whichever occurs first. The rotation time shall be operator adjustable.
4). All operational pumps will operate at 100% speed.

(6) Refer to System Upsets and Procedures for Recovery this Section for additional programming requirements.

e. The pump status points and alarms shall be displayed on the operator workstation. Refer to the I/O list at the end of this section and corresponding control drawings for I/O status and alarm points.

C. Setpoints and Ranges:
1. Level Indicating Transmitter PSEW-LIT-101:
a. Level transmitter with integral display.
b. Refer to Section 40 70 00 for instrument calibration ranges.
2. Plant Sewer Pump Variable Frequency Drives:
a. Ramp up time: Adjustable setpoint initially set at 10 seconds.
b. Ramp down time: Adjustable setpoint initially set at 10 seconds.
c. Minimum Speed: 70% initial.
(1) Final setpoint shall be determined during system startup.
3. Timer Set Points:

a. Pump Start Delay (adjustable) initially set at: 15 seconds.
b. Pump Rotation time (adjustable) initially set at: 24 hours.

4. Operator Workstation:
   a. Wet Well Level Setpoints (Adjustable over the range of the instrument.):
      (1) Zero level for the level transmitters shall be at elevation 893.00' msl.
      (2) Lead Pump Start set point initially set at: 4.00 feet (897.00' msl).
      (3) Lag Pump Start set point initially set at 7.00 feet (900.00' msl).
      (4) Lead Pump Stop set point initially set at: 2.00 feet (895.00' msl).
      (5) Lag Pump Stop set point initially set at: X.XX feet (X.XX' msl).
      (6) High-High Level Alarm initially set at: 8.00 feet (901.00' msl).
      (7) High Level Warning initially set at: 6.00 feet (899.00' msl).
      (8) Low Level Warning initially set at: 1.75 feet (894.75' msl).
      (9) Low Low Level Alarm initially set at 1.25 feet (894.25' msl).
   b. Minimum Speed Setpoints:
      (1) Pump Operating minimum speed: Initially set at 70%.
      (2) Minimum pump speed setpoints shall be tested and confirmed during pump commissioning to ensure observed positive flow at minimum level setpoint conditions.
   c. Flow Transmitter: PSEW-FIT-101.
      (1) Display range of 0.0-1,500 gpm.
      (2) Display range of 0.00-2.00 MGD for total flow.

D. System Upsets and Procedures for Recovery:
   1. If a pump failure occurs the control system shall alarm the operator via the operator workstation.
   2. If the primary level signal is lost or out of range, the plant control system shall alarm the operator via the operator workstation.
   3. If the flow signal is lost or out of range, the plant control system shall alarm the operator via the operator workstation.
   4. If a low-low level is detected, the control system shall alarm the operator via the operator workstation.
   5. If a low level is detected, the control system shall alarm the operator via the operator workstation.
   6. If a high level is detected, the control system shall alarm the operator via the operator workstation.
   7. If a high-high level is detected, the control system shall alarm the operator via the operator workstation.
   8. If a reverse flow is detected, the control system shall alarm the operator via the operator workstation.
   9. System in Remote Automatic control mode:
      a. If a low level signal is detected, all plant sewer pumps shall be called to stop pumping. The pumps shall be allowed to run when the level rises above the Lead Pump Start set point.
      b. If a low-low level signal is detected, all plant sewer pumps shall be called to stop pumping. The pumps shall be allowed to run when the level rises above the Lead Pump Start set point and the alarm is cleared at the operator workstation.
      c. Loss of Level Signal:

(1) If the level signal from the selected instrument is lost or out of range, the system shall maintain the pumps at current speed and alarm the operator via the operator workstation.
(2) In the event the lead pump becomes unavailable, fails to start, or drops off-line, the next available pump in the starting sequence shall be automatically selected to operate as the lead pump. If the lag pump is unavailable, fails to start, or drops off-line the system shall alarm the operator via the operator workstation..

3.29 SOLIDS HANDINLG ODOR CONTROL:

A. System Components and Functions:
1. Odor Control Main Control Panel ODR-MCP-100
a. Manufacturer provided control panel.

B. Odor Control:
a. Refer to Section 44 31 19 – Odor Control System for description of operation of the odor control system.
b. A system inhibit shall be provided to the main control panel PLC via the PCS network. If the inhibit is active, the odor control system shall be not be allowed to run.

3.30 ELECTRICAL SYSTEMS:

A. System Components and Functions:
1. Influent Pump Station:
a. Switchboard PRE-IPS-SWB-001.
(1) Service entrance switchboard with PLC based auto-throwover system (ATS). Located in the Electrical Building of the Influent Pump Station.
2. Wastewater Treatment Plant (Administration Building):
a. Switchboard BLGR-ADM-SWB-001.
(1) Service entrance switchboard with PLC based auto-throwover system (ATS). Located in the electrical room of the Administration Building.
3. Wastewater Treatment Plant (AGS):
a. Switchboard SEC-AGS-SWB-001.
(1) Service entrance switchboard with PLC based auto-throwover system (ATS). Located in the electrical room of the AGS Blower Building.
4. Refer to I/O list and drawings for additional electrical equipment, network equipment, and associated components to be monitored.

B. Description of Operation:
1. HMI screens shall be developed to display the status points for the monitored electrical equipment including auto-throwover switchboards, electronic power meters, UPS equipment, and network equipment as applicable.
2. In general power status, voltage, current, power, and power factor readings shall be displayed on the operator workstation for all network connected power distribution equipment. Analog points shall be trended.
3. Monitored statuses and all associated alarms shall be displayed on the operator workstation for the ATS components. Analog points shall be trended.

4. Power Failure Restart Sequence:
    a. When a power failure is detected at the switchboard ATS, the run commands for all motor starters and variable frequency drives that are being controlled by the plant control system shall be cleared.
        (1) Breaker statuses and nominal voltages shall be monitored to determine power availability.
    b. During a power failure all alarms generated by VFD's, PLC's, and associated equipment due to loss of power shall be programmed to automatically clear to prevent unnecessary interruption after emergency power becomes available or normal power has been restored.
    c. Influent Pump Station power restored:
        (1) If operating prior to the power failure in automatic mode, the following equipment/systems shall be restarted by the plant control system in the order indicated. Operator adjustable time delays shall be programmed between the enabling of the equipment to operate.
            (a) Step One Loads:
                1). General Plant Loads (Not Controllable): Lights, HVAC, Compressors, receptacle loads, etc.
            (b) Step Two Loads:
                1). Existing Screening System.
            (c) Step Three Loads:
                1). Influent Pumps.
                    a). No more than one pump shall be allowed to start simultaneously upon restart.
    d. Wastewater Treatment Plant (Administration Building) power restored:
        (1) If operating prior to the power failure in automatic mode, the following equipment/systems shall be restarted by the plant control system in the order indicated. Operator adjustable time delays shall be programmed between the enabling of the equipment to operate.
            (a) When power is restored to the plant, the following equipment controlled by manufacturer supplied control panels may automatically restart.
                a). Screening Systems.
                b). Grit System.
                c). UV System.
            (b) Step One Loads:
                1). General Plant Loads (Not Controllable): Lights, HVAC, Compressors, receptacle loads, etc.
            (c) Step Two Loads:
                1). Process Water Pump Station.
            (d) Step Three Loads:
                1). Plant Sewer Pump Station.
            (e) Step Four Loads:
                1). Thickened Sludge Pumps.
                2). Sludge Blowers.
    e. Wastewater Treatment Plant (AGS) power restored:
        (1) When power is restored, the equipment controlled by the manufacturer supplied control panel may be automatically started according to the AGS system sequence of operations.

f. Restart Time delays:
(1) HMI screens shall be developed to allow the time delays described for restart of equipment to be adjusted by a Supervisor. All restart time delays shall be adjustable from 0-600 seconds.

C. Setpoints and Ranges:
1. The following power meter status points and alarms shall be displayed on the Operator Workstation:
a. Display range of 0 to 125% of main trip rating (Amps).
b. Display range of 0-530 volts.
c. Coordinate with switchboard supplier for each power parameter (kW, kW-Hrs, VA, VAR, etc.) display ranges.
d. Low voltage alarm set for 465 volts, adjustable.
e. High voltage alarm set for 505 volts, adjustable.

D. Refer to the I/O list at the end of this section for all signals to be communicated and displayed at the Operator Workstation.

E. System Upsets and Procedures for Recovery:
1. If a power failure or switchboard ATS failure occurs, the control system shall alarm the operator via the operator workstation.

3.31 FIELD QUALITY CONTROLS:

A. Field Testing:
1. As specified in Section 40 60 00 – Process Control and instrumentation General Requirements and each applicable equipment Section.
2. A testing plan shall be developed and submitted for approval prior to testing of the control system.
3. Each mode of operation shall be tested along with fault conditions for proper system response.
4. Prior to and during initial startup period Systems Integrator shall demonstrate all modes of operation and step through various operating and failure scenarios.
a. Startup and operation mode testing shall be witnessed by the Engineer.
b. Contractor shall notify the Engineer a minimum of 2 weeks prior to the specified startup testing.

B. Test Reports:
1. Submit test reports as specified in Division 01.
2. Maintain a written record of all tests showing date, personnel making tests, equipment or material tested, tests performed, and results.

3.32 TRAINING:

A. The Systems Integrator shall provide formal training for operators, maintenance and service personnel.

B. The training session shall include classroom discussion on the theory of operation of the control system as well as maintenance and service methods for the system. Topics covered shall include functionality of the system, system navigation, data management and recommended backup procedures.

C. Operator Training Sessions:
1. Prior to the startup of the new control system a training session shall be provided for all operators. The training session shall clearly explain how to utilize the new system. HMI screens for the new system shall be presented and operators shall have the opportunity to

utilize the new system in a demonstration mode and navigate all the screens. The training session shall also explain and demonstrate customized features such as report generation, alarm review and acknowledgment procedures.

2. [Two] complete training session[s] for all specified training shall be provided for the operators [, one session for each shift].
3. [Two weeks after the control system is brought on line a 4 hour refresher training sessions shall be provided. The training session shall review the operations of the system and shall answer any questions the operators have developed on this system.]
4. [Two months after the completion of the project a 4 hour refresher training session shall be provided to review the operations of the entire plant control system and answer any questions operators have developed on the system.]
5. [Eleven months after the completion of the project a 4 hour refresher training session shall be provided to review the operations of the entire plant control system and answer any questions operators have developed on the system.]

D. Maintenance and Service Personnel Training:
   1. Prior to the startup of the new control system [three] [five] days of hands on training sessions shall be provided for all maintenance and service personnel. The training session shall include the following:
      a. Clearly explain the architecture of the new system and explain how the network is configured and managed. Personnel shall be trained on network switch programming troubleshooting and available diagnostic tools.
      b. Cover all system software operation and configuration.
      c. Introduce basic PLC programming and explain methods for troubleshooting and identifying system issues.
      d. Cover system hardware and functionality.
      e. Cover database management and trending.
      f. Cover report template creation and report generation.
      g. Cover I/O database management and modifications including how points are added to the control system and managed.
      h. Cover PLC programming layout and logic associated with the plant. Programming logic shall be reviewed with the Owner and explanations shall be provided on programming methodologies and how the programs are organized and notated.
      i. Programming comments and documentation shall be reviewed with the Owner to provide a clear understanding of how the system functions.
      j. Additional topics as required to provide Owner with the ability to manage, troubleshoot, modify and maintain the plant control system.
   2. Eleven months after the completion of the project a [two] day refresher training session shall be provided to review all of the topics covered in the original training session and answer any questions personnel have developed.

E. Contractor shall record the training sessions and provide a final edited version to the Owner in electronic video file format stored on a flash drive.

END OF SECTION 40 61 96

WWTP
I/O LIST

NOTES:

1. "SYSTEM" - POWER FROM ASSOCIATED PANEL. "FIELD" - POWER FROM OTHER SOURCE INDICATED ELSEWHERE.

2. PROVIDE SURGE PROTECTION DEVICE (SPD) FOR I/O POINT.

3. PROVIDE TEMPERATURE SWITCH INSTALLED IN THE PLC CABINET. SEE SPECIFICATIONS FOR REQUIREMENTS.

4. RANGE SHALL BE COORDINATED WITH THE EQUIPMENT SUPPLIER.

5. PROVIDE 120VAC POWER SOURCE FROM PLC PANEL FOR INSTRUMENT.

6. INDICATED POINTS SHALL BE CONSUMED BY THE PLANT CONTROL SYSTEM FROM THE MANUFACTURER SUPPLIED PLC.

7. INDICATED POINTS SHALL BE CONSUMED BY THE MANUFACTURER SUPPLIED PLC FROM THE PLANT CONTROL SYSTEM.

8. PROVIDE INTRINSICALLY SAFE BARRIER FOR I/O POINT.

9. WHERE ETHERNET/IP COMMUNICIATIONS IS NOT AVAILABLE, COMMS TO PCS SHALL BE UTILIZE SIMPLE NETWORK MANAGEMENT PROTOCOL (SNMP). UTILIZE SNMP TO OPC GATEWAY SOFTWARE AS REQUIRED.

10. PROVIDE AN INTERPOSING RELAY TO CONSUME THE INDICATED I/O POINT. SUPPLY VOLTAGE SHALL BE 24VDC SOURCED FROM THE ASSOCIATED PCS PLC CABINET.

SECTION 40 62 00 – COMPUTER SYSTEM HARDWARE AND ANCILLARIES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies computers and associated peripherals required for digital process control. This Section includes the following:
   1. Servers.
   2. Mobile Workstations (Laptops).
   3. Thin Client Terminals.
   4. Network Attached Storage.
   5. KVM Switches and Consoles.
   6. Printers.

1.03 RELATED REQUIREMENTS:

A. Section 26 33 53 – Static Uninterruptible Power Supply.
B. Section 40 61 96 – Process Control Software Programming and Reports.
C. Section 40 66 00 – Network and Communications Equipment.
D. Section 40 67 00 – Process Control Panels and Hardware.
E. Section 40 68 00 – Process Control Software.

1.04 REFERENCE STANDARDS:

A. The seller shall furnish Equipment which conforms in all respects to applicable industry standards and sound engineering practice.
B. Design, fabricate, assemble, install and test Equipment to conform to the applicable standards specified herein.
C. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
D. Code of Federal Regulations (CFR):
   1. Title 47 CFR, Part 15 – Radio Frequency Devices.
E. Institute of Electrical and Electronics Engineers (IEEE):
   1. IEEE C37.90.1 - Surge Withstand Capability Test.
F. National Fire Protection Association (NFPA):
   1. NFPA 70 - National Electrical Code (NEC).
G. Underwriters Laboratories (UL):
   1. UL 1449 - Safety for Surge Protective Devices.
H. Instrument Society of America (ISA).
I. National Electrical Safety Code (NESC).

1.05 SUBMITTALS:

A. Submit as specified in Division 1.
B. Product Data: Submit for each type of product specified and include the following as minimum:
   1. Device list and bills of material.
   2. Data sheets for all hardware and software.
   3. Description of operation for control Equipment.

C. Shop Drawings: Provide the following as minimum:
   1. Drawings of operator interface touch screen enclosures and mounting system.
D. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Information listed above.
   2. Commissioning test reports.
   3. Operation and maintenance manuals.
E. Maintenance Material Submittals:
   1. Spare Parts:
      a. Toner Cartridges: Provide one complete set of high-yield toner replacement cartridges for each laser printer supplied.
      b. Paper: Provide two reams (1000 sheets) of 8-1/2" x 11", 24lb, multi-purpose printing paper
   2. Software:
      a. Original electronic installation files on solid state drive or flash media containing all software provided. Associated licenses and license documentation shall be included.

1.06 QUALITY ASSURANCE:

A. All Equipment and Material furnished shall have an acceptable history of satisfactory reliable service in similar use for a period of at least six months.
B. Equivalent newly developed Equipment with less than two years actual service will be considered from established manufacturers if it has been adequately tested, meets the requirements of this Contract, and is approved by Engineer. Such Equipment shall be noted in the proposal for review.
C. All equipment shall be installed according to the respective NFPA 70 requirements.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Computers and peripherals shall be packaged and shipped to the project site to avoid damage.
B. All equipment shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install computers, peripherals, and other equipment specified herein until designated installation spaces are enclosed, weather tight, and free of contaminants.
B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to installation and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. Servers, Workstations, Laptops, and other computer equipment shall be provided with a minimum 3-year manufacturer's warranty. Warranty shall include 24x7 manufacturer's support and include next business day onsite service.
B. All other peripherals shall be provided with a minimum one-year warranty period.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Servers:
   1. Stratus Technologies.

B. PC Workstations and Mobile Workstations (Laptops):
   1. Hewlett-Packard Company (HP).
   2. Engineer-approved equal.
C. Thin Client Terminals:
   1. Allen-Bradley, Rockwell Automation, Inc.
   2. Engineer-approved equal.
D. Network Attached Storage:
   1. Synology Inc.
   2. Engineer-approved equal.
E. KVM Switches and Consoles:
   1. Hewlett-Packard Company (HP).
   2. Engineer-approved equal.
F. Multi-Function Laser Printers:
   1. Hewlett-Packard (HP).

2.02 PERFORMANCE AND DESIGN CRITERIA:

A. Contractor shall provide computer equipment and peripherals which meets the functional requirements of this PART 2.
B. The equipment shall be fully functional and compatible with the software and hardware as specified in Division 40.
C. Any device that does not meet IEEE C37.90.1 shall have a surge protection device that passes IEEE C37.90.1 and UL 1449.
D. Any device emitting an RF signal must meet CFR Title 47 CFR, Part 15.

2.03 PC WORKSTATIONS:

A. The processor shall be a 8 Core i7 11th generation series or AMD equivalent processor rated up to 4.9 GHz or greater. Processor shall have a minimum of 16.0 MBytes of cache.
B. Provide 16.0 Gigabytes (minimum), of Non-ECC DDR4 RAM designed to operate on a front side bus (FSB) speed of 1333 Mhz (2666 MT/s) or greater.
C. Provide at least three full-sized expansion slots.
D. Provide a minimum of 300-watt power supply.
E. Provide with standard keyboard.
F. Provide a wireless three-button, scroll wheel, optical mouse with “nano” USB receiver and mouse pad with each computer.
G. Graphics Card:
   1. Dedicated processor with a minimum of 4.0 GBytes of on-board GDDR5 or GDDR6 RAM.
   2. Shall support digital resolutions up to 3840 x 2160 at 60Hz or greater.
   3. The card shall have support a minimum of four displays and have the necessary DP and HDMI output ports.
   4. The graphics card shall be PCI Express 3.0 compliant.
H. Storage Drives:
   1. Provide a hard drive controller capable of supporting at least two SATA drives (up to 6.0Gbit/s minimum).
   2. Provide one internal SATA III type hard drive to meet the following requirements:
      a. Solid-state drive (SSD) with a minimum capacity of 512 GB.
      b. Sequential read up to 550MB/sec and Sequential write up to 520MB/sec.
      c. 2.5-inch or M.2 PCIe form factor.

I. Audio:
   1. The system shall include an integrated audio card supporting analog 2-channel and digital 5.1-channel outputs.
   2. 3.5mm audio output jack.
   3. Shall include a 3.5mm stereo or mono microphone input.

J. External ports shall include the following as minimum:
   1. Six (6) USB 3.0 ports. A minimum of two USB port shall be accessible on the front of the system chassis.

K. Provide an all-in-one flash card reader supporting a minimum of SD, CF, MMC, Memory Stick, and XD flash cards. Interface shall be mounted on the front of the system chassis.

L. Provide Ethernet 10/100/1000 gigabit Base-T network interface card with a single-shield RJ-45 connector.

M. Operating System and Software:
   1. Provide Microsoft Windows 11 Professional Edition for each PC workstation.
      a. The Operating System shall have the latest service packs and patches required for proper operation of the workstation and control software. Provide the OS license documentation as part of the workstation package.
      b. The PC shall have a clean install of the operating system and essential hardware drivers and software only. Non-essential applications, such as manufacturer provided trial software and utilities, shall not be loaded on the system.
   2. Provide a copy of the latest version of Microsoft Office (including Microsoft Word, Excel, and Access) for each PC workstation.
   3. The operating system shall include integrated firewall, virus, spyware, and malicious software protection.
   4. Provide and install the latest edition of Adobe Acrobat Professional.
   5. All software shall be licensed to the Owner. Coordinate with the Owner for specific contact information.

2.04 SERVERS:

A. Servers for the plant control system as specified below. Servers dedicated to the biological treatment system shall be as specified in the associated equipment specification section.

B. The host servers shall be fault tolerant (ft), Stratus Server 6910 series. Servers shall be included with a minimum of 5 year warranty and "Total Assurance" support with active remote fault notification.

C. The servers shall be rack mounted and provided with sliding rack rails.
   1. The processor shall be a 10-core Intel Xeon or equivalent AMD processor rated at 2.2 GHz or greater. The processor shall have a minimum of 15 Mbytes of Cache.
   2. Provide 128 Gigabytes (minimum) of registered ECC, DDR4 RAM (RDIMMS) designed to operate on a front side bus (FSB) speed of 1333 MHz (2666 MT/s) or greater.
   3. Provide at least four spare PCIe adapter slots for future expansion.
   4. Provide a minimum of two fully rated power supplies for redundant operation.
   5. Provide with a minimum dual on-board 10/100/1000 Base-T network interface card per CRU. The dual NIC card shall be configurable to serve as a primary and secondary fail-over.
   6. Hot-swappable components shall include CPU, I/O modules, and storage drives.

D. The graphics card shall be integrated with a minimum of 16 MB of video memory.

E. Disk Drives:
   1. Provide a system capable of supporting at least eight small form factor hot-swappable SAS hard drives per CRU. Support bandwidth of 12.0 Gb/s (SAS-3).

2. Total system storage capacity shall be a minimum of 2.4TB.
3. Provide a minimum of eight (8) hot swappable hard drives to meet the following requirements:
   a. Formatted capacity of 300GB or greater.
   b. Rotational speed of 15,000 rpm or greater.
   c. An average seek time of 3.5 msec or faster.
   d. Cache size of 256MB or greater.
   e. The hard drives shall be configured as a RAID 5.

F. Operating System and Software:
1. Provide Microsoft Windows Server 2019 with Hyper-V virtualization as required. Provide and install the latest service packs and patches available that are compatible with the control system software.
2. Configure the Operating System to allow all control software full access to communication ports as required.
3. The Owner shall provide the necessary Remote Desktop Services (RDS) client access licenses (CAL's) and Microsoft Office application licenses for each server. Integrator shall coordinate with the Owner's IT for specific license counts required.
4. All software provided shall be licensed to the Owner. Coordinate with the Owner for specific contact information.

2.05 THIN CLIENT TERMINALS:

A. Provide industrial grade thin client terminals, optimized for ACP ThinManager.
B. The processor shall be a 4-core AMD Ryzen or equivalent processor rated at 2.0Ghz or greater.
C. Provide 4.0 Gigabytes (minimum) of DDR4 RAM designed to operate on a front side bus (FSB) speed of 1333 MHz (2666 MT/s) or greater.
D. Support M.2 and 2.5" HDD/SSD storage devices.
E. Minimum of one full size mPCIe socket.
F. Graphics processor shall be Radeon Vega 8 or equivalent multi-display type supporting up to four monitors. Provide resolutions up to 4096 x 2160 at 60Hz or greater.
G. External ports shall include the following as minimum:
1. 4- DisplayPort 1.3/DP+ ports.
2. 2- Gb LAN ports.
3. 2- USB 3.2 Gen 2 ports.
4. 2- USB 2.0 ports.
5. 2- RS-232/422/485 COM ports.

H. Enclosure shall be aluminum or steel with fanned cooling. Operational temperature range of 0-50°C.
I. Designed to operate on an ACP ThinManager 13 or greater operating system.
J. Powered from 12Vdc. Provide required power supply adapter.
K. Provide standard keyboard and optical mouse.
L. Shall support up to 6 monitors as minimum. Workstation monitors and large displays shall be as specified this section.
M. Provide panel mount touch screen displays when required for control panels. Coordinate with Section 40 67 00.
N. Rockwell 6200 Versaview 5200 non-display series or equal.

2.06 WORKSTATION MONITORS:

A. Provide 24-inch widescreen (16:9) LCD displays as minimum. Quantity shall be as indicated.
B. LCD monitor shall be LED backlit.

C. Contrast Ratio of 1,000:1 (typical) as minimum.
D. Brightness of 250 nits (cd/m2), minimum.
E. Pixel pitch of 0.275 mm, maximum.
F. Minimum response time of 5ms with an average of 8ms.
G. Viewing angle (horizontal and vertical) of 170 degrees minimum.
H. Support resolution of 1980 x 1080 at 60 hertz, minimum.
I. Monitors shall include VESA mounting capabilities.
J. Shall include DisplayPort and HDMI inputs. Provide the required interconnecting cables between graphic card and monitor.
K. Shall include a minimum of 2- USB 3.2 Gen2 Type B and a minimum of 2 USB-C ports (1-upstream and 1-downstream) ports.

2.07 LARGE DISPLAY MONITORS (UHDTV):

A. Provide 65-inch widescreen (16:9) LCD HDTV monitors. Quantity shall be as indicated.
B. HDTV monitor shall be LED backlit.
C. Static Contrast Ratio of 5,000:1 minimum.
D. Brightness of 1000 nits (cd/m2), minimum.
E. Pixel pitch of 0.5 mm, maximum.
F. Response time of 5ms, maximum.
G. Viewing angle (horizontal and vertical) of 140 degrees minimum.
H. Support resolutions of 3840 x 2160 (2160p / 4K) at 60 hertz refresh rate, minimum.
I. Video inputs shall include the following as minimum:
    1. 3 – HDMI.
    2. 2 – USB 2.0 or greater.
    3. 1 – Coaxial F-type female.
    4. 1 – RJ-45 LAN port.
J. Monitors shall include VESA wall mounting capabilities.
K. Provide required interconnecting cables and video extension hardware between the graphic card and UHDTV monitors. Video extension hardware shall support full resolution specified.
L. Provide articulating wall mounting hardware or suspended ceiling mounting for each monitor as indicated. Mounting hardware shall be VESA compatible and rated to support the HDTV supplied. Coordinate overall dimensions of supplied display with the available mounting space shown on the Contract Drawings.

2.08 BADGE SCANNERS:

A. Each Engineering Workstation and Thin Client shall be provided with an RFID badge scanner. The badge scanner shall be configured to allow the operators to log onto the workstation or thin client by swiping their Owner-provided RFID. User verification shall come from the SCADA Active Directory. Badge scanners shall be manufactured by Lenel S2, without exception. Coordinate with security system hardware provider.

2.09 NETWORK ATTACHED STORAGE:

A. Provide rack mounted network attached storage (NAS) devices for connection to the plant control system network. The NAS devices shall be used for routine server backups and centralized file sharing:
B. NAS shall have a minimum AMD Ryzen 4-core 2.2 GHz processor with 16.0 GB DDR4 onboard system memory. 4 SO-DIMM slots with memory expandable to 32GB or greater.
C. Each storage controller shall have a minimum of six drive bays and be compatible with 2.5" and 3.5" SATA(II)/SATA(III) drives.

D. Screwless drive bay design with hot-swappable support.
E. Supported RAID types shall include RAID 0 and RAID 1.
F. Unit shall be provided with six (6) 10-TByte SATA drives. Drives shall be Seagate Ironwolf NAS series or equivalent.
G. NAS shall include a minimum of two gigabit Ethernet (RJ-45) ports with failover and link aggregation support.
H. Additional external ports shall include the following as minimum:
    1. Two (2) – USB 3.2 Gen 1.
    2. One (1) – eSATA.
    3. One (1) – VGA/Console.
I. Provide the required interconnection cables, power supplies, and rack mount rails.
J. Backup Software:
    1. Provide the necessary backup management software and install on appropriate server(s) for use with the NAS devices.

2.10 CONSOLE KVM SWITCH:

A. Integrated KVM and console shall provide control of multiple servers from a single keyboard, monitor, and touchpad.
B. Console shall provide 8-port KVM switch, 19” LCD, keyboard, and touchpad in a single 1U rack mountable chassis.
C. Support USB keyboard and mouse connections as required.
D. Support video resolutions up to 1280 x 1024.
E. Indicators for power and selected CPU.
F. CPU selection via face mounted pushbuttons or switches.
G. Shall include an external USB port for sharing a USB peripheral among all ports on the KVM switch.
H. Provide all required cables for complete installation.
I. Provide HPE Advanced KVM with LCD8500 rackmount console kit or engineer-approved equal.

2.11 MULTI-FUNCTION LASER PRINTER (COLOR):

A. Provide a multi-function laser printer (copy/scan/fax/print) as required.
B. General Requirements:
    1. The multi-function printer shall utilize color laser technology with copy and print speeds of 28 pages per minute (ppm) minimum.
    2. Support resolutions of 3600 dots per inch (dpi).
    3. Paper size capability of standard letter format 8 1/2" x 11" and standard legal format of 8 1/2" x 14".
    4. 512MB of internal RAM as minimum.
    5. Shall be capable of automatic duplex handling in all modes.
    6. Include Automatic Document Feeder with a 50 page capacity, minimum.
    7. Programming shall be accomplished by integral touchscreen display or PC software interface.
C. Fax Capabilities:
    1. 33.6kbps modem.
    2. Include a minimum of 100 Auto Dial and Memory locations.
    3. Minimum of 500-page fax memory.
    4. Support all standard faxing functions.

D. Scan Capabilities:
   1. Support B/W and Color scanning.
   2. Optical Scan Resolution of 600 dpi.
   3. Input color scan bit depth of 48-bit.
E. Interfaces shall include the following as minimum:
   1. Ethernet 10/100/1000 Base-TX. Provided with integral RJ-45 connector.
   2. USB 2.0 minimum.
   3. Wireless 802.11 b/g/n/2.4/5Ghz.
F. Each printer shall be provided with the required power supply and associated cables for network and PC connectivity.
G. Provide HP Color LaserJet Pro MFP M479fdw or Engineer-approved equal.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment. The area for installation shall be fully enclosed, weather tight, and free of contaminants.
B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to installation and shall be maintained for the remainder of the construction period.

3.02 INSTALLATION:

A. Operator Workstations:
   1. Mount Workstations on desktop, shelf, or floor surface as indicated and specified.
   2. Provide all necessary hardware and interconnecting cables to install Equipment where specified.
   3. Install all software and drivers as required to configure the PC Workstation. Verify that all associated peripherals are functioning properly.
   4. All cabling shall be neatly routed and tie wrapped.
   5. Configure all network interfaces and Ethernet configuration settings as required for network printers and shared server file space.
B. Servers:
   1. Mount Servers in equipment racks as indicated and specified.
   2. Provide and install server rack rails and other mounting hardware as required for proper installation.
   3. Configure Servers and setup all network interfaces.
   4. Setup the network domain, add users, and configure privileges as required by the Owner. Coordinate with Owner IT department as necessary.
   5. Setup a common shared folder on the server drives and provide workstation mapping as required for a general use file storage area for the PCS and reporting software.
   6. Install the necessary HMI system software, backup software, and other third-party software as required for the plant control system.
C. Thin Client Terminals:
   1. Desk Mounted:
      a. Mount client chassis below desktop with stainless steel hardware. If desk mounted, coordinate with Owner for preferred location. Monitors, keyboard, and mouse shall be located on the desktop.
   2. Panel Mounted:
      a. Coordinate with Section 40 67 00 – Process Control Panels and Hardware.

b. Install touchscreen in door of panel.
c. Coordinate with panel supplier for mounting of touchscreen and thin client terminal.

D. Network Attached Storage (NAS):
1. Mount the NAS units in the network rack and make the necessary Ethernet connections to the associated network switch.
2. After all servers are operational and properly configured provide a complete partition image backup of the server drives for permanent storage.
3. Program the installed backup software to perform routine bi-weekly, weekly, and monthly backups of the servers to the network attached storage.
4. Coordinate with Owner's IT Department for preferred backup intervals and content.

E. Printers:
1. Install the printers at designated location. Coordinate with Owner's representative for final location of printer when not indicated or specified.
2. Provide all necessary hardware and interconnecting cables to install Equipment where indicated.
3. Install laser toner cartridges and perform printer startup and configuration per manufacturer instructions.
4. Adjust paper delivery and storage shelves for smooth operation.
5. Printers shall be connected to the Ethernet network and shared within the network domain as required.
6. Install the required network printer drivers on all servers, workstations, and laptops.

F. Equipment Asset Tags:
1. Provide and affix asset tags to all of the supplied computer hardware and other equipment specified in this Section. Asset tag shall be as specified or indicated.

3.03 ADJUSTING AND CLEANING:

A. All cables for peripheral and network connections shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.
B. Prior to final acceptance all computers, servers, network racks and associated equipment shall be wiped clean and free from dust.
C. If equipment interiors have been exposed to dust and other contaminates the Contractor shall provide the necessary interior cleaning of equipment. Use precaution and proper cleaning methods to avoid damage of equipment.

3.04 TRAINING:

A. The training session shall be of sufficient content and duration to provide a basic understanding of the hardware/software in general and specific instruction on the Site-specific implementation.
B. Training for equipment specified in this section shall be a minimum of 4 hours in duration. The training sessions shall be coordinated with Owner and Engineer.
A. Additional training shall be provided as specified in Section 40 61 96 – Process Control Software Programming and Reports.
B. Training shall conform to the requirements of Section 01664 – Training.

END OF SECTION 40 62 00

SECTION 40 66 00 – PROCESS CONTROL NETWORKS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section specifies network infrastructure, wireless equipment, and ancillaries for Process Control System (PCS) networks and Supervisory Control and Data Acquisition (SCADA) systems. This Section includes the following:
   1. Fiber Optic Cabling and Accessories.
   2. UTP Cabling and Accessories.
   3. Equipment Racks and Accessories.
   4. Ethernet switches.
   5. Industrial Media Converters.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
B. Section 26 05 33 – Raceways, Boxes, and Supports for Electrical Systems.
C. Section 26 05 43 – Underground Duct Banks and Manholes.
D. Section 26 05 53 – Identification for Electrical Systems.
E. Section 26 24 19 – Motor Control Centers.
F. Section 26 43 13 – Surge Protection Devices for Low-Voltage Electrical Power Equipment.
G. Section 40 62 00 – Computer System Hardware and Ancillaries.
H. Section 40 67 00 – Process Control Panels and Hardware.

1.04 REFERENCE STANDARDS:

A. Furnish equipment which conforms in all respects to applicable industry standards and sound engineer practice.
B. Furnish equipment which is FCC type accepted for the frequency band in which the equipment is to be applied.
C. Design, fabricate, assemble, and test equipment so as to conform with the latest revision of all applicable codes and standards including, but not necessarily limited to, the following.
D. Electronic Components Industry Association (ECIA):
   1. EIA/ECA-310-E – Cabinets, Racks, Panels, and Associated Equipment.
E. Insulated Cable Engineer's Association (ICEA).
   1. ICEA S-83-596 – Fiber Optic Premises Distribution Cable.
   2. ICEA S-104-696 – Indoor-Outdoor Optical Fiber Cable.
F. Institute of Electrical and Electronic Engineers (IEEE):
   1. IEEE 802.1 – Local and Metropolitan Area Networks.
   2. IEEE 802.3 – Ethernet.
   3. IEEE 802.11 – Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications.
   4. IEEE 1613 – Environmental and Testing Requirements for Communications Networking Devices in Electric Power Substations.
G. National Electrical Manufacturer's Association (NEMA):
   1. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum).
H. National Fire Protection Association (NFPA):
   1. NFPA 70 – National Electrical Code.

2. NFPA 262 – Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

I. Telecommunications Industry Association (TIA):
1. TIA-222-G – Structural Standards for Antenna Supporting Structures and Antennas.
2. TIA-232-F – Interface Between Data Terminal Equipment and Data Circuit – Terminating Equipment Employing Serial Binary Data Interchange.
3. TIA-329.1-D – Communications Antennas Base Station Antennas.
4. TIA-485-A – Electrical Characteristics of Generators and Receivers for Use in Balanced Digital Multipoint Systems.
5. TIA-455-21A – FOTP 21 Mating Durability of Fiber-Optic Interconnecting Devices.
6. TIA-492AAAA-B – 62.5-µm Core Diameter/125-µm Cladding Diameter Class Ia Graded-Index Multi-mode Optical Fibers.
7. TIA-492AAAB-A – 50-µm Core Diameter/125-µm Cladding Diameter Class Ia Graded-Index Multi-mode Optical Fibers.
8. TIA-492AAAC-B – 850-nm Laser- Optimized 50-µm Core Diameter/125-µm Cladding Diameter Class Ia Graded-Index Multi-mode Optical Fibers.
9. TIA-526-7 – Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant, Adoption of IEC 61280-4-2 Edition 2: Fibre-Optic Communications Subsystem Test Procedures – Part 4-2: Installed Cable Plant Single-Mode Attenuation and Optical Return Loss Measurement.
10. TIA-526-14-B – Optical Power Loss Measurements of Installed Multi-mode Fiber Cable Plant.
11. TIA-568.0-E – Generic Telecommunications Cabling for Customer Premises.
12. TIA-568.1-E – Commercial Building Telecommunications Infrastructure Standard.
13. TIA-568.2-D – Balanced Twisted Pair Cabling and Components Standard.
14. TIA-568.3-D – Optical Fiber Cabling Components Standard.
15. TIA-598-D – Optical Fiber Cable Color Coding.
16. TIA-607-D – Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises.

J. Telcordia Technologies Standards:
1. GR-20 – Generic Requirements for Optical Fiber and Optical Fiber Cable.
2. GR-409 – Generic Requirements for Indoor Fiber Optic Cable.

K. Underwriter's Laboratories, Inc. (UL):
1. UL 44 – Thermoset-Insulated Wires and Cables.
2. UL 50 – Electrical Cabinets and Boxes.
3. UL 444 – Communications Cables.
4. UL 467 – Grounding and Bonding Equipment.
5. UL 514C – Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers.
6. UL 969 – Marking and Labeling Systems.
7. UL 1581 – Electrical Wires, Cables, and Flexible Cords.
8. UL 1651 – Optical Fiber Cable.
9. UL 1666 – Flame Propagation Height of Electrical and Optical Fiber Cables Installed in Vertical Shafts.
10. UL 1685 – Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables.
11. UL 1863 – Communication Circuit Accessories.
12. UL 60950-1 – Information Technology Equipment - Safety - Part 1: General Requirements.

1.05 SUBMITTALS:

A. Submit as specified in Division 01.

B. Product Data: Submit for each type of product specified and included the following as minimum:
   1. Data sheets for each cable type and equipment type specified.
   2. Cable manufacturer's approval of pulling compounds.
   3. Cable manufacturer's installation requirements such as maximum pulling tensions, sidewall pressures, minimum bending radii, reel dimensions, etc.
   4. Other ancillary equipment and materials to be used.
   5. Description of cable identification tags and attachment methods which will be used.

C. Qualification Statements:
   1. Installer’s qualifications.
   2. Certifications:
      a. Submit certifications for personnel responsible for configuring and commissioning the managed network switches, servers, VLANs, VPNs, firewall appliances, routers, and other network security components.

D. Shop Drawings: Provide the following as minimum:
   1. Drawings indicating equipment rack layout and cable management plan.

E. Special Procedure Submittals:
   1. Test Plan:
      a. Provide a complete and detailed test plan for the fiber optic and UTP cabling system including a complete list of test equipment.
      b. Provide a complete and detailed test plan for the completed radio network including a complete list of test equipment.
      c. Include procedures for certification, validation, and testing.

F. Test and Evaluation Reports:
   1. Factory test reports.
   2. Field test reports.

G. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Preventive maintenance plan and schedule.
      b. Copies of all approved Shop Drawings.
      c. Copies of all approved Product Data.
      d. Copies of all approved Test Reports.
      e. Spare parts and supply list.
      f. Warranty Information.
      g. Contractor Information.

H. Maintenance Material Submittals:
   1. Spare Parts:
      a. Ethernet Switches: Provide one spare of each type of switch used.
      b. Fiber and UTP patch cables: Provide spares as specified herein.
      c. Fuses: Provide two of each type used.
   2. Software:
      a. If software is not embedded, compile original software on flash media or SSD associated with the supplied network hardware and submit.

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer’s latest standard design that

has been in satisfactory use for at least 1 year prior to Bid opening. Each major component of the equipment shall have the manufacturer's name and type identified on the equipment. All products supplied shall be specifically designed and manufactured for use with plant communications systems. All items of the same class of equipment shall be the products of a single manufacturer unless indicated otherwise.

B. Factory Tests:
   1. Quality Control Test Protocol: The manufacturer shall conduct tests according to industry standard requirements. These tests shall be performed routinely on sample sizes sufficient to verify quality and continuity or as specified.
   2. The end-to-end attenuation of each reel of fiber optic cable supplied shall be tested. All of the fibers per reel shall be tested. The results shall be recorded and provided with the cable when shipped. A copy of these test reports shall be submitted to Engineer.

C. Fiber Optic Cable Site Tests:
   1. Upon delivery of the fiber optic cable to the specified location, the Contractor shall perform acceptance testing.
   2. Perform optical fiber end to end attenuation tests using an optical light meter and manufacturer's recommended test procedures.
   3. Perform tests in accordance with TIA-526-14-B, Method B for horizontal, multi-mode optical fiber.
   4. Perform tests in accordance with ANSI/TIA-526-7 OFSTP-7 for single-mode optical fiber.
   5. Copies of the tests showing the attenuation results for each fiber shall be submitted to the Owner and Engineer no later than 5 days after acceptance of the cable.
   6. Any visible damage to the cable construction should be brought to the Engineer's attention immediately.
   7. Refer to PART 3 – EXECUTION for additional site testing requirements.

D. Installer Qualifications:
   1. Cabling:
      a. Prior to installation, submit data of installer's experience and qualifications.
      b. Installers shall be a Building Industry Consulting Service International (BICSI) Registered Cabling Installation Technician or have experience which shall include projects of similar complexity. Include names and locations of projects successfully completed using optical fiber and copper communications cabling systems.
      c. Include written certification from users that systems have performed satisfactorily for not less than 18 months.
      d. Include specific experience in installing and testing structured communications distribution systems using managed Ethernet switches, optical fiber, and Category 6 cabling systems.
   2. Industrial Control System (ICS) Security Professional Certifications:
      a. The installer responsible for configuration and commissioning of network switches, firewalls, servers, VLANs, wireless access points, and other network communication devices shall hold a current Cisco Certified Network Professional (CCNP) Enterprise certification or hold other approved networking certifications.
      b. To be considered equivalent, the certification must cover topics including, but not limited to, routing & switching, WAN solutions, wireless networks, remote access, and network security. The certificate of the qualified technician shall be submitted as required this Section.

c. Configuration of the network indicated for this Contract shall comply with the specifications herein and industry best practices for ICS network security and reliability.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Network hardware and associated equipment shall be packaged and shipped to the project site to avoid damage.

B. All network appliances shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install the network equipment specified herein until designated installation spaces are enclosed, weather tight, and free of contaminants.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to installation and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. Ethernet switches, routers, and other similar network appliances shall be provided with a minimum 5-year manufacturer's warranty.

B. All other equipment shall be provided with a minimum one-year warranty period.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Fiber-Optic Cables:
1. AFL.
2. Avaya Inc.
3. Belden Inc.
4. Berk-Tek, Nexans.
5. Draka Cableteq USA Corporation, Prysmian Group.
6. Corning Optical Communications.
7. CommScope Inc.
8. General Cable Technologies Corporation.
9. Mohawk, Belden Inc.
10. Optical Cable Corporation.
11. Superior Essex Inc.

B. Fiber-Optic Cable Connectors, Duplex Jumpers, Patch Panels and Accessories:
1. AFL.
2. Avaya Inc.
3. Corning Optical Communications.
4. DINSpace.
5. Hirshmann, Belden Inc.
6. Ortronics, Legrand.
7. Panduit.

C. UTP Cables, Patch Panels, Connectors and Accessories:
1. Belden.
2. Berk-Tek, Nexans.
3. Leviton.

4. Mohawk, Belden.
5. Ortronics, Legrand.
6. Panduit.
7. Siemon.

D. Equipment Racks:
1. Black Box Corporation.
2. B-Line, Eaton.
3. Hoffman, nVent.
4. Lowell Manufacturing Company.
5. Middle Atlantic Products, Legrand.
6. Panduit.
7. Rittal, Inc.
8. Engineer-approved equal.

E. Ethernet Switches:
1. Allen-Bradley, Rockwell Automation.

F. Industrial Media Converters:
1. Advantech Co., Ltd.
2. Black Box Corporation.
3. Hirschmann, Belden Inc.
4. Moxa Inc.
5. GarrettCom, Inc.
6. N-Tron Series, Red Lion Controls, Inc.

G. Cable Accessories:
1. Tape:
a. Minnesota Mining and Manufacturing (3M).
2. Cable Ties:
a. AMP, TE Connectivity Ltd.
b. IDEAL Industries, Inc.
c. Minnesota Mining and Manufacturing (3M).
d. Panduit.
e. Thomas and Betts Corporation, ABB Group.
3. Cable Supports:
a. O-Z Gedney, Emerson Electric Co.

2.02 FIBER-OPTIC CABLE:

A. General:
1. Surface printing on cable shall show manufacturer's name, jacket types, number of conductors, numbered footage markers, and words "Fiber-Optic Cable" or "Optic Cable". The markings shall be in contrasting color to cable jacket.
2. Cable operating temperature range (long term and storage) shall be from -40°C to +70°C (-40°F to +158°F).
3. Standard factory tests shall be performed on all cable.
4. Cable shall meet the following requirements:
a. Shall contain multi-mode fibers in numbers indicated.
b. Shall consist of 900 µm tight buffered optical fibers, stranded together with aramid yarn strength members and contained in a PVC outer jacket.
c. All cable elements shall be stranded together to maintain flexibility. Stiff central elements such as wire or dielectrics epoxy glass rods shall not be permitted.

Aramid yarn strength member elements shall be precision tensioned and uniformly distributed around the fibers.

d. Jacket shall be PVC and rated for indoor and outdoor installation. Jacket shall be fungus-resistant, UV inhibited, flame retardant, and contain a rip cord for easy removal. Tape separators are not allowed.

5. Cable shall meet the flame test requirements of UL 1666 and UL 1651.
   a. Indoor cable shall be certified to be in conformance with all applicable requirements of UL OFNR riser rated cable.
6. Cable shall meet the applicable requirements of ICEA S-83-596, ICEA S-104-696, TIA-492AAAA (OM1), TIA-492AAAB (OM2), TIA-492AAAC (OM3).

B. Optical Fiber Cabling: Multi-mode (FIB1):
1. Each fiber shall have a tight buffer 900 µm, color coded, mechanically strippable, acrylate protective coating.
2. The entire fiber length per reel shall be unspliced and subjected to a tensile proof stress test equivalent to 100 kpsi for 1.0 second dwell time.
3. Optical Fiber Parameters: The following specifications represent minimum values.
   a. Shall be multi-mode graded index with 50/125/900 µm fiber/cladding/buffer diameters. Must be OM3 quality or better.
4. Fiber attenuation and bandwidth:

Optical Wavelength (nm):	850	1300
Maximum Attenuation (dB/km):	3.5	1.0
50/125 µm – OM3 Minimum Bandwidth (MHz-km):	1500	500

C. Optical Fiber Cabling: Single-mode (FIB2):
1. Fiber cable shall be loose tube, gel free water-blocking design for outdoor underground duct installation. Cable shall have an overall polyethylene strippable jacket with individually color-coded fibers.
2. The entire fiber length per reel shall be unspliced.
3. Optical Fiber Parameters: The following specifications represent minimum values.
   a. Shall be single-mode graded index with 9/125/900µm fiber/cladding/buffer diameters. Cable shall be rated to OS2 standards.
4. Fiber attenuation and bandwidth:

Optical Wavelength (nm):	1310	1550
Outside Plant Maximum Attenuation (dB/km):	0.5	0.5

5. Cable shall be water-blocked per water penetration requirements of GR-20-CORE or equivalent. Water-blocking of pathway alone will not be considered sufficient for adequate protection against water-ingress in the fiber optic cable.
6. Cable shall meet the applicable requirements of ICEA S-87-640, ICEA S-104-696 and TIA-492CAAC (OS2).

2.03 FIBER-OPTIC DUPLEX JUMPER/PATCH CORD:

A. Two-fiber cable with zipcord cable design, riser - rated (UL listed type OFNR).
B. Fiber shall be 50/125 µm, multi-mode, graded index, OM3 quality or 9/125 µm, single mode, graded index, OS2 as applicable.
C. Factory installed LC type connectors on each end of each fiber for patch through cables and connection to panel mounted Ethernet switches as required.
D. Factory installed LC type connectors on one end and SC type connectors on other end when required for changing connector types.

E. Minimum length of 3 feet. Provide longer jumpers as required.
F. Provide patch cords as indicated plus 20% spare of each type.

2.04 FIBER-OPTIC PATCH PANELS:

A. Shall be a complete system of components by a single manufacturer, and shall provide termination, splice storage, routing, radius limiting, cable fastening, storage, and cross connection.
B. Shall be capable of terminating number of fibers indicated plus 25% spare capacity.
C. Shall be equipped with strain-relief and routing guides for incoming cables to ensure minimum bend radius is not exceeded.
D. Patch panels shall be provided with adapter plates loaded with LC connectors that utilize zirconia ceramic alignment sleeves. Connectors shall be provided with dust covers.
E. Epoxyless crimp style LC connectors compatible with 50/125 multi-mode or 9/125 single-mode fiber as applicable and shall have maximum attenuation of .3 dB at 1300 nm with less than a 0.2 dB change after 500 mating cycles.
    1. Patch panels for the 9/125 single-mode fiber may alternately utilize cassette style patch modules/panels with LC adapter plate and factory terminated and tested 1-meter pigtails and duplex LC connectors suitable for fusion splicing. AFL Poli-MOD or equal.
    2. Pigtails shall be provided with 250 µm jacket and heat shrink splice protector.
F. Shall be provided with labeling space, panel directory and warning labels.
G. Panel Mounted:
    1. Single compartment enclosure or modular design with fiber optic adaptors mounted in the side or face of unit.
    2. Shall be DIN or back-panel mounted in enclosures or control panels as indicated.
    3. Coordinate size of patch panel with control panel manufacturer.
H. Rack Mounted:
    1. Designed for installation within a 19-inch equipment rack.
    2. Slide out tray to provide front access to fiber optic cables.
    3. Cable management rings to provide bending radius control for patch cords.

2.05 UNSHIELDED TWISTED PAIR (UTP) CABLE:

A. Provide four each individually twisted pair, 23-24 AWG conductors, 100 ohm, NFPA 70 CMP rated with PVC jacket for indoor applications and NFPA 70 CMR/CMX rated for outdoor applications.
B. Individual pairs shall be constructed to contain a minimum of two twists per foot per each pair.
C. Overall diameter of four pair cable shall not exceed 0.25 inches.
D. Ultimate breaking strength shall be minimum 90 pounds.
E. Shall withstand a bend radius of one inch minimum at a temperature of -20°C or lower without jacket or insulation cracking.
F. Shielded Cable (CAT6-S)
    1. Provide overall shielded category 6 cable for outdoor application and where indicated.
    2. Cable shall include an aluminum foil shield with tinned copper drain wire.
    3. Shall meet all other specifications and requirements for UTP cable as specified herein.
G. Conductors shall be color coded and polarized in accordance with TIA-568-C.2.
    1. Category 6 UTP shall meet or exceed the standards set forth in TIA-568-C.2.
        a. Insertion Loss (IL) / Attenuation (Maximum): 32.8 dB/100 m @ 250 MHz.
        b. NEXT (Minimum): 38.3 dB/100 m @ 250 MHz.
        c. PSNEXT (Minimum): 36.3 dB/100 m @ 250 MHz.
        d. ELFEXT (Minimum): 19.8 dB/100 m @ 250 MHz.

e. PSELFEXT (Minimum): 16.8 dB/100 m @ 250 MHz.
f. Propagation Delay (Maximum): 536 ns/100 m @ 250 MHz.
g. Velocity of Propagation (Minimum): 62.1% @ 250 MHz.
h. Propagation Delay Skew (Maximum): 45 ns/100 m @ 250 MHz.
i. Return Loss (Minimum): 17.3 dB/100 m @ 250 MHz.

H. Cable shall meet the applicable testing requirements of UL 444, UL 1581, UL 1666, UL 1685, and NFPA 262.
I. Cable jackets shall be color coded according to the following standard:
1. Plant Control System Network – Orange.
2. Business/Enterprise Network – Blue.
3. Access Control (All types) – White.
4. Security Audio/Visual Applications – Yellow.

2.06 UTP JUMPER/PATCH CORD:

A. Patch cords shall consist of factory assembled, 4 pair, 100 ohm UTP, Category 6 cables and equivalent eight-position, RJ-45 wiring connectors at each end.
B. Cables shall be wired with straight through pinning and shall be label verified.
C. Cable jacket shall be factory marked indicating organization and performance level.
D. Cable assemblies shall be designed with strain relief at each connector.
E. Cables shall be terminated according to type T568B configuration as defined by TIA-568-C.1.
F. Minimum length of 2 feet. Provide longer jumpers as required.
G. Provide patch cords as indicated plus 25% spare.
H. Cable shall comply with the applicable requirements of UL 444, UL 1685, UL 1863, and ANSI/TIA-568-C.2.
I. Cable jackets shall be color coded according to the following standard:
1. Plant Control System Network – Orange.
2. Business/Enterprise Network – Blue.
3. Access Control (All types) – White.
4. Audio/Visual Applications – Yellow.

2.07 COMMUNICATIONS JACK/CONNECTOR ASSEMBLIES:

A. Copper jack/connectors shall comply with FCC Part 68.5, and TIA-568-C.2.
B. Shall be UL 1863 and UL 44 listed, non-keyed, 4 pair, constructed of high impact rated thermoplastic housing and shall be third party verified and shall comply with TIA-568-C.2 Category 6 requirements.
C. Shall meet or exceed Category 6 requirements.
D. Shall be terminated using a 110 style PC board connector, color coded for both T568A and T568B wiring.
E. Shall be wired T568B.
F. Shall comply with TIA-455-21A for 500 mating cycles.
G. Cover plates shall comply with UL 514C, and TIA-568-C.2; flush design constructed of 302 stainless steel material.
H. Stenciled lettering for voice and data circuits shall be provided using thermal ink transfer process.
I. Cover plates shall accept 4 Category 6 data jacks, or 4 RJ-45 telephone jacks, or a combination thereof.
J. Provide blank filler plates as required.

2.08 UTP PATCH PANELS:

A. Shall be a complete system of components by a single manufacturer, and shall provide termination, cable fastening, storage, and cross connection.
B. Utilize 110-style punch-down terminations on back of panel with individual retention caps. RJ-45 ports on front of unit.
C. Rear of panel shall have incoming cable strain relief and routing guides.
D. Shall meet or exceed TIA-568-C.2-1 Category 6 requirements. Each port shall be factory tested.
E. Wired to T568B configuration.
F. Shall be capable of terminating number of cables as indicated plus 25% spare capacity.
G. Shall be provided with labeling space, panel directory and warning labels.
H. Designed for installation within a 19-inch equipment rack.

2.09 EQUIPMENT RACKS:

A. Floor Mounted:
   1. Provide floor mounted enclosed style equipment racks unless indicated otherwise. 19-inch (483 mm) standard designed complying with EIA/ECA-310-E.
   2. Shall be a minimum of 42U of mounting units and shall be a minimum of 29-inches wide by 36-inches deep.
   3. Load rated for a minimum of 1500 pounds.
   4. Lockable perforated front door with reversible hinges.
   5. Lockable, perforated, split rear door.
   6. Removable solid side panels.
   7. Louvered top panel with ventilation fans. Fans shall be provided with cord and plug and provide a minimum of 500 cfm of air flow. Provide plug and cord type thermostat controls with integral receptacle for fan plug connections.
   8. Leveling feet.
   9. Square hole mounting angles. Provide the required cage nuts and bolts with a minimum of 25% spare.
   10. Black powder coat finish.
   11. Provide a vertical plug strip with NEMA 5-20R receptacles, 12-inches (300 mm) o.c. for the full height of the rack for each supplying circuit. Provide additional strips if required to accommodate all installed equipment plus 20% spare.
   12. Provide a grounding kit for each rack.
   13. Provide horizontal cable managers below each patch panel and Ethernet switch.
   14. Provide vertical D-rings or vertical cable troughs along each side for management of vertical routed cables.
   15. Provide sliding shelves for monitors, keyboards, and other non-rack mountable equipment.
   16. Provide all shelves, drawers, and accessories required for mounting and supporting equipment within the rack.
B. Wall Mounted:
   1. Wall mounted pivot style equipment rack only where indicated. 19-inch standard designed complying with EIA/ECA-310-E.
   2. Shall be a minimum of 18U of mounting units and shall be a minimum of 26-inches wide by 26-inches deep. Coordinate final depth requirements to coordinate with equipment supplied.
   3. Load rated for a minimum of 200 pounds.
   4. Swing open center section for front and rear access.

5. Lockable front door and center section with reversible hinges for right or left-hand swing.
6. Passive thermal management with mounting options for optional fan kit.
7. Adjustable wide-face rackrail with minimum 4" setback to accommodate cable managers. Provide required cage nuts and bolts with a minimum of 25% spare.
8. Rack shall include conduit knockouts on the top and bottom of the back pan with 12" x 12" (minimum) opening on backpan for cable entry.
9. Black powder coat finish.
10. Provide a vertical plug strip with NEMA 5-20R receptacles, 12-inches (300 mm) o.c. for the full height of the rack for each supplying circuit. Provide additional strips if required to accommodate all installed equipment plus 20% spare.
11. Provide a grounding kit for each rack.
12. Provide horizontal cable managers below each patch panel and Ethernet switch.
13. Provide vertical D-rings or vertical cable troughs along each side for management of vertical routed cables.
14. Provide sliding shelves for non-rack mountable equipment.
15. Provide all accessories required for mounting and supporting equipment within the rack.

2.10 RACK MOUNTED MANAGED ETHERNET SWITCHES:

A. Rack mounted managed (Layer 3) Ethernet switches shall be a modular multi-gigabit design supporting the specified and indicated configurations.
B. Rackmount chassis for installation in a 19-inch equipment rack.
C. Operating temperature 0°C to 60°C minimum.
D. Ethernet switch shall accept Small form-factor pluggable (SFP) media modules.
   1. Provide with uplink ports for connection to the fiber backbone with additional fiber ports as indicated. Uplink ports shall be available in 10-gigabit or 1-gigabit modules.
      a. 10-gigabit SFPs shall be provided.
   2. Provide with single-mode SFPs with LC type connectors.
E. Provide with the required quantity of 10/100/1000 Base-T RJ-45 ports.
F. Provide IEEE 802.3af/at Power-over-Ethernet (PoE+) ports for network switches when indicated to support IP cameras and any other PoE powered devices indicated. Final quantity and loading of the PoE switches determined by supplying subcontractor based on the equipment supplied. Switches shall include a minimum of 4 PoE+ ports.
G. Shall provide half and full duplex operation.
H. Provide with redundant 120Vac, 60-hertz power supplies and cord and plug connection.
I. Provide with redundant fan module for switch chassis if required to meet industrial environment ratings.
J. LED indicators for system status, each power supply status, fault.
K. LED indicators for each port indicating link, activity, full/half duplex mode and speed.
L. Provide with a basic set of I/O parameters available via the EtherNet/IP protocol for device management and remote monitoring.
   1. When EtherNet/IP protocols are not available from specific manufacturer's, SNMP protocols shall be used in conjunction with an SNMP OPC server to collect the required I/O points for the plant control system.
M. Comply with IEEE 802.1Q, 802.1D, 802.1X, 802.3, 802.3U, 802.3X, 802.3Z, 802.3ab, 802.3ae.
N. Capable of operating in a mesh network with rapid spanning tree protocol and manufacturer's proprietary equivalent.
O. Shall support the following protocols or functions as minimum: SNMPv3, IGMP, DHCP, RMON, RSTP, HTTP, HTTPS, Telnet, QoS, and VLAN.

P. Shall be UL listed and FCC approved. Unit shall be rated for continuous operation under the environmental temperature, humidity, and vibrating conditions encountered at the installed location.
Q. Provide all required management and monitoring software.
R. Provide Allen-Bradley Stratix 5800 series industrial switch or Engineer-approved equal.

2.11 PANEL MOUNT MANAGED ETHERNET SWITCHES:

A. Panel mounted managed (Layer 2 minimum) Ethernet switches shall be 10/100/1000 Mbps autosensing and operate using the Store and Forward Method.
B. Compact Industrial DIN rail mounted design.
C. Convection cooled with no fans and designed for an industrial environment.
D. Operating temperature 0°C to 60°C minimum.
E. Ethernet switch shall be modular in design and accept Small form-factor pluggable (SFP) media modules.
F. Provide with a minimum of two SFP or integral gigabit LX ports for connection to the fiber backbone when indicated. Provide with single-mode LC type connectors.
G. Provide with the indicated number of 10/100/1000 Base-T RJ-45 ports.
    1. Port count shall include 20% spare with a minimum of two.
H. Provide with IEEE 802.3af/at Power-over-Ethernet (PoE+) ports when required for the application.
I. Shall provide half and full duplex operation.
J. Input power 24Vdc with terminal blocks for connection.
K. LED indicators for system status, each power supply status, fault.
L. LED indicators for each port indicating link, activity, full/half duplex mode and speed.
M. Provide with a basic set of I/O parameters available via the EtherNet/IP protocol for device management and remote monitoring.
    1. When EtherNet/IP protocols are not available from specific manufacturer's, SNMP protocols shall be used in conjunction with an SNMP OPC server to collect the required I/O points for the plant control system.
N. Comply with IEEE 802.1Q, 802.1D, 802.3, 802.3U, 802.3X, 802.3Z, and 802.3ab.
O. Capable of operating in a mesh network with rapid spanning tree protocol.
P. Shall support the following protocols or functions as minimum: SNMPv3, IGMP, DHCP, RMON, RSTP, HTTP, HTTPS, Telnet, and VLAN.
Q. Shall be UL listed and FCC approved. Unit shall be rated for continuous operation under the environmental temperature, humidity, and vibrating conditions encountered at the installed location.
R. Provide all required management and monitoring software.
S. Provide Allen-Bradley 5200 series industrial switch or Engineer-approved equal.

2.12 INDUSTRIAL MEDIA CONVERTER:

A. Provide only when indicated for media conversion of copper to direct fiber connections for specific use case.
B. DIN rail mounted 10/100Base-TX to 100Base-FX media converter.
C. Shall be autosensing.
D. Support full and half duplex operation and operate using the Store and Forward Method.
E. Equipped with one RJ-45 10/100Base-TX port and dual LC or SC-type 100Base-FX ports.
    1. Provide LC to SC fiber jumpers when required to mat with alternate form factors.
F. LED indicators for power, link status and activity.
G. Shall comply with IEEE 802.3 and 802.3U.

H. Environmental Specifications:
   1. Operating Temperature: -20° to 60°C.
   2. Ambient Relative Humidity: 5%-95% (non-condensing)

I. Powered from 120Vac or 24Vdc power supply. Provide DIN rail mounted power supply sized for the unit if required.

2.13 ACCESSORIES:

A. Cable Supports:
   1. Cable supports for cables in vertical conduit risers or vertical tray, with considerable weight of cables shall be O. Z. Gedney Type "R" wedging plug type or approved equal.

B. Cable Ties:
   1. Shall be hook-and-loop (Velcro type) to meet EIA/TIA standards.

C. Cable Identification Tags:
   1. Designed to provide a permanent wire and cable identification system.
   2. Show complete cable number including colors.
   3. Cable numbers shall be machine printed, legible, and permanent.
   4. Character size for cable numbers shall be a minimum of 1/8 inch.
   5. Material shall be nonmetallic and impervious to moisture.
   6. Be securely attached to cables and accessible for inspection.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment. The area for network equipment installation shall be fully enclosed, weather tight, and free of contaminants.

B. Final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to installation and shall be maintained for the remainder of the construction period.

C. Verify that all labels and nameplates meet UL 969 standards.

D. Any applicable equipment shall meet UL 60950-1.

3.02 INSTALLATION:

A. General:
   1. Cabling, connector assemblies, and associated hardware shall be installed in accordance with TIA 568 C.1, TIA 568 C.2, TIA-568-C.3, TIA 569 C, NFPA 70, and UL standards as applicable.
   2. Equipment Asset Tags:
      a. Provide and affix asset tags for all supplied network hardware. Asset tag shall be as specified or indicated.

B. Cable:
   1. General Requirements:
      a. Metal raceway bases, covers, and dividers shall be bonded and grounded in accordance with TIA-607-B and UL 467.
      b. Install cable in raceway as indicated.
      c. Do not subject cable to pulling tensions or sidewall pressures in excess of manufacturer's recommendations.
      d. Contractor shall use a load rated swivel, rated to assure compliance with cable pulling tension as published by the cable manufacturer.

e. Attach pulling grips around the cable diameter. Sufficient slack should be provided to cut off several meters of cable after it is in place.
f. Do not subject cable to bending radius less than those recommended by the cable manufacturer.
g. Support cables at connections or termination points such that any strain on cable will not be transmitted to the connection or termination.
h. Install cable supports in vertical runs of conduit, at boxes and at terminations in equipment, and as required to meet intermediate support requirements of National Electrical Code (NEC).
i. All pulling compounds shall be approved by cable manufacturer as being compatible with cable materials.
j. Follow the cable numbering scheme indicated and attach a cable identification tag to each cable at all termination or end points.

2. Fiber Optic Cable:
   a. Contractor shall exercise due caution during installation of the fiber-optic cable to prevent damage to glass fibers. Follow manufacturer's recommendations for maximum cable lengths.
   b. Fiber optic cable shall not be spliced.
   c. Install cables in conduit and underground duct bank as indicated and specified.
   d. Install pull boxes as required.
   e. All pull boxes and termination cabinets shall be clearly identified as containing fiber-optic cable.
   f. Coil a minimum of 20 feet of excess fiber optic cable at each pull box or handhole.
   g. There shall be a minimum of 10 feet of excess fiber-optic cable remaining at all terminations for the purpose of making connections, splices or tests.
   h. Cable Bends:
      (1) Make gradual bends of cable, where necessary.
      (2) Do not allow cable to be sharply bent or kinked at any time.
      (3) Maximum bending radius of 20x the cable diameter.
   i. Cable Pulling:
      (1) Do not exceed manufacturer's recommended pulling tension.
      (2) Tension shall be monitored at all times with a dynamometer or with a pulling wheel.
   j. Cable identification tags shall be installed at each pull box.
   k. Label cable at each termination points with unique number for each cable segment.
   l. Cable Ties: Dress cables neatly with cable ties using low to moderate pressure.
   m. Testing Cables: Testing shall be performed in accordance with TIA-568-C.0.
      (1) Clean all connections and adapters at each optical test point prior to taking measurements, as per TIA-526-7-A (single-mode) or TIA-526-14-B (multi-mode).
      (2) The recommended test method for multi-mode shall be TIA-526-14-B single-jumper method (Method B.)
      (3) The recommended test method for single-mode shall be TIA-526-7-A, single-jumper method (Method A.1)
   n. Cable Slack:
      (1) Leave extra slack on cables, neatly coiled-up in patch panel box.
      (2) Leave a minimum of 10 feet of cable slack at each fiber patch panel.
   o. Do not install cables taut.

3. UTP Cable:
    a. Communications cabling and pathways with copper media shall be installed in accordance with the following criteria to avoid potential electromagnetic interference between power and communications equipment.
        (1) The interference ceiling shall not exceed 3.0 volts per meter measured over the usable bandwidth of the communications cabling.
        (2) Pathways shall be installed in accordance with the following minimum clearance distances of 4 feet from motors, generators, frequency converters, transformers, or uninterruptible power system, 12 inches from power conduits and cable systems, 5 inches from fluorescent or high frequency lighting system fixtures.
    b. Screw terminals shall not be used.
    c. Use an approved insulation displacement connection (IDC) tool kit for copper cable terminations.
    d. Do not untwist Category 6 UTP cables more than 1/2 inch from the point of termination to maintain cable geometry.
    e. Provide service loop on each end of the cable, 10 feet at the equipment rack and 12 inches at the jack.
    f. Do not exceed 25 pounds pull tension for four pair copper cables.
    g. Do not chafe or damage outer jacket materials.
    h. Do not over cinch cables, or crush cables with staples.
    i. UTP cable bend radii shall not be less than four times the cable diameter.
4. Cable Connections and Terminations:
    a. Contractor shall provide a qualified technician to make all connections and terminations cable as specified.
    b. All cable connections and terminations shall be made according to manufacturer's instructions.
    c. Make only in terminal boxes, equipment or other accepted enclosures and not in conduit or cable tray.
    d. Install all connectors with manufacturer's approved tooling.
    e. Cable identification markers shall be installed at each connection.

C. Equipment Racks:
1. Equipment racks shall be installed at location indicated. Verify proper clearances and adequate access prior to installation.
2. Install grounding kit and bond to building ground system.
3. Install cable management accessories and supports as specified.
4. Securely install equipment in racks as indicated. When required monitor and keyboard shelves shall be mounted at a convenient operating height.
5. Utilize manufacturer’s recommended fasteners for all connections.

D. Fiber Optic Patch Panels:
1. Install rack mounted patch panels in equipment racks.
2. Install panel mounted enclosures in NEMA rated enclosure or control panels as specified and indicated. For panels installed in equipment manufacturer’s control panels coordinate with supplier for required panel space and location.
3. Arrange with proper clearances from other equipment and material to obtain accessibility for operation and maintenance.
4. Install adaptor plates and connectors in accordance with manufacturer’s recommendations.
5. Utilize panel spools for slack management of individual fibers.

6. Mount plumb and level.
7. Complete panel directory and labeling.

E. UTP Patch Panels:
1. Install in equipment racks.
2. Punch down cables as specified.
3. Install cable strain relief and routing guides.
4. Wire to T568B configuration.
5. Complete port labeling.

F. Ethernet Switches:
1. Install Ethernet switches in equipment rack or control panels and make connections as indicated.
2. Arrange with proper clearances from other equipment and material to obtain accessibility for operation and maintenance.
3. Program managed switches for proper operations.
   a. Rapid spanning tree, or network switch manufacturer equivalent protocol, shall be implemented for redundancy in a loop connected system.
   b. Program switch fault contacts to alert operators of switch problems or errors.
4. Where management software is not embedded, install on the server or designated laptop to allow the Owner to monitor and configure the Ethernet switches.

G. Industrial Media Converters:
1. Mount the industrial media converters where indicated.
2. Configure media converters per manufacturer instructions.

3.03 FIELD QUALITY CONTROL:

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

C. System Tests:
1. Perform communications cabling inspection, verification, and performance tests in accordance with TIA-568-C.0, TIA-568-C.1, TIA-568-B.2 and TIA-568-C.3.
2. Inspect all cabling terminations to confirm color code for tip and ring pin assignments and inspect cabling connections to confirm compliance with TIA-568-C.2.
3. Perform optical fiber end to end attenuation tests using an optical light meter and manufacturer's recommended test procedures.
   a. Perform tests in accordance with TIA-526-7-A Method A.1 for single-mode optical fiber and TIA-526-14-B, Method B for horizontal, multi-mode optical fiber.
   b. Perform verification acceptance test on each fiber after installation of the cable.
   c. Any excessive losses due to installation, connectors, etc., shall be identified and corrected by the Contractor and tested with no additional charge.
4. Category 6 Links: Perform UTP link tests in accordance with TIA-568-C.2.
   a. Tests shall include wire map, length, attenuation, NEXT, and propagation delay.
5. After acceptance of communication cable system, all additional components (including Ethernet switches and jumpers) shall be installed and operation of the complete system tested.
6. Copies of the test shall be submitted to the Engineer for acceptance of the communication system.

3.04 ADJUSTING AND CLEANING:

A. All network cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.

B. Prior to final acceptance all network equipment shall be wiped clean and free from dust.

3.05 TRAINING:

A. Provide a minimum of 4 hours of training at the customer's facility for operations, maintenance, and service personnel of the installed network and system equipment.
   1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
   2. Topics covered shall include hardware layout and functions, programming and configuration, diagnostic indicators, faults, diagnostic tools, troubleshooting, and preventive maintenance.
   3. Hands-on training shall be provided on equipment.
   4. Documentation shall be provided which shall include actual hard copies of manuals for the equipment supplied for this project.

B. Contractor shall record the training sessions and provide a final edited version to the Owner in electronic video file format.

C. Training shall conform to the requirements of Section 01664 – Training.

END OF SECTION 40 66 00

SECTION 40 67 00 – PROCESS CONTROL PANELS AND HARDWARE

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes requirements for control panels including, but not limited to, the following:
   1. Equipment manufacturer supplied control panels.
   2. PLC Cabinets.
   3. HVAC equipment control panels.
   4. Network and Security Enclosures.

1.03 RELATED REQUIREMENTS:

A. Section 26 33 53 – Static Uninterruptible Power Supply.
B. Section 40 60 00 – Process Control and Instrumentation - General Requirements.
C. Section 40 61 96 – Process Control System Programming and Reports.
D. Section 40 66 00 – Network and Communications Equipment.
E. Section 40 68 00 – Process Control Software.
F. Section 40 70 00 – Instrumentation for Process Systems.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
B. Institute of Electrical and Electronic Engineers (IEEE):
   1. IEEE C37.90.1 – Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus.
   2. IEEE C62.11 – Metal Oxide Surge Arresters for AC Power Circuits.
   3. IEEE C62.33 – Test Specifications for Varistor Surge-Protective Devices.
   4. IEEE C62.36 – Surge Protectors Used in Low-Voltage Data, Communications, and Signaling Circuits
   5. IEEE C62.41.1 – Surge Environment in Low-Voltage (1000 Volts and less) AC Power Circuits.
   6. IEEE C62.41.2 – Characterization of Surges in Low-Voltage (1000 Volts and less) AC Power Circuits.
   7. IEEE C62.45 – Surge Testing on Equipment Connected to Low Voltage (1000 Volts and less) AC Power Circuits.
   8. IEEE C62.62 – Test Specification for Surge Protective Devices (SPDs) for Use on the Load Side of the Service Equipment in Low Voltage (1000 Volts and less) AC Power Circuits.
   9. IEEE 802.1 – Local and Metropolitan Area Networks.
   10. IEEE 802.3 – Ethernet.
C. National Fire Protection Association (NFPA):
   1. NFPA 70 – National Electrical Code (NEC).
   2. NFPA 79 – Electrical Standard for Industrial Machinery.
D. National Electrical Manufacturers Association (NEMA):
   1. NEMA 250 – Enclosures for Electrical Equipment (1,000V maximum).
   2. NEMA ICS 1 – Industrial Control and Systems - General Requirements.

3. NEMA ICS 2 – Industrial Control and Systems - Controllers, Contactors, and Overload Relays Rated 600 Volts.
4. NEMA ICS 4 – Application Guideline for Terminal Blocks.
5. NEMA ICS 5 – Industrial Control and Systems - Control Circuit and Pilot Devices.
6. NEMA ICS 6 – Industrial Control and Systems - Enclosures.
7. NEMA ICS 7 – Adjustable Speed Drives.

E. Underwriters Laboratories (UL):
1. UL 50 – Enclosures for Electrical Equipment.
2. UL 489 – Molded-Case Circuit Breakers, Molded-Case Switches and Circuit Breaker Enclosures.
3. UL 508 – Industrial Control Equipment.
4. UL 508A – Industrial Control Panels.
5. UL 698A – Industrial Control Panels Relating to Hazardous (Classified) Locations.
6. UL 869A – Service Equipment.
7. UL 1077 - Supplementary Protectors for Use in Electrical Equipment
8. UL 1449 – Surge Protective Devices.

1.05 SUBMITTALS:

A. Submit as specified in Division 1.
B. Manufacturer with prime responsibility shall assume responsibility for all Compliance Submittals.
C. Product Data: Submit the following for each type of product specified and included as minimum:
1. Data sheets for all control panel components furnished.
D. Qualification Statements:
1. Fabricator's qualifications.
E. Shop Drawings: Provide the following as minimum:
1. Fabrication drawings, front elevation, wiring diagrams, and bills of material for control panels.
2. Electrical connection diagrams showing termination locations for all field wiring. External connection diagrams shall indicate cable number and wire color for field cables terminated at the panel.
3. Engraving schedule and physical dimensions for nameplates.
4. Provide heat dissipation calculations for all panels containing programmable logic controllers. Include calculation for ventilation fans if required.
F. Special Procedure Submittals:
1. Test Plan:
a. Provide a complete and detailed test plan for the supplied control panels.
b. Include procedures for certification, validation, and testing.
2. Syllabus for Owner training.
G. Test and Evaluation Reports:
1. Factory test reports.
2. Field test reports.
H. Closeout Submittals: Final documentation shall include the following as minimum:
1. Operation and Maintenance Manuals including the following:
a. Operation and maintenance manuals for all components furnished.
b. Certified "As-Built"/"As-Installed" drawings.
c. Copies of all approved Product Data.
d. Copies of all approved Test Reports.

e. Spare parts and supply list.
f. Warranty Information.
g. Contractor Information.
h. Training Materials. Includes final edited training videos.

I. Maintenance Material Submittals:
1. Spare Parts:
a. Two spare LED indicating lamps for each type and color used.
b. Two spare indicating light assemblies.
c. Ten spare control fuses of each voltage and current rating used.
d. One aerosol cans of manufacturer's touch-up paint for each color used. Color shall match the original factory applied color.
e. PLC spare parts listed below are for plant control system PLC Cabinets only. Vendor supplied PLC spare parts shall be as specified in the associated equipment Section.
(1) Provide at least one spare for each piece of PLC Equipment provided, including but not limited to:
(a) Processor.
(b) PLC chassis.
(c) Power supply.
(d) Communications interface module.
(e) Provide spare I/O cards in quantities corresponding to 10% (rounded up) of the total quantity of each type of card provided. At least one (1) spare shall be provided for each type of I/O card.
(2) Provide ten (10) spare fuses of each type used including those used in power supplies, processor and all I/O cards.
(3) Ethernet Switches: Provide one (1) spare of each type of switch used.
2. Software:
a. Soft copy of PLC and OIT programs including programming comments.
b. Where external applications are required and not embedded within the equipment, provide original software on USB, SD, or other flash drive media containing all configuration files and applications associated with managed Ethernet switches, and similar configurable devices.
c. Organize and submit all software copies with individually labeled items.

1.06 QUALITY ASSURANCE:

A. Materials and Equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall be the manufacturer's latest standard design that has been in satisfactory use for at least 1 year prior to Bid opening.
B. Fabricator Qualifications:
1. Prior to assembly and installation, submit data of fabricator's experience and qualifications.
2. Fabrication shall be by a manufacturer or a particular division of a manufacturing firm specializing in control panel construction.
3. Shall have experience in control panel fabrication.
4. Panel shall be fabricated in a UL listed panel shop.
C. Factory Tests:
1. The manufacturer shall conduct tests according to industry standard requirements.
2. Perform factory tests on all control panels and components and subassemblies to assure that all devices and systems are in proper working order before delivery to jobsite.

3. Test all power, control, and communication systems for proper operation.
4. Simulate actual system operation.
5. Submit test reports as specified in Division 1.

D. All control panels and associated equipment shall conform to the requirements of NEMA ICS and UL 508A standards.

1.07 DELIVERY, STORAGE, AND HANDLING:

A. Control panels and associate equipment shall be packaged and shipped to the project site in such a manner as to avoid damage.
B. All control panels shall be stored according to the manufacturer's instructions and in a conditioned space to avoid condensation, dust, and other environmental contaminants.

1.08 PROJECT SITE CONDITIONS:

A. Do not store or install the control panel equipment specified herein until designated installation spaces are suitable for intended service.
B. For indoor control panels final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing panel and shall be maintained for the remainder of the construction period.

1.09 WARRANTY:

A. Surge Protective Devices shall be provided with a minimum 5-year manufacturer's warranty.
B. Ethernet switches shall be provided with a minimum 5-year manufacturer's warranty.
C. All other equipment shall be provided with a minimum one-year warranty period.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Enclosures:
   1. B-Line, Eaton.
   2. Hoffman, Pentair PLC.
   3. Wiegmann, Hubbell, Inc.
   4. Milbank Manufacturing Company.
   5. Rittal, Inc.
   6. Saginaw Control & Engineering.
B. Classified Area Enclosures:
   1. Appleton, Emerson Electric Company.
   2. Killark, Hubbell, Inc.
C. Thermal Management Components:
   1. Finder Relay's Inc.
   2. Hoffman, Pentair PLC.
   3. Noren Products, Inc.
   4. Pfannenberg.
   5. Rittal, Inc.
   6. Saginaw Control & Engineering.
D. Motor Starters, Circuit Breakers, and Transformers:
   1. ABB.
   2. Acme Electric, Hubbell, Inc.
   3. Allen-Bradley, Rockwell Automation, Inc.
   4. Eaton.

5. Phoenix Contact.
6. Square D, Schneider Electric.

E. Variable Frequency Drives:
1. ABB.
2. Allen-Bradley, Rockwell Automation.
3. Eaton.
4. Danfoss.
5. Schneider Electric.
6. Yaskawa America, Inc.

F. Surge Protective Devices:
1. Advanced Protection Technologies, Inc.
2. Citel, Inc.
3. ASCO/EDCO, Vertiv Co.
4. Ferraz Shawmut, Mersen.
5. MCG Surge Protection, Inc.
6. MTL Instruments, Eaton.
7. Phoenix Contact.
8. Square-D, Schneider Electric.

G. Terminal Blocks:
1. Allen-Bradley, Rockwell Automation, Inc.
2. Buchanan, Tyco Electronics Corporation.
3. Phoenix Contact.
4. Square-D, Schneider Electric.
5. Weidmuller.

H. Push Buttons, Selector Switches and Pilot Lights:
1. Allen-Bradley, Rockwell Automation, Inc.
2. Eaton.
3. IDEC Corporation.
4. Killark, Hubbell, Inc.
5. Square-D, Schneider Electric.

I. Control and Timing Relays:
1. Allen-Bradley, Rockwell Automation, Inc.
2. Eaton.
3. Finder Relay’s Inc.
4. IDEC Corporation.
5. Phoenix Contact.
6. Potter & Brumfield, Tyco Electronics Corporation.
7. Square-D, Schneider Electric.
8. Turck, Inc.

J. Intrinsically Safe Barriers:
1. MTL Instruments, Eaton.
2. Pepperl+Fuchs.
3. Square-D, Schneider Electric.
4. Turck, Inc.

K. DC Power Supplies:
1. Allen-Bradley, Rockwell Automation, Inc.
2. Phoenix Contact.
3. PULS.
4. SolaHD, Emerson Electric Company.

L. Uninterruptible Power Supplies (UPS):
   1. Refer to Section 26 33 53 – Static Uninterruptible Power Supply.
M. Receptacles:
   1. Cooper Industries, Eaton.
   2. Hubbell, Inc.
   3. Leviton Manufacturing Co., Inc.
   4. Phoenix Contact.
N. Interior Illumination:
   1. Acuity Brands, Inc.
   2. Finder Relay's Inc.
   3. Hoffman, Pentair Inc.
   4. Hubbell, Inc.
   5. Stego, Inc.
O. Fiber-Optic Cable Connectors, Duplex Jumpers, Patch Panels and Accessories:
   1. Refer to Section 40 66 00 – Network and Communications Equipment.
P. Ethernet Switches:
   1. Refer to Section 40 66 00 – Network and Communications Equipment.
Q. Industrial Media Converters:
   1. Refer to Section 40 66 00 – Network and Communications Equipment.
R. Programmable Logic Controllers (PLC):
   1. Allen-Bradley, Rockwell Automation.
S. Distributed I/O Modules:
   1. Allen-Bradley, Rockwell Automation.
T. Operator Interface Terminal (OIT):
   1. Allen-Bradley, Rockwell Automation.
U. Wiring Duct:
   1. Panduit Corporation, H-Type.
   2. Thomas and Betts Corporation, ABB Group.
V. Wire Markers:
   1. Brady Worldwide, Inc.
   2. Panduit Corporation.
   3. Thomas and Betts Corporation, ABB Group.
W. Wire Terminals and Connectors:
   1. Refer to Section 26 05 19 – Low Voltage Electrical Conductors and Cables.

2.02 ENCLOSURES:

A. Totally enclosed panel with gasketed doors, continuous hinge, and three point latching mechanism with lockable handle.
B. Sized to house all equipment and devices required, provide sufficient space for conduit entry, and provide sufficient heat dissipation for the installed components.
C. Unless specified or indicated otherwise provide the following NEMA 250 approved enclosure type(s):
   1. NEMA Type 4X aluminum, 304 stainless steel or 316 stainless steel enclosures for the following areas:
      a. Outdoor and process area locations.
   2. NEMA Type 4X fiberglass enclosures with 316 stainless steel latches for the following areas:
      a. When specified for chemical feed and chemical compatibility.
   3. NEMA Type 12 painted steel enclosures for the following areas:

a. Indoor conditioned spaces.

4. NEMA Type 3R painted steel ventilated enclosures for the following areas:
   a. Plant entrance security network enclosure.

D. Unless specified or indicated otherwise provide the following enclosure design:
   1. Wall Mount Design:
      a. Provide for enclosures with a vertical dimension less than 50-inches.
      b. Formed and welded construction, minimum 14-gauge.
      c. Interior 12-gage minimum steel mounting panel(s).
      d. Provide mounting tabs and required hardware for installation of enclosures.
   2. Free Standing and Floor Mount Design:
      a. Provide for enclosures with vertical dimensions of 50-inches or greater.
      b. Formed and welded construction, minimum 12-gauge for single door enclosures. For multi-door enclosures provide a 10-gauge back.
      c. Interior 10 or 12-gage steel mounting panel(s).
      d. Provide door mounted folding shelf for support of instruments and test equipment. Shelf shall be mounted on the interior of the door. For multi-door enclosures provide a shelf for each pair of doors.
      e. Provide with lifting eyes.

E. Provide lockable design.

F. Painted enclosures shall have a light gray polyester powder coat finish on the exterior with a white polyester powder coat finish on the interior.

G. Accessories:
   1. Provide data pocket mounted on the interior of the panel for storage of wiring diagrams.
   2. Provide vapor action corrosion inhibitor emitters for each panel. Emitters shall be provided as a minimum based upon twice the calculated volume of the enclosure.
   3. Provide a door stop kit designed to secure the door in the 90-degree open position.

H. Shall comply with UL 50, UL 508A, and NEMA ICS 6 standards.

2.03 THERMAL MANAGEMENT:

A. Electric Heaters:
   1. Provide a forced air panel heater for each exterior mounted control panel.
   2. Heater shall be sized to maintain an interior panel temperature of 40°F.
   3. Integral thermostat adjustable from 0°F to 100°F.
   4. Rigid metal housing.
   5. Motor shall be thermally protected.
   6. Ball bearing fan shall run continuously to distribute heat throughout panel.
   7. Powered from 120Vac.
   8. Provide all required mounting brackets for complete installation in the panel.

B. Ventilation Fans (For control panels installed in conditioned spaces only):
   1. Provide as required to maintain panel temperature below component ratings.
      a. Heat gain calculations shall be provided for enclosures containing VFDs and motor controlling equipment.
   2. Provide for the following panels:
      a. NEMA 12 panels with PLCs installed. Electrical rooms only.
   3. Provide a compact 6-inch fan with rigid metal housing with finger guard. Motor shall be thermally protected and bearings shall be permanently lubricated ball bearings and design for a minimum of 50,000 hours of continuous operation. Impeller shall be polycarbonate. Powered from 120Vac.

4. Provide 14-gage steel louver for the intake and exhaust openings. Louver finish shall match the finish on the panel. Provide an aluminum filter and gasket for each louver.
5. Provide all required mounting brackets for complete installation in the panel.
6. Temperature Control Switches:
    a. Provide two temperature control switches for each panel, one for control of the exhaust fan, and one for the high temperature alarm as indicated.
    b. The temperature control switches shall have an adjustable range of 30°F to 140°F.
    c. The temperature switch contact shall close on temperature rise and be rated 15A at 120Vac.
    d. Designed for DIN rail mounting.
    e. The high temperature alarm switch shall be set at 100°F and the fan switch shall be set at 85°F.

C. Closed-Loop Air Conditioning System:
1. Provide a closed-loop mechanical refrigeration air conditioning system for the following panels:
    a. Control Panels Containing VFDs located outdoor or in unconditioned indoor process areas.
2. The air conditioning system shall be selected to maintain the NEMA rating of the enclosure. The construction material shall match the associated panel.
3. The system shall be capable of maintaining a temperature of 85°F inside the enclosure under the following conditions:
    a. All equipment in the panel operating.
    b. Continuous exposure to sunlight.
    c. Exterior ambient air temperature of 104°F.
4. The compressor and condenser shall be located outside the control panel enclosure.
5. Provisions shall be made to remove condensate from the control panel and to protect all devices within the enclosure from condensate.
6. Manufacturer shall submit sizing calculations for each panel listed above.

D. Temperature Transmitters:
1. Provide a temperature transmitter for room ambient air measurement for the following panels:
    a. PCS Control Panels in Electrical Rooms.
2. Shall be connected to the panel PLC and provided for remote temperature monitoring.
3. Provide loop powered temperature transmitter for monitoring of air temperature.
4. Spring loaded platinum RTD sensing element.
5. Provide compact stainless steel sensing element when used for ambient air sensing applications.
6. Provide 4-20mA analog signal proportional to temperature.
7. Provide DIN rail mounted housing for mounting within control panel.

2.04 CLASSIFIED AREA ENCLOSURES:

A. NEMA Type 7 enclosure suitable for installation in a Class 1 Division 1, Group D area.
B. Cast copper-free aluminum enclosure with stainless steel hinges and O-ring gasket.
C. Stainless steel cover bolts.
D. Stainless steel mounting tabs.
E. Aluminum interior mounting panel.
F. Sized to house all equipment and devices required, provide sufficient space for conduit entry, and provide sufficient heat dissipation for the installed components.

G. Provide vapor action corrosion inhibitor emitters for each panel. Emitters shall be provided as a minimum based upon twice the calculated volume of the enclosure.
H. Shall comply with UL 50, UL 508A, and NEMA ICS 6 standards.

2.05 NAMEPLATES:
A. Fabricate from laminated phenolic sheeting with black core and satin finish melamine overlay.
B. Colors shall white with black letters.
C. Thickness: 1/16 inch nominal.
D. Bevel edges to expose black core on perimeter.
E. Engraved legend through overlay to expose core.
F. Attach to panels with industrial grade double-faced tape.
G. Refer to Section 26 05 53 – Identifications for Electrical Systems for additional labeling requirements.

2.06 CIRCUIT BREAKERS:
A. 480Vac:
1. Protective devices shall be molded case circuit breakers with thermal-magnetic trip units and inverse time and instantaneous tripping characteristics.
2. Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make, quick-break over-center switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the handle position.
3. Circuit breakers shall have a minimum symmetrical interrupting capacity of 18,000 AIC. Higher ratings when indicated or required to comply with short-circuit coordination study.
4. Main circuit breakers shall be provided with a door interlocked remote operator kit suitable for installation in provided enclosure. The main disconnect shall be lockable in the off position.
5. Number of poles and ampere rating as required.
B. 120/240Vac and 24Vdc:
1. Provide for main disconnecting means for panel and for power distribution within the panel as indicated.
2. Rated for 120/240Vac and 24Vdc as indicated.
3. Thermal-magnetic trip units.
4. Trip rating and curve as recommended by manufacturer of equipment being protected.
5. DIN rail mounted on the inside of the control panel in a readily accessible location.
6. Toggle-type handle with a quick-make, quick-break over-center switching mechanism that is mechanically trip-free.
7. Minimum symmetrical interrupting capacity of 10,000 AIC.
C. Main and branch circuit breakers shall be UL 489 listed. Supplementary protectors for electronic equipment within control panel shall be UL 489 or UL 1077 listed.

2.07 MOTOR STARTERS:
A. Provide full-voltage reversing or non-reversing starters as required.
B. General:
1. Each starter sized according to horsepower rating of motor.
2. Auxiliary contacts as required.
3. Selector switches, push buttons and indicating lights for motor starters as indicated, specified and required.
4. Comply with NEMA ICS 2.

C. Full-Voltage Reversing or Non-Reversing Starters:
   1. Equipped with a motor circuit protector (MCP).
      a. Toggle-type operating handle shall clearly indicate when the MCP is "ON," "OFF," or "TRIPPED".
      b. Molded-case, manually-operated, 3-pole.
      c. The MCP shall provide adjustable magnetic protection and be provided with pin insert to limit magnetic adjustable protection to a maximum of 1700% of motor nameplate full load current to comply with NEC requirements.
      d. Equipped with a push-to-test button.
      e. Shall include transient override feature for inrush current.
   2. Minimum starter size NEMA Size 1.
   3. Solid-State Overload Relay:
      a. Provide with solid-state, self-powered overload relay sized for and adjusted to full load current of motor being protected.
      b. Selectable Trip Class. Trip Class shall be selected as recommended by the motor manufacturer to protect the motor.
      c. Provide a minimum [4][5]:1 adjustment range matched to NEMA contactor sizes 00-6.
      d. Overload relay shall provide phase loss protection.
      e. Selectable Manual/Auto-Manual reset.
      f. Relay shall have a visible trip indication with remote push button reset.

2.08 VARIABLE FREQUENCY DRIVES (VFD):

A. General Requirements:
   1. VFD shall be microprocessor based and utilize Pulse Width Modulation (PWM) for speed control of an induction motor.
   2. The VFD shall utilize Insulated Gate Bipolar Transistors (IGBT's).
   3. The VFD shall be sized to operate the connected motor.
   4. The VFD shall be capable of producing a variable AC voltage/frequency output to provide continuous operation of a standard induction motor over a 5-100% speed range.
   5. As a commissioning and troubleshooting feature, the VFD power circuit shall be capable of operating without a motor connected to the VFD output.
   6. VFD rated for variable torque loads shall be capable of a momentary overload of 110% for one minute.
   7. VFD rated for constant torque loads shall be capable of a momentary overload of 150% for one minute.
   8. Comply with NEMA ICS 7.
B. Input Harmonics:
   1. Provide with input 5% line reactor and EMI/RFI filter.
C. Input Protection:
   1. Provide with an input circuit breaker.
      a. Shall be provided with an external handle that clearly indicates when the circuit breaker is "ON", "OFF", or "TRIPPED" and be lockable in the "OFF" position.
      b. Molded-case, manually-operated, 3-pole.
      c. Provide instantaneous and thermal magnetic short circuit protection.
D. Motor Compatibility:
   1. Motor life expectancy shall not be compromised in any way by operation with the VFD system. The VFD shall provide motor overload protection in any operating condition.

2. The VFD output waveform shall be suitable for operating a squirrel cage induction motor without derating or requiring additional service factor.
3. The system design shall not have any inherent output harmonic resonance in the operating speed range.
4. The VFD output shall produce no electrically-induced, pulsating torque to the output shaft of the mechanical system eliminating the possibility of exciting a resonance caused by VFD induced torque pulsations.
5. The VFD shall protect the motor from high-voltage dv/dt stress which would cause insulation breakdown of an "inverter ready" motor. If the VFD requires an output filter to meet this requirement, it shall be provided.
6. As a minimum, an output filter shall be provided for motor lead lengths longer than 100 feet.

E. VFD System Efficiency: Guaranteed minimum total VFD system efficiency shall be a minimum 96% at 100% speed.

F. System Input Power Factor: VFD system shall maintain a 95% minimum power factor from 30% to 100% of rated speed.

G. Speed Regulation: VFD speed regulation shall be ±0.5% without encoder or tachometer feedback.

H. Sound Level: Maximum allowable audible noise from the VFD system will be 80 dB(A) at a distance of one meter (3.3 ft) at any speed or load condition. VFD systems with audible noise in excess of this limit shall be provided with sufficient noise abatement treatment to reduce the sound pressure level below 80 dB(A).

I. Availability and Reliability:
1. Firing Signals: All internal firing signals and other communications (which link operational controls with power components such as status and diagnostic signals) shall meet noise immunity and safety requirements as defined by applicable IEEE Standards.
2. Power Sag Ride-Through: The VFD system shall be capable of continuous operation with a 20% voltage sag on the input power line.
3. "Catch-A-Spinning-Load" Capability: The VFD system shall be able to catch and take control of a spinning load if started while rotating equipment is already spinning. Appropriate safeguards shall be included in this operation to prevent damaging torque(s), voltages or currents from impacting any of the equipment. The user shall have the option of employing this feature or disabling it.
4. Auto-Restart Capability: The VFD system shall be capable of automatically restarting in the event of a power failure or drive trip. The VFD system shall provide the user with the choice of automatically restarting or not. The user shall be able to selectively apply this feature to some [but not necessarily all] conditions as determined by the user to be appropriate for the specific application.
5. Ground Fault Withstand: In the event of a ground fault, the VFD shall annunciate the ground fault condition and trip offline to clear the fault. The cause of the shutdown shall be logged to the fault history and be available at the keypad.

J. Physical Requirements:
1. Environmental Requirements: The VFD system shall be capable of continuous operation in an average ambient temperature between 0°C and 40°C at an elevation up to 3300 feet (1000 meters) above MSL without derating. The VFD system shall also be simultaneously suitable for continuous operation in a maximum humidity between 0 and 95% noncondensing.
2. The VFD system shall be air-cooled.

K. Protective Features and Circuits:

1. The controller shall include the following alarms and protective features:
   a. Static instantaneous over-current and over-voltage trip.
   b. Under-voltage and power loss protection.
   c. Over-temperature protection.
   d. Electronic motor inverse time overload protection.
   e. When power is restored after a complete power outage, the VFD shall be capable of catching the motor while it is still spinning and restoring it to proper operating speed without the use of an encoder.
2. The VFD system shall be protected from damage due to the following, without requiring an output contactor:
   a. Single-phase fault or three-phase short circuit on VFD system output terminals.
   b. Loss of input power due to opening of VFD input disconnect device or utility power failure during VFD operation.
   c. Loss of one (1) phase of input power.
   d. Motor regeneration due to backspin or loss of VFD input power.
3. The VFD shall be able to withstand the following fault conditions without damage to the power circuit components:
   a. Failure to connect a motor to the VFD output.
   b. VFD output open circuit that may occur during operation.
4. The VFD shall include a customer selectable automatic restart feature. When enabled, the VFD shall automatically attempt to restart after a trip condition resulting from over-current, over-voltage, under-voltage, or over-temperature.
5. The VFD system shall have the user selectable option of programming up to three speed avoidance bands. This gives the user the ability to block out and prevent operation at any undesirable speed, such as one that may be coincident with a mechanical resonance condition.

L. Diagnostics and Fault Recording:
1. The control logic section shall be fully digital and not require analog adjustment pots or fixed selector resistors.
2. Fault log data shall be stored in nonvolatile memory.
3. The VFD shall include a comprehensive microprocessor based digital diagnostic system which monitors its own control functions and displays faults and operating conditions.
4. A "FAULT LOG" shall record, store, and display upon demand, a minimum of the last four fault events.

M. Interfaces:
1. Keypad and Display:
   a. A unit mounted keypad with integral digital LCD display shall be furnished, capable of controlling the VFD and setting drive parameters. The display shall present all diagnostic message and parameter values in standard engineering units when accessed, without the use of codes. The keypad shall allow the operator to enter exact numerical settings in standard engineering units. A plain English user menu (rather than codes) shall be provided in software as a guide to parameter setting.
   b. As a minimum, the following parameters shall be available for display:
      (1) Speed demand in percent.
      (2) Output current in amperes.
      (3) Output Frequency in hertz.
      (4) Output voltage.
      (5) Total 3-phase kW output.

(6) Kilowatt hour meter.
(7) Elapsed time running meter.
(8) Run status.
(9) Fault status.

c. Drive parameters shall be factory set in non-volatile memory and re-settable in the field through the keypad. Password security shall be available to protect drive parameters from unauthorized personnel.

d. The keypad module shall contain a "self-test" software program that can be activated to verify proper keypad operations.

N. Hard-Wired I/O and Control Devices:

1. The VFD shall include programmable I/O for application specific configuration. The drive shall be configurable to operate in a local and remote mode. The drive shall provide for the following programmable input/output points to be associated with the control functions:

a. Digital Inputs:
(1) Provide a minimum of 6 fully programmable inputs configured, as indicated.

b. Digital Outputs:
(1) Form C Relay. Dry Contact rated a minimum of 2 Amps at 120Vac:
(2) Provide a minimum of 2 fully programmable outputs configured, as indicated.

c. Analog Input:
(1) One 4-20 mA isolated input to control drive output (motor speed) when indicated.

d. Analog Output:
(1) One 4-20 mA isolated output signal representing drive speed and scaled 0 100%.

O. Communication and Protocols:

1. The VFD shall be capable of direct communication to a laptop or computer workstation for serial link setup of parameters, fault diagnostics, trending and diagnostic log downloading.

2. The VFD shall be provided with an Ethernet communication card capable of communicating on a Ethernet/IP network when specified or indicated for the associated control panel.

a. All control functions including start/stop and speed control shall be available via the network.

b. VFD status and I/O shall be available via the network.

3. Provide a complete list of available control and indication points including the required documentation for network configuration.

P. Printed Circuit Boards: All printed circuit boards shall be new. They shall be conformably coated for moisture and chemical resistance, in addition to any dielectric coating properties.

2.09 CONTROL POWER TRANSFORMERS:

A. Rated 480-120/240 Vac, 1-phase, 3-wire, 60 hertz.
B. Varnish impregnated core and coil.
C. 55°C rise with a 105°C insulation system.
D. Finger safe terminal blocks.
E. Transformers 3kVA and above shall be mounted on the exterior of the panel.

1. The transformer enclosure shall match the rating of the associated control panel.

2.10 SURGE PROTECTIVE DEVICES:

A. 480V Surge Suppressors:
1. Provide for 480Vac distribution system within panel.
2. UL 1449 (3rd Edition) listed.
3. Shall meet Type 2 SPD criteria with the following minimum protection characteristics:
   a. I_n: 20kA (per mode)
   b. SCCR: 100kAIC (minimum)
   c. MCOV: 550V
   d. UL Voltage Protection Rating:
      (1) L-L: 1800V
      (2) L-N, L-G, N-G: 900V
4. Designed for 480Vac, three-phase operation.
5. Minimum surge current capacity (I_{max}) of 40 kA per mode (8/20µs).
6. Response time of less than 25 nanoseconds.
7. Equipped with an LED status indicator for verification that unit is functioning.
8. NEMA 1 enclosure designed for back panel or DIN rail mounting within a control panel.
9. Minimum five year warranty.
10. Provide SPDT contacts for remote indication. Contacts rated 0.5A at 120Vac minimum.

B. 120/240V Surge Suppressors:
1. Provide for 120V/240Vac distribution system within panel to protect electronic components from transient voltage surges.
2. UL 1449 listed.
3. Shall meet Type 2 SPD criteria with the following minimum protection characteristics:
   a. I_n: 20kA (per mode)
   b. SCCR: 100kAIC (minimum)
   c. MCOV: 150V (L-G), 270 (L-L).
   d. UL Voltage Protection Rating:
      (1) L-L: 1000V
      (2) L-N, L-G, N-G: 600V
4. Designed for 120/240Vac, single-phase operation.
5. EMI/RFI filtering.
6. Peak clamping voltage of 320 volts line to neutral and 350 volts line to ground with Category B waveform.
7. Minimum surge current capacity of 10 kA per mode (8/20µs).
8. Response time of less than 25 nanoseconds.
9. Equipped with an LED status indicator for verification that unit is functioning.
10. NEMA 1 enclosure designed for back panel or DIN rail mounting within a control panel.
11. Minimum five year warranty.
12. Provide SPDT contacts for remote indication. Contacts rated 0.5A at 120Vac minimum.

C. Panel I/O Surge Suppressors:
1. Provide DIN rail mounted terminal block type transient voltage surge suppressors for all inputs and outputs that are wired to devices located outside of the building envelope.
2. Finger safe screw type terminals.
3. Replaceable surge modules.
4. Three-stage surge protection.
5. Provisions for labeling terminal block numbers.
6. Minimum five year warranty.
7. Analog and 24Vdc Signal Surge Protection:
   a. Series surge suppressor.

b. Minimum surge current capacity of 10 kA per mode (8/20µs).
c. Minimum lightning surge current capacity of 500A per path (10/350µs).
d. Maximum let thru voltage line to ground of 45 Vdc.
e. Maximum let thru voltage line to line of 90 Vdc.
f. Response time of less than 5 nanoseconds.
g. Maximum series resistance of 10 ohms.
h. Minimum continuous current rating of 300 mA.

8. 120Vac Discrete Signal Surge Protection:
   a. Series surge suppressor.
   b. Minimum surge current capacity of 4 kA per mode (8/20µs).
   c. Minimum lightning surge current capacity of 2.5 kA per path (10/350µs).
   d. Maximum let thru voltage line to ground 380 Vac.
   e. Maximum let thru voltage line to line of 600 Vac.
   f. Minimum continuous current rating of 10A.
   g. Continuous current rating shall be increased for individual suppressor blocks when the load exceeds the minimum rating.
   h. Response time of less than 25 nanoseconds.

D. Shall be designed to pass the appropriate IEEE testing standards included below:
1. IEEE C62.11.
2. IEEE C62.33.
3. IEEE C62.36.
4. IEEE C62.45.
5. IEEE C62.62.

2.11 TERMINAL BLOCKS:

A. 600V, sectional type polyamide blocks.
B. Rated a minimum of 24A. Provide higher Amp rated blocks as required.
C. Spring-cage connection type.
D. Finger safe.
E. Slide in vinyl marking strip for terminal identification.
F. DIN rail mounted.
G. Terminal blocks shall comply with NEMA ICS 4.

2.12 SWITCH ACTION FUSE BLOCKS:

A. Rated 600V.
B. Spring-cage connection type.
C. Finger safe.
D. DIN Rail mounted.

2.13 PUSH BUTTONS AND SELECTOR SWITCHES:

A. Heavy duty, 30 mm units with contacts rated 10A continuous at 120Vac.
B. NEMA 4X rated when installed in NEMA 12 or 4X enclosures.
C. Provide the number of contacts and contact development as indicated.
D. Operator colors shall comply with UL 508A and NFPA 79.
1. Start or On push buttons shall have green or black operators.
2. Stop or Off push buttons shall have black operators.
E. Emergency Stop push buttons shall have red mushroom head operators with a yellow base.
F. Provide hermetically sealed units when installed within a classified area.
1. Suitable for installation in a Class I, Division 1 and 2, Group D area.

G. Push Buttons and Selector Switches shall conform to NEMA ICS 5.

2.14 PILOT LIGHTS:

A. Heavy duty, 30 mm units.
B. NEMA 4X rated when installed in NEMA 12 or 4X enclosures.
C. NEMA 4X and suitable for installation in a Class I, Division 1 and 2, Group D area when installed in NEMA 7 enclosures.
D. 120Vac or 24Vdc cluster LED type.
E. Green lights shall indicate “Equipment On”,“Running”, or “Valve Open”.
F. Red lights shall indicate “Equipment Off”, “Stopped”, or “Valve Closed”.
G. Amber lights shall indicate “Equipment Failure” or “Alarm”.
H. Push-to-test type.
I. Pilot lights shall conform to NEMA ICS 5.

2.15 CONTROL RELAYS:

A. Plug-in type relay with neon coil energization indicator.
B. Coil voltage: 120Vac or 24Vdc as required.
C. Contacts rated 10 Amps at 120Vac.
D. Number of contacts as required.
   1. Provide one spare N.O. and one spare N.C. contact (minimum).
   2. Additional spare contacts when indicated.
E. Provide DIN rail mounted relay socket with screw type terminations.
F. Control relays shall conform to NEMA ICS 5.

2.16 TIME DELAY RELAYS:

A. Plug-in type digital based electronic timing relay with coil energization indicator.
B. Coil voltage: 120Vac or 24Vdc as required.
C. Contacts rated 10 Amps at 120Vac.
D. Timing range as indicated with a minimum setting accuracy of ±2% and repeat accuracy of ±0.1%.
E. The selection of timing range settings via DIP switches. The time delay within the range shall be set utilizing an adjustment dial.
F. Number of contacts as required.
   1. Provide one spare N.O. and one spare N.C. contact (minimum).
   2. Additional spare contacts when indicated.
G. Provide DIN rail mounted relay socket with screw type terminations.
H. Time delay relays shall conform to NEMA ICS 5.

2.17 INTRINSICALLY SAFE BARRIERS:

A. Intrinsically Safe Barrier Relays:
   1. Supply voltage 120Vac.
   2. Approved intrinsically safe for Class 1, Division 1, Group D areas.
   3. Accept a dry contact input.
   4. Two SPDT relay outputs rated 5A at 120Vac.
   5. LED indication of relay state.
B. Intrinsically Safe Barrier Transmitters:
   1. 24Vdc regulated power supply input.
   2. 2 wire, 4-20mA transmitter type.
   3. 4-20mA safe area output.

4. Approved intrinsically safe for Class 1, Division 1, Group D areas.

2.18 DC POWER SUPPLIES:

A. Provide industrial rated primary switched 24Vdc power supplies as specified and indicated.
B. Enclosed design with finger safe input and output terminal blocks.
C. Designed for DIN rail or back panel mounting.
D. DC power supply rated as follows:
   1. Input voltage: 95 to 130Vac.
   2. Output voltage: 24Vdc ±1%.
   3. Output current: 10A minimum. with a minimum 25% spare capacity.
   4. Line regulation: ±0.2% maximum.
   5. Load regulation: ±1.5% maximum.
   6. Ripple: <50 mV pk-pk.
   7. No overshoot for turn on, turn off, or power failure.
   8. Operating temperature: -25°C to +60°C.
   9. Overload and short circuit protection.
   10. Indicating lights for status.
E. DC UPS System:
   1. Provide DC power supplies equipped with a UPS System for the following control panels:
      a. Outdoor security, network, or PCS cabinets not supplied by a centralized UPS power supply.
   2. Shall charge and monitor the battery.
   3. Shall automatically switch without interruption to battery power if the primary 120Vac source is lost and switch back automatically to the 120Vac source when power is restored.
   4. The UPS system shall utilize maintenance free lead-acid batteries rated a minimum of 7Ah to provide a minimum of 60 minutes of backup time for the connected load.
   5. Provide a support rack for the batteries designed for DIN rail or back panel mounting.
   6. Equipped with a resettable over current protection to protect the batteries.
   7. The batteries shall be field replaceable.
      a. The unit shall be equipped with an on/off switch to bypass the battery system and allow for replacement of the batteries while the power supply is in operation.
   8. The system shall provide relay outputs rated a minimum of 0.25A at 24Vdc to indicate the following:
      a. AC Power Failure.
      b. Low Battery.
   9. Conform to UL 1778.
F. Redundancy Module.
   1. Provide DIN rail mounted redundancy diode module that provides complete isolation between two 24Vdc power supplies as required.
   2. Unit shall accept two 24Vdc inputs and provide one redundant 24Vdc output.
   3. Current rating as required.
   4. Operating temperature: -25°C to +60°C.
   5. Provide status light and dry output contact that opens when either of the 24Vdc inputs is lost. Output contact shall be rated a minimum of 2 Amps at 30Vdc.

2.19 CONVENIENCE RECEPTACLES:

A. Interior Mounted Receptacle:

1. DIN rail mounted, 15-A duplex three-wire grounding GFCI type receptacle with enclosure.
2. Equipped with terminal blocks for power connection.
3. Outlet shall be protected with a 5 Amp circuit breaker.
4. One mounted inside control panel for use in powering laptops and test equipment for service of the panel.

2.20 INTERIOR ILLUMINATION:

A. Provide LED type panel lights.
B. Minimum 50,000 hour life.
C. Size and quantity designed to provide a minimum 50 foot-candles at the base of the panel.
D. Powered from 120Vac. Provide required power supply.
E. Door interlocked switch.

2.21 FIBER-OPTIC PATCH PANELS AND PATCH CORDS:

A. Provide fiber-optic patch panels in control panels as indicated and specified. Refer to Section 40 66 00 – Network and Communications Equipment for requirements.

2.22 PANEL MOUNT NETWORK SWITCHES AND NETWORK ACCESSORIES:

A. Provide Ethernet switches as indicated and specified. Refer to Section 40 66 00 – Network and Communications Equipment for requirements.

2.23 PROGRAMMABLE LOGIC CONTROLLERS (PLC):

A. Provide Allen-Bradley ControlLogix series PLC hardware as specified and indicated for plant control system (PCS) Cabinets.
   1. General:
      a. The PLC platform shall consist of PlantPAx System listed components and architecture.
      b. The programmable controller shall receive status intelligence, perform logic functions, issue control commands, and provide alarms and status information for the systems described in these Specifications.
      c. The PLC shall support the following programming languages:
         (1) Relay ladder.
         (2) Structured text.
         (3) Function block.
         (4) Sequential function charts.
      d. The programmable controller Equipment shall consist of a solid-state control system which has user programmable memory for storage of instructions to implement specific functions.
      e. The PLC Equipment shall be purposely designed as an industrial control system which can perform functions equivalent to a relay panel or a wired solid-state logic system.
      f. All PLC Equipment provided shall be capable of operation in ambient temperatures of 0°C to 60°C, and 5 to 95% relative humidity (non-condensing), without fans or other cooling equipment.
      g. All external connection points shall be capable withstanding the IEEE surge withstand capability (SWC) test as defined in IEEE C37.90.1.
      h. The PLC's shall be capable of being configured as a redundant controller.
   2. Chassis:

a. Provide PLC chassis as required to accommodate the I/O and communications modules required and indicated.
b. Provide slot fillers for all unused chassis spaces.

3. Power Supplies:
   a. Provide power supplies for the processor chassis and expansion chassis as required.
   b. Power supply shall be sized to supply required power for all installed modules and any spare spaces within the chassis.
   c. Input voltage shall be 120Vac as indicated.
4. Processor:
   a. The processor shall be an Allen Bradley model 1756-L81EP.
   b. The processor shall be of solid-state design on modular printed circuit boards.
   c. The processor shall be equipped with a USB 2.0 communications port for programming.
   d. The processor shall have user-programmable memory with provisions to prevent unauthorized changes.
   e. The processor shall be equipped with a minimum of 3 Mbytes of user memory.
      (1) The complete memory capacity specified shall be available for use by the user.
      (2) Memory shall be SDRAM
   f. The processor shall continuously perform diagnostics analysis with a predetermined failure mode in the event of a fault.
   g. The ladder diagram logic shall be scanned and solved at a rate not to exceed 1 milliseconds per kiloword of logic.
   h. All I/O including analog shall be scanned and updated at a rate not to exceed 0.3 milliseconds for all I/O.
   i. The ladder logic programming shall include support for subroutines.
   j. The processor shall include a real time clock and calendar accessible for use by the user program.
   k. The processor shall have at least two (2) operating modes: Run and Program. These operating modes shall be user changeable via front panel switches and over the PLC communications network.
   l. The processor shall allow the logic to be modified, in ladder logic format, while the processor is in the Run mode without affecting the operation of those portions of the logic not being modified.
   m. The processor shall allow disabling and forcing on and off of individual input and output when the processor is in the Run mode.
   n. The processor shall provide selectable timed interrupt capabilities for the user to incorporate into the ladder logic.
   o. The processor shall provide user defined fault routine capabilities.
   p. The processor shall automatically clear all output and update all input on power-up and prior to scanning and solving any logic.
   q. The processor shall provide the user with a status bit for use in the ladder logic for initialization purposes. This status bit shall be set/reset based on the indicating the first ladder logic scan.
   r. The processor shall provide a comprehensive instruction set including:
      (1) Relay Contact Input:
         (a) Normally open.
         (b) Normally closed.
         (c) Transitional.

(2) Relay Coil Output:
  (a) Standard.
  (b) Retentive.
(3) Timers:
  (a) On delay.
  (b) Off delay.
  (c) Duration.
  (d) Retentive
  (e) Time bases of 1.0 sec, 0.1 sec, and 0.01 sec.
(4) Counters:
  (a) Count up.
  (b) Count down.
(5) Arithmetic:
  (a) Single-precision.
  (b) Double-precision.
  (c) Integer.
  (d) Add.
  (e) Subtract.
  (f) Multiply.
  (g) Divide.
  (h) Square root.
  (i) Less than.
  (j) Greater than.
  (k) Equal.
(6) Logical:
  (a) And.
  (b) Or.
  (c) Exclusive or.
  (d) Compare.
(7) PID.

5. Communications Hardware:
  a. Provide EtherNet/IP communication modules as indicated for communications via an Ethernet PLC communications network.
    (1) All data within a PLC shall be accessible to any operator station or PLC.
      (a) Programming functions shall be possible over the Ethernet communications network.
      (b) Unloading and downloading of programs shall be possible over the Ethernet communications network.
    (2) The operating mode of the PLC shall be changeable via the Ethernet communications network.
    (3) Provide quantity of communication modules to physically segment the PCS operator interface/HMI network from device and motor control I/O networks.
      (a) Each PLC shall incorporate a minimum of one dedicated module for the device I/O communications, or multiple where indicated.
      (b) Each PLC shall incorporate one dedicated module for the PCS operator/HMI network, or dedicated connection through the processor integral Ethernet/IP port as applicable for the supplied processor.
    (4) Provide communications module 1756-EN2T or better.
6. PLC Input and Output Modules:

a. Digital Input Modules:
   (1) Provide module 1756-IA16.
   (2) 120Vac nominal input voltage with an on state voltage of 79 to 132Vac and an off state voltage less than 20Vac.
   (3) Shall have a maximum of 16 inputs per module.
   (4) Maximum hardware input delay time of 10 ms.
   (5) Maximum inrush current of 0.25 Amps.
   (6) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.

b. Relay Output Modules:
   (1) Provide module 1756-OW16I.
   (2) Rated 2.0 Amps nominal at 120Vac.
   (3) Shall have a maximum of 16 individually isolated relay outputs per module.
   (4) Maximum output delay time of 13 ms.
   (5) Make rating of 15 Amps and a break rating of 1.5 Amps at 120Vac.
   (6) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.
   (7) Provide individual surge suppressors for each output to protect module from surges caused by inductive load switching.

a. Digital Output Modules:
   (1) Provide module 1756-OA16I.
   (2) Rated 0.5A per point (4.0A per module) nominal at 120Vac.
   (3) Shall have a maximum of 16 outputs per module.
   (4) Maximum output delay time of 10 ms.
   (5) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.
   (6) Digital output modules shall require the use of interposing relays within the associated control panel for all connected outputs.

b. Analog Input Modules:
   (1) Provide module 1756-IF8I.
   (2) Shall have 8 differential type, 4-20 mA current inputs.
   (3) Each input shall have a minimum 16-bit resolution.
   (4) Provide 2550Vdc channel to backplane isolation.
   (5) Programmable input filter.
   (6) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.

c. Analog Output Modules:
   (1) Provide module 1756-OF8I.
   (2) Eight individually isolated, 4-20 mA current outputs.
   (3) Each output shall have a minimum 16-bit current resolution.
   (4) Provide 1700Vdc channel to channel isolation and channel to backplane isolation.
   (5) Maximum scan time of 25 ms for all channels.
   (6) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.

d. Provide screw clamp removable terminal block connectors for each module.

B. Provide Allen-Bradley CompactLogix series PLC hardware as specified and indicated for vendor supplied packaged control panels.

1. General:
   a. The PLC platform shall consist of PlantPAx System listed components and architecture.
   b. The programmable controller shall receive status intelligence, perform logic functions, issue control commands, and provide alarms and status information for the systems described in these Specifications.
   c. The programmable controller Equipment shall consist of a solid-state control system which has user programmable memory for storage of instructions to implement specific functions.
   d. The PLC Equipment shall be purposely designed as an industrial control system which can perform functions equivalent to a relay panel or a wired solid-state logic system.
   e. All PLC Equipment provided shall be capable of operation in ambient temperatures of 0°C to 60°C, and 5 to 95% relative humidity (non-condensing), without fans or other cooling equipment.
   f. All external connection points shall be capable withstanding the IEEE surge withstand capability (SWC) test as defined in IEEE C37.90.1.
2. Power Supplies:
   a. Provide power supplies for the PLC hardware and any expansion I/O as indicated or required.
   b. Input voltage shall be 120Vac.
3. Processor:
   a. The processor shall be an Allen Bradley model 5069-L320ERP, unless specified otherwise.
   b. The processor shall be of solid-state design on modular printed circuit boards.
   c. The processor shall be equipped with a USB communication port and an Ethernet communication port for programming and communication of data.
   d. The processor shall have user-programmable memory with provisions to prevent unauthorized changes.
   e. The processor shall be equipped with a minimum of 2 Mbytes of user memory.
      (1) The complete memory capacity specified shall be available for use by the user.
      (2) All memory shall be nonvolatile SDRAM.
   f. Provide with a SD memory card slot and a 1GB memory card for storage of the PLC program and other user specific information.
   g. The processor shall continuously perform diagnostics analysis with a predetermined failure mode in the event of a fault.
   h. The ladder diagram logic shall be scanned and solved at a rate not to exceed 1 milliseconds per kiloword of logic.
   i. All I/O including analog shall be scanned and updated at a rate not to exceed 0.3 milliseconds for all I/O.
   j. The ladder logic programming shall include support for subroutines.
   k. The processor shall include a real time clock and calendar accessible for use by the user program.
   l. The processor shall have at least two (2) operating modes: Run and Program. These operating modes shall be user changeable via front panel switches and over the PLC communications network.

m. The processor shall allow the logic to be modified, in ladder logic format, while the processor is in the Run mode without affecting the operation of those portions of the logic not being modified.
n. The processor shall allow disabling and forcing on and off of individual input and output when the processor is in Run mode.
o. The processor shall provide selectable timed interrupt capabilities for the user to incorporate into the ladder logic.
p. The processor shall provide user defined fault routine capabilities.
q. The processor shall automatically clear all output and update all input on power-up and prior to scanning and solving any logic.
r. The processor shall provide the user with a status bit for use in the ladder logic for initialization purposes. This status bit shall be set/reset based on the indicating the first ladder logic scan.
s. The processor shall provide a comprehensive instruction set including:
    (1) Relay Contact Input:
        (a) Normally open.
        (b) Normally closed.
        (c) Transitional.
    (2) Relay Coil Output:
        (a) Standard.
        (b) Retentive.
    (3) Timers:
        (a) On delay.
        (b) Off delay.
        (c) Duration.
        (d) Retentive
        (e) Time bases of 1.0 sec, 0.1 sec, and 0.01 sec.
    (4) Counters:
        (a) Count up.
        (b) Count down.
    (5) Arithmetic:
        (a) Single-precision.
        (b) Double-precision.
        (c) Integer.
        (d) Add.
        (e) Subtract.
        (f) Multiply.
        (g) Divide.
        (h) Square root.
        (i) Less than.
        (j) Greater than.
        (k) Equal.
    (6) Logical:
        (a) And.
        (b) Or.
        (c) Exclusive or.
        (d) Compare.
    (7) PID.

4. Communications Hardware:

a. The PLCs shall be capable of communicating with each operator station and with each other over a EtherNet/IP communications network.
   (1) All data within a PLC shall be accessible to any operator station or PLC.
      (a) Programming functions shall be possible over the network.
      (b) Unloading and downloading of programs shall be possible over the network.
      (c) The operating mode of the PLC shall be changeable via network.
b. Provide (dual) RJ-45 Ethernet communication ports to connect the PLCs to the Ethernet network as indicated. The communications protocol shall be EtherNet/IP.

5. PLC Input and Output Modules:
   a. AC Digital Input Modules:
      (1) Provide module 5069-IA16..
      (2) 120Vac nominal input voltage with an on-state voltage of 79 to 132Vac and an off state voltage less than 20Vac.
      (3) Shall have a maximum of 16 inputs per module.
      (4) Maximum hardware input delay time of 10 ms.
      (5) Maximum inrush current of 0.25 Amps.
      (6) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.
   b. Relay Output Modules:
      (1) Provide module 5069-OW4I.
      (2) Rated 2.5 Amps nominal at 120Vac.
      (3) Shall have a maximum of 4 individually isolated relay outputs per module.
      (4) Maximum output delay time of 10 ms.
      (5) Make rating of 15 Amps and a break rating of 1.5 Amps at 120Vac.
      (6) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.
      (7) Provide individual surge suppressors for each output to protect module from surges caused by inductive load switching.
   c. Analog Input Modules:
      (1) Provide module 5069-IF4IH.
      (2) Four individually isolated, differential type, 4-20 mA current inputs.
      (3) Each input shall have a minimum 16-bit resolution.
      (4) Shall be accurate to 0.35% full scale at 25°C (77°F).
      (5) Provide 710Vdc channel to channel isolation and channel to backplane isolation.
      (6) Programmable input filter.
      (7) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.
   d. Analog Output Modules:
      (1) Provide module 1769-OF8.
      (2) Eight, single ended type, 4-20 mA current outputs.
      (3) Each output shall have a minimum 16-bit current resolution.
      (4) Provide 710Vdc channel to channel isolation and channel to backplane isolation.
      (5) Maximum scan time of 110 ms for all channels.
      (6) Operating temperature of 0 to 60°C at 5 to 95% non-condensing relative humidity.

C. Distributed I/O:
1. Provide Allen-Bradley distributed I/O rack where indicated and specified for connection of hardwired I/O to the Ethernet network.
2. Provide 1756-EN2T EtherNet/IP communications interface module for backplane.
3. Refer to ControlLogix series section above for hardware requirements.

2.24 OPERATOR INTERFACE TERMINAL (OIT):

A. Industrial Graphic Terminals:
1. Provide for manufacturer supplied control panel OITs where indicated and specified.
2. Provide a 15" flat panel color TFT display (18-bit color, minimum).
3. Luminance shall be a minimum of 300 cd/m2 (Nits) with a field replaceable backlight.
4. Operating systems shall be Microsoft Windows CE 6.0 R3 or newer.
5. CPU shall be an x86 with 1.0 GHz clock speed minimum.
6. Display unit shall have a minimum of 512MB or DDR2-533Mhz RAM.
7. Environmental operating temperature range shall be 0 to 55°C, at 5 to 95% non-condensing relative humidity.
8. Shall be panel mounted with a NEMA rating to match the associated enclosure rating.
9. Provide the following external ports and interfaces as minimum:
   a. One SD Card (SDHC).
   b. One USB-2.0 host ports for peripheral connections.
   c. One USB device port for connection of host computer.
10. Communication interfaces shall include the following as minimum:
   (1) One RJ-45 Ethernet (10/100 Mb Autosensing).
11. Shall accept input power from 24VDC. Provide DIN-rail 120Vac AC-to-DC power supply as required.
12. Software shall include FactoryTalk ME, PDF viewer, ActiveX controls, and other software required for specific installation.
13. Shall be capable of communicating over the EtherNet/IP network as indicated.
14. Provide Allen-Bradley PanelView Plus 7 series.

B. Industrial Thin Client Terminals:
1. Provide for Plant Control System PLC cabinets and other locations indicated or specified.
2. OITs shall be industrial thin clients with panel mounted touch screens running a secure thin client node of Intouch for System Platform.
3. Provide industrial thin client hardware with a panel mount TFT-LCD (LED backlit) panel mounted touchscreen.
4. Provide industrial grade thin client terminals, optimized for ACP ThinManager.
   a. Designed to operate on an ACP ThinManager 11 or greater operating system.
5. The processor shall be a 4-core AMD Ryzen or equivalent processor rated at 2.0Ghz or greater.
6. Provide 4.0 Gigabytes (minimum) of DDR4 RAM designed to operate on a front side bus (FSB) speed of 1333 MHz (2666 MT/s) or greater.
7. Support M.2 and 2.5” HDD/SSD storage devices.
8. Minimum of one full size mPCIe socket.
9. Graphics processor shall be Radeon Vega 8 or equivalent multi-display type supporting up to four monitors. Provide resolutions up to 4096 x 2160 at 60Hz or greater.
10. External ports shall include the following as minimum:
   a. 4- DisplayPort 1.3/DP+ ports.
   b. 2- Gb LAN ports.
   c. 2- USB 3.2 Gen 2 ports.

d. 2- USB 2.0 ports.
e. 2- RS-232/422/485 COM ports.

11. Enclosure shall be aluminum or steel with fanned cooling. Operational temperature range of 0-50°C.
12. Powered from 12Vdc. Provide required power supply adapter.
13. Provide Rockwell 6200 Versaview 5200 non-display series or equal.
14. Monitor (TFT-LCD):
    a. The integral monitor shall be a 22”-inch (minimum) active matrix TFT-LCD type resistive touchscreen designed for panel mounting.
    b. Contrast Ratio of 1000:1, minimum.
    c. Brightness of 250 nits (cd/m^2), minimum.
    d. Pixel pitch of 0.28 mm, maximum.
    e. Response time of 5ms, maximum.
    f. Viewing angle (horizontal and vertical) of 160 degrees minimum.
    g. Support resolution of 1920x1080 at 60 Hz minimum.
    h. Monitor shall be NEMA 4X rated or IP equivalent.
    i. Accept DVI-I, HDMI, or DisplayPort input connection.
15. Software:
    a. Client license and ACP Thinmanager software.
    b. Provide any additional drivers or applications required software for a fully operational system.
    c. Refer to Section 40 61 96 – Process Control Software Programming and Reports for additional requirements.
16. Enclosures and Mounting Hardware:
    a. Provide the necessary stand-alone enclosures or necessary panel mounting hardware with face plates for mounting to control panels.
    b. For stand-alone installations, provide a pendant or articulating arm mounting system as required.

2.25 PLC I/O:

A. Refer to the I/O Lists at the end of Section 40 61 96 – Process Control Software Programming and Reports for a list of I/O required to be provided for the plant control system.

2.26 ELECTRICAL SYSTEM:

A. Wiring:
1. UL style 1015 (AWM), or UL style 1063 machine tool wire (MTW), 600V, 90°C.
2. No. 14 AWG (minimum), 41 strand, for all control wiring.
3. No. 18 AWG (minimum), shielded twisted pairs and triads as applicable for all instrumentation wiring.
    a. Color code shall be black/red pair (black/red/white triad) with black [or blue] PVC jacket.
4. Wire Colors (UL508A):
    a. Black: 240V or 480V AC wiring.
    b. Red: 120V AC wiring.
    c. White: AC neutral.
    d. Green: Ground.
    e. Blue: DC(+).
    f. White w/ Blue Tracer: DC(-) grounded.
    g. From alternate power source that remains energized when main disconnect is open:

(1) Yellow: Un-switched power.
(2) White w/Yellow Tracer: Un-switched neutral.

B. Wire Markers:
1. Heat shrinkable, tube-type sleeve markers, constructed of polyolefin material.
2. White sleeves with black thermal printed text.
3. Identify both ends of wire with the same unique wire number.
4. Assign wire numbers where specific designations are not indicated.
5. Markers sized for snug fit for wire size.

C. Wiring Duct:
1. Provide wide slot wiring duct in panel for routing of panel wiring. Slots shall be a minimum of 0.25-inches.
2. Provide with dual hinge, push-on cover that opens a minimum of 100 degrees to either side.
3. Wiring ducts shall be sized to accommodate all installed wire plus a minimum of 25% spare capacity.

D. Ground Bus:
1. Provide copper ground bus for power circuits.
2. Provide isolated copper ground bus for instrument shields.

2.27 ARC FLASH LABEL:

A. Provide a 6 x 4 inch (minimum), plastic arc flash label for each control panel.
B. Label shall be orange and white.
C. Label shall read as follows: WARNING – Arc Flash and Shock Hazard. Appropriate PPE and Tools Required When Working on this Equipment.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of equipment.
B. For indoor control panels final or temporary HVAC systems shall be in place and operational to maintain the ambient temperatures and humidity conditions at occupancy levels prior to energizing panel and shall be maintained for the remainder of the construction period.

3.02 PANEL FABRICATION:

A. Install all components in the panel as required and recommended by the manufacturer.
B. Provide master nameplate and nameplates for all operator interfaces. Interior nameplates shall be provided for individual component identification including, but not limited to, power supplies, PLCs, control relays, terminal blocks, Ethernet switches, circuit breakers, etc.
C. Provide interior illumination for all panels equipped with a PLC and/or network equipment.
D. Control panels supplied with 480V motor starting equipment installed shall be designed to provide physical isolation between the 480Vac components section and the control section (120Vac and below) to reduce the hazards associated with arc flash.
E. Power Distribution:
1. Provide circuit breakers for protection of equipment in the panel and distribution of power to equipment powered from the control panel. Fuses shall only be used for special protection when circuit breakers aren't suitable.
2. Provide main power disconnect operable from the exterior of the panel for all panels supplied with 480-volts. For panel supplied with 480-volt power provide properly sized control power transformer and required circuit breakers for distribution of power within

the panel. Provide dedicated circuit breakers for all 480-volt equipment powered from the panel.

1. Control panels shall include provisions for connection of a 120Vac, 20Amp supply as minimum.
    a. Control panels served by the centralized UPS system shall include provisions for connection of two (2) 120Vac, 20Amp supply circuits. One circuit shall be used as "House" power for lights, fans, receptacles, etc. The second circuit shall be derived from the centralized UPS system and serve all PLC, network, and control system related loads.
        (1) Dual 120Vac feed requirements are applicable for the following control panels:
            (a) Plant Control System PLC Cabinets.
            (b) Manufacturer supplied control panels containing PLCs and network equipment.
2. Provide 120Vac circuit breakers to distribute power within the control panel. Circuit breakers shall be sized based upon connected load. As a minimum, a dedicated circuit breaker shall be provided for the each of the following:
    a. Incoming power sources.
    b. UPS power source.
    c. Each device such as lights, fans, heaters, receptacles installed within the panel.
    d. PLC power supplies (120Vac).
    e. 24Vdc power supplies.
    f. Each 120Vac digital input or output module.
    g. Each 120Vac instrument or device powered from the panel.
3. Provide 24Vdc circuit breakers to distribute power within the control panel. Circuit breakers shall be sized based upon connected load. As a minimum, a dedicated circuit breaker shall be provided for each of the following:
    a. Output of 24Vdc power supply.
    b. PLC power supply (24Vdc).
    c. Each 24Vdc digital input or output module.
    d. Each loop powered instrument.
    e. Each analog input module, if required.
    f. Each analog output module, if required.
    g. Each 24Vdc instrument or device powered from the panel.
4. Provide signage on panel to clearly indicate that the panel is powered from multiple sources if applicable.

F. Surge Protection:
1. Provide surge protection on the incoming power supply and 120Vac distribution systems within the panel to protect electronic components from transient voltage surges.
2. Provide surge protection on all power circuits to instruments installed outside of the building envelope in which the control panel is installed. The terminal block type surge suppressor shall be the termination point for the field cabling.
3. Provide surge protection on all inputs and outputs that are connected to equipment outside of the building envelope in which the control panel is installed. The terminal block type surge suppressor shall be the termination point for the field cabling.

G. Component Mounting:
1. Operator interfaces and indicating lights shall be installed in the door of the panel at a convenient height for operator interaction.

2. Components shall be mounted to provide complete accessibility to all terminals, relay sockets, and other devices without dismantling of panel equipment.
3. Provide sufficient space around and layout components to allow for proper heat dissipation.
4. Provide sufficient space at the [top] [and] [bottom] of the panel for conduits and cable entry. Conduit entry locations shall be coordinated with the installing Contractor.

H. PLC I/O:
1. Provide interposing relays for all discrete outputs from the PLC including prepared spare points.
2. Provide interposing relays for all relay outputs from the PLC driving loads that exceed 1.5A and when indicated.
3. Wire all inputs and outputs from the PLC to terminal blocks.
4. Dry contact outputs for relay output modules and interposing relays shall be provided with surge-suppressors (snubbers) across relay coils and load field terminals as applicable to protect against transient EMI when driving inductive loads.

I. Wiring Methods:
1. Route main groups of wires in plastic nonflammable wiring duct.
2. Smaller groups of wire shall be cabled and secured with nylon cable clamps and ties or plastic spiral wraps.
3. Maintain physical separation of power, control and instrumentation cables within the panel.
4. Provide dedicated wiring ducts for management of field cables within the panel. Wiring ducts shall be sized to accommodate multi-conductor control cables. Assume a minimum of 25% spare conductors and provide a minimum of 25% spare capacity when sizing wiring ducts.

J. Terminal Blocks and Connections:
1. Provide terminal blocks for all external connections.
2. Make all connections on terminal blocks.
3. Follow manufacturer’s recommendations for terminal block installation.
4. Connect terminal blocks for instrumentation cable shields to isolated ground bus.
5. Provide required grounding type terminal blocks.

K. Spare Capacity:
1. Provide a minimum of 20 percent spare or 2 circuit breakers, whichever is greater, for each power source (Vac and Vdc) present within the panel. All spare circuit breakers shall be mounted, wired, and include provisions to terminate associated neutral or negative conductors.
2. Provide a minimum of 20 percent spare slots in each PLC chassis. Provide blank filler modules for all empty slots.
3. Provide a minimum of 20 percent or 4 points, whichever is greater, spare PLC inputs and outputs for each type in each panel. All spare points shall be wired to field terminal blocks. Fifty percent of spare analog inputs shall be configured to provide loop power.
4. Provide a minimum of 20 percent spare terminal blocks of each type mounted in the panel.
5. Provide spare DIN rail space for the installation of terminal blocks for all spare slots in the PLC chassis.

L. Provide labeling on all terminal blocks, wiring and relays to match panel drawings.

3.03 UNINTERRUPTIBLE POWER SUPPLY INSTALLATION:

A. When applicable, install UPS systems in control panel as specified.

B. Startup and initial charging shall be as required by the UPS manufacturer.
C. Install the Maintenance Bypass Switch and make the required connections to UPS and loads served.

3.04 ETHERNET SWITCH INSTALLATION:

A. Install Ethernet switches in control panels and make connections as indicated.
B. Arrange with proper clearances from other equipment and material to obtain accessibility for operation and maintenance.
C. Shall provide adequate ports for connection to the plant control system, PLC, OIT, and other included networked equipment, and provide a minimum of one spare programming port.

3.05 PLC PROGRAMMING:

A. Refer to Section 40 61 96 – Process Control Software Programming and Reports for PLC programming requirements.
B. The PLC shall be programmed to perform the required logic for proper operation of the equipment.
C. The PLC program shall be thoroughly documented with explanations in the program of the operation performed in each program line or rung.
D. The PLC shall monitor power status to the control panel. Logic shall be implemented that shall clear run contacts when power is lost and perform routine startup of equipment after a power restoration.
E. Control and status points specified to be communicated with the plant control system shall be tagged as specified and indicated and shall be organized to provide efficient communication with the plant control system.
F. Shall be programmed utilizing the latest version of RSLogix Studio 5000 programming software.
G. Soft copy of the program shall be provided to the Owner.

3.06 OIT PROGRAMMING:

A. The OIT shall be programmed to provide required operator interfaces with the equipment.
B. Shall be programmed utilizing the latest version of Windows based programming software from the manufacturer.
C. Screens shall be laid out in a logical order with a main overview screen and links from each screen back to the main overview screen. The graphic displays shall be developed using design elements and concepts intended to enhance the operator's "Situational Awareness". The development, design, and implementation of the system displays shall comply with ISA 101.01 – Human Machine Interfaces for Process Automation Systems.
D. The color scheme shall utilize a grey scale color palette for equipment and backgrounds with colors only being utilized for operator setpoints, variables, warnings, and alarm conditions.
    1. The color standards shall conform to KC Water SCADA System Software Standards and Conventions.
E. Operator adjustable set points shall be password protected.
F. A soft copy of the program shall be provided to the Owner.

3.07 INSTALLATION:

A. Control Panels:
    1. Conform to manufacturer's written instructions.
    2. Surface-mount wall mount enclosures on structural supports or wall approximately 4 feet to center line above the floor when possible.

3. Install floor mounted enclosures where indicated and bolt to floor using expansion type concrete anchors.
4. Install all necessary openings in panels.
5. Arrange with proper clearances from other equipment and material to obtain accessibility for operation and maintenance.
6. Mount plumb and level.

B. Electrical Connections:
1. Install wire and cable as specified in Division 26.
2. Conform to manufacturer's wiring diagrams.
3. Install circuits to field-mounted equipment as indicated and required.
4. Installation shall conform to NFPA 70 (NEC).

C. Place arc flash label on equipment.

3.08 FIELD QUALITY CONTROL:

A. Manufacturer's Field Services:
1. The panel supplier shall provide the field services of a trained technician for the amount of time required to commission, test and start-up all equipment provided.
2. All travel and living expenses shall be included for all trips to the site. All equipment required for testing, start-up and performance verification shall be provided by the start-up technician.

B. Check all internal and external connections and tighten as required.
C. Perform I/O checkout on all points and verify proper operation.
D. Verify proper connection of communication cabling and proper communication system configuration.
E. Field verify proper operation of all inputs and outputs.
F. Record results of I/O checkout and submit test reports as specified in Division 01.

3.09 FINISHES:

A. Control panel coatings shall be free from scratches, rust, or other defects.
B. All damaged or defective coatings shall be repaired prior to final acceptance.
C. Field Painting:
1. Touch Up:
a. Contractor shall prepare surfaces and touch up manufacturer applied coatings as required for any damage during shipment and installation.
b. Field painting shall be performed based on manufacturer's recommended procedures.
c. Contractor shall provide the necessary quantity of Manufacturer's touch-up paint to match the factory applied finish.

3.10 ADJUSTING AND CLEANING:

A. After field installation and final wiring terminations are completed the control panel wiring and cables shall be adjusted and neatly secured with tie wraps, hook-and-loop straps, or the like.
B. Wiring duct covers shall be replaced and secured as required.
C. Prior to final acceptance control panel interior and exterior shall be wiped clean and free from dust and debris.

3.11 TRAINING:

A. Provide a minimum of 4 hours of training for each panel provided at the customer's facility for operations, maintenance and service personnel.

1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, faults, diagnostic tools, troubleshooting, and preventive maintenance.
3. Hands-on training shall be provided on equipment.
4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.

B. Contractor shall record the training sessions and provide a final edited version to the Owner in electronic video file format.

C. Training shall conform to the requirements of Section 01664 – Training.

END OF SECTION 40 67 00

SECTION 40 68 00 – PROCESS CONTROL SOFTWARE

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. Contractor shall furnish a complete PlantPAx control software package including Run Time and Development for the Todd Creek WWTP. Provide all software packages and required license for the control network. The control network shall consist of the following as minimum:
   1. The plant control system software shall be based on the Rockwell PlantPAx platform.
   2. The visualization software shall be the latest version of Factory Talk View SE Distributed System.
   3. The data analysis and trending software shall be the latest version of Factory Talk Historian.
   4. HMI screens shall be developed using the latest version of the Factory Talk View Studio development package. The development software package shall be provided and installed on the server or engineering workstation designated by the Owner.
   5. Reports shall be generated as required by the Owner.
   6. One fault tolerant network server shall be provided and configured. Refer to Section 40 61 96 – Process Control Software Programming and Reports for details on the servers and software configurations.
   7. The system shall have the following minimum client nodes:
      a. Two Operator Workstation industrial thin client nodes as indicated.
      b. Five OIT Industrial Thin client nodes.
   8. All software packages shall have the latest service packs installed.
      a. Operating system service packs shall be the latest that is compatible with the current shipping version of the control system software.

1.03 RELATED REQUIREMENTS:

A. Section 40 61 96 – Process Control Software Programming and Reports.
B. Section 40 62 00 – Computer System Hardware and Ancillaries.
C. Section 40 66 00 – Process Control Networks.

1.04 REFERENCE STANDARDS:

A. Applicable Codes and Standards: Furnish software which conforms in all respects to applicable industry standards and sound engineering practice.
B. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
C. International Society of Automation (ISA).
   1. ISA 101.01 – Human Machine Interfaces for Process Automation Systems.
D. Kansas City MO Water Services.
   1. Wastewater SCADA System Software Standards and Conventions.

1.05 SUBMITTALS:

A. Submit as specified in Division 1.
B. Product Data: Submit for each type of product specified and included the following as minimum:

1. Data sheets for each software package.
2. List of all provided licenses.

C. Qualification Statements:
1. Installer's qualifications.

D. Closeout Submittals: Final documentation shall include the following as minimum:
1. Operation and Maintenance Manuals including the following:
a. Copies of all approved Product Data and licenses.
b. Software Technical Support Information.
c. Contractor Information.

E. Maintenance Material Submittals:
1. Software:
a. Original files on flash drives or SSD containing all software furnished.

1.06 QUALITY ASSURANCE:

A. All software furnished shall have an acceptable history of satisfactory use and reliability for a period of at least two years.

B. Newly released versions of the software will be considered if it has been adequately tested and proven in the market, meets the requirements of this Contract, and is approved by Engineer and Owner. Such software shall be noted in the proposal for review.

C. Installer Qualifications:
1. Prior to installation and development, submit data of installer's experience and qualifications.
2. Installers shall have experience with the provided software which shall include 5 years on projects of similar complexity.
3. Include installers specific experience history in installing and developing with the specified software for projects of similar design.
4. Include names and locations of two projects successfully completed using the specified software platform.
5. Include written certification from users that systems have performed satisfactorily for not less than 18 months.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Control, Historian and Data Analysis Software:
1. Rockwell Automation, Inc.

B. Design and Programming Software:
1. RSLogix 5000, Rockwell Automation, Inc.
2. RSLinx, Rockwell Automation, Inc.

C. Thin Client Management Software:
1. Automation Control products (ACP).

2.02 GENERAL:

A. Contractor shall provide all software and application specific firmware as required to provide a control system which meets the functional requirements of this Part.

B. The control software shall be a full function process monitoring and control package. It shall be capable of simultaneously performing all of its functions in a multi-tasking environment.

C. The control software shall provide at least the following capabilities as an integrated function:
1. Input/output functions.

2. Modulating controls.
3. Digital controls.
4. Data processing and communications.
5. Alarm functions.
6. Sequence of events.
7. Log functions.
8. Operator display functions.
9. Printing functions.
10. Operator console functions.
11. Programming functions.
12. Historical data storage.
13. Historical and real-time trending functions.
14. Support thin client remote desktop services.

D. The control software shall provide a mechanism to generate data to files with a standard format. These data files shall be accessible to other programs such as spreadsheets and database managers and shall be used to generate reports and perform data analysis outside of the control program itself.

E. The development, design, and implementation of the control system software shall comply with ISA 101.01 – Human Machine Interfaces for Process Automation Systems and Owner standards.

2.03 SOFTWARE AND LICENSES:

A. As a minimum the following software and licenses shall be provide. If additional software or licenses are required for a fully operational system, they shall be provided.
1. FactoryTalk View Site Edition Server Unlimited Display.
   a. Provide required licenses to allow for instant failover from primary server to the secondary server as specified.
   b. Provide necessary licenses for 10 thin client connections.
2. FactoryTalk Historian Site Edition Server – 2,500 Rockwell Data Points.
   a. Provide necessary licenses for 10 concurrent client sessions.
3. FactoryTalk View Site Edition Client.
   a. Provide as required for the indicated and specified clients.
4. FactoryTalk View Machine Edition (ME).
   a. Provide licenses required for the specified stand-alone OITs:
5. ACP Thinmanager and RDS, 10 client licenses (typical for each server).
   a. Provide for the Primary and Secondary Servers as required for a failover configuration.
6. RSLogix Studio 5000 Professional Edition.
   a. Includes RSLinx and RSNetworx for EtherNet/IP.
   b. Provide and install on the specified engineering server virtual machine unless otherwise designated by the Owner.
7. Refer to Section 40 61 96 – Process Control Software Programming and Reports for details on the virtual machines and software configurations.
8. All software versions shall be coordinated with the Owner's current SCADA standards.
9. Provide a minimum of 2 years of Rockwell Automation technical support for the control system software from date of software purchase. Includes software upgrades through the maintenance period.

10. Provide a minimum of 2 years of manufacturer's software maintenance and support for all third-party applications. Includes free software upgrades and technical support through the maintenance period.

2.04 COMMUNICATIONS AND PREPROCESSING:

A. General: The communications and preprocessing portion of the control software shall perform the following functions:
   1. Communicate with the PLC's located on the plant control system Ethernet network.
   2. Support mutual data exchange between each operator station and PLCs on network.
   3. Support multiple communications networks and protocols concurrently.
   4. Validate, convert, process and alarm check all data received by any of the communications interfaces according to the criteria selected for each data point.
   5. Scans shall be performed continuously on all communications channels. Scans shall be sequential for those devices on the same communications network and the different communications networks shall be scanned in parallel.
   6. Periodic scan rates at different priorities shall be definable on an individual point basis or by groups of points. The scan rates shall be definable.
   7. Unsolicited messages shall be accepted and processed when sent over any of the communication networks.
   8. Processing by exception will be allowed provided the deadband is operator assignable on a point basis. The deadband will be used to inhibit preprocessing of data which has not changed by more than the preset deadband from the previous scan. The deadband shall be assignable in engineering units or as a percentage of the scale range. An entry of zero (0) shall be acceptable for the deadband.
   9. If the preprocessing functions have not been completed for certain data before new data for the same points is received in the next scan, appropriate diagnostic messages shall be directed to output devices, operator screen, printer, audible alarm, and related items, selected during system configuration.
   10. Communications throughput shall be limited solely by the communications networks and not by the control software/hardware provided in this Section.
   11. Provide the means to control the plant equipment or to initiate start and stop sequences from any operator station. From the operator station the operator shall have complete control of the PLC's.
   12. Update displays for all points at least once every 50 milliseconds. The system shall update its own data base simultaneously. Screen call-up time for any graphic shall not exceed 3 seconds for static and dynamic data.

B. PLC Communications:
   1. The control software shall include the communications interface from the application server to the PLC network.
   2. Multiple scans per PLC at different priority scan rates shall be supported.
   3. The software shall perform any and all translations of PLC communication messages that may be required to transfer/receive data between the real-time database and the communications protocol.
   4. The communications interface shall provide all necessary error-checking and retransmission capabilities to ensure no data transmission errors.

C. Data Preprocessing:
   1. Analog Inputs:
      a. The system shall perform calculations required in the handling of analog input data including but not limited to averaging, time integrations, ranging, summations on flow measurements, and square root extractions.
      b. All analog input points shall be checked against high and/or low process limits. An analog input outside these limits shall be considered in alarm.
      c. All analog input points shall have re-alarm capabilities. Once a point is in alarm, it will re-alarm if its value continues to increase or decrease beyond the re-alarm limit assigned to that point. Re-alarm limits shall be specified in percent of input range.
      d. All analog input points shall have the capability of being assigned high and low alarm dead bands. Alarm dead bands represent the value that an input point must decrease or increase above or below an alarm set point before it activates a high or a low alarm.
      e. It shall be possible to automatically inhibit the alarming of any analog input or composed point (either analog or digital) by the state of one or more contact closure input, digital logic output, or the values of analog variables in order to eliminate nuisance alarms (e.g. low temperatures alarms disabled during start-up). The inhibiting contact closure or analog value could be different for each analog or composed point if required. When inhibiting, no alarm indication will be given to the operator and it will not be shown on alarm groups. Upon restoration of alarm functions, the point will be scanned for alarming and, if in alarm, the normal operator indication shall occur.
      f. All inhibited alarms shall be automatically logged. A summary of inhibited alarms shall be provided.
      g. Provisions shall be made to avoid erroneous alarms on rate of change alarms when scanning of a point first resumes.
      h. A method of differentiating between high or low alarms and "BAD" (alarms outside reasonable limits for a point) alarms should be used so that types of alarms are easily identifiable.
   2. Analog Composed Points:
      a. Analog composed points are defined as points resulting from calculations involving two or more analog points. The results of these calculations shall be assigned point numbers and shall be capable of being alarmed, displayed, trended, or logged.
      b. Each subsystem shall have the capacity to process analog composed points. This number is in addition to any composed points per subsystem required by the system for logs. It is also in addition to any integrations, averages, weighted averages, and necessary calculations of input points.
      c. Analog composed point capabilities shall be the same as specified for analog inputs.

2.05 ALARM FUNCTIONS:

A. General:
   1. The system shall compare all analog input points, composed points, etc., against high and/or low alarm limits. If an input is determined to be beyond either of these limits or if a contact input designated as an alarm is determined to be in alarm, the system shall record a time-tagged alarm message to the alarm database. Simultaneously, a similar alarm message will be displayed on the operator workstation screen.
   2. Once an analog point is in alarm, it shall re-alarm if its values continue to increase or decrease beyond the re-alarm limit.

3. All alarms shall have an assignable time delay to prevent an alarm message from being printed or displayed until the alarm has been present for the duration of the time delay.

B. Alarm Priorities/Levels:
1. The system shall have the capabilities to assign different priorities to points in alarm. There shall be at least four levels of alarm priorities for combinations of display, print out, or audible.
2. All points shall have the capability of pre-assignment to one of four levels for the operator screen display color to identify the alarm criticality.

C. Alarm sequence shall be as follows:
1. Alarm Occurs (Priority 1): Event recorded to alarm log and the operator screen displays alarm with a similar message in flashing magenta.
2. Alarm Acknowledgement (Priority 1): Operator onscreen alarm display remains magenta but stops flashing and alarm acknowledgement recorded to alarm log.
3. Return to Normal (Priority 1): Alarm display changes to a lighter shade of magenta. Alarm display clears when the point has been acknowledged. A return to normal is recorded in the alarm log.
4. Re-alarms: Re-alarms are treated like new alarms.
5. Alarm Priorities (1 through 4): Additional priority alarm assignments shall be treated in similar fashion but with alternate color assignments. Color assignments for priority levels shall be as defined below:
   a. Priority 1 (Low): Magenta.
   b. Priority 2 (Medium): Yellow.
   c. Priority 3 (High): Orange.
   d. Priority 4 (Urgent): Red.
6. Additional alarm management and classifications: Alarms shall be capable of being suppressed, inhibited, and shelved. In these cases, color assignments shall uniquely identify the alarm status and current alarm classification.
7. Coordinate alarm sequence and priorities with Owner's standard conventions.

D. One common alarm acknowledgement scheme shall be used for all alarms on the operator screens so that only one action is required by the operator to acknowledge.

2.06 OPERATOR DISPLAY FUNCTIONS:

A. General:
1. All standard displays shall be accessible from any operator workstation on the Ethernet network. Displays shall be in high resolution color graphics.
2. The system shall have full flexibility in specifying or changing tags, tag descriptions, ranges, scale factors, or grouping the various displays.
3. All graphic displays should be built interactively using the supplied control system software library and graphics development program with the maximum flexibility for ease of graphics building or revision.
4. Displays shall allow windowing for additional graphics and faceplates.
5. The operator shall be able to use a variety of input devices to interact with the control software including keyboard, mouse, touchscreen, etc.

B. Trend Displays:
1. The system shall have the capability to trend single variables or groups of variables simultaneously on the operator screens.
2. The system shall allow the operator to define a minimum of 50 group trend displays.
3. Any analog or composed point may be assigned by the operator to the trend display.

4. Trend display for each point shall include the point description, time base, and ordinate magnitude.
5. The trend time base shall be assignable.
6. Trending of historical information shall be available. The operator shall be able to scroll backward or forward through data.

C. Custom Graphic Displays:
1. The system shall have capabilities to easily design and display custom displays. These displays may take the form of icon objects, plant schematics, bar graphs, and tabular data.
2. The custom displays shall be fully interactive displays providing full process monitoring and manipulation. This interaction shall allow for the changing of set point, output, mode, ratio, bias, and function for modulating parameters. The interaction shall also allow for issuance of start/stop and open/close commands for loops.
3. The system shall have a standard group of objects and symbols from which can be made and stored in a symbol library. Manufacturer standard symbols and objects shall also be provided in the library.
4. Pixel manipulation of shapes and creation of symbols and graphics for library storage shall be available.

D. Alarm Displays:
1. Alarm Summary Display:
   a. The alarm summary display shall differentiate between the priority levels of alarm.
   b. The highest priority alarm summary shall list all primary alarms as well as points exceeding re-alarm limits. These alarms shall be listed in the sequence they were detected with the newest alarm at the top of the page.
   c. The other alarm summaries shall be displayed below the primary alarms. These alarms shall also be listed in order of detection.
   d. A point in alarm shall flash on either alarm summary display until acknowledged from the keyboard or pointing device.
   e. Messages for alarms, displayed on the screens, shall include the following information:
      (1) Point tag (ID).
      (2) Point description.
      (3) Value or status.
      (4) Engineering units (if applicable).
      (5) Limit exceeded (if applicable).
   f. Alarms should be available for historical retrieval for operator information. The operator shall be able to shift pages or scroll through the alarm history for alarm review.
2. Alarm Group Display:
   a. Alarm groups shall be able to be displayed on any operator workstation. Each alarm group shall represent those alarm points associated with a specific piece of equipment, operating unit, or portion of the plant.
   b. The point ID of a point in alarm shall flash on the alarm group display, until it is acknowledged from the keyboard or pointing device. The size of each alarm group shall be selectable.
   c. Any alarm group shall be capable of being disabled in its entirety or individual alarms shall be capable of being disabled selectively.
3. Alarm Diagnostics: The alarm diagnostic function shall be available to the Operator for programming specific recommended actions to the acting operator when certain alarms

occur. The recommendations shall appear on the operator workstation screen in response to certain alarm conditions as an aid in operator response.

E. Point Summary Displays:
   1. It shall be possible for the operator to display summaries listed below.
   2. Display of a point summary shall include at least the following:
      a. Time.
      b. Summary heading.
      c. Point ID and description for each point in the summary.
      d. Pertinent data for each point in the summary, such as value, alarm status, alarm limits, etc.
      e. Point summaries available for operator print or display shall include at least the following:
         (1) Analog input points.
         (2) Composed points.
         (3) Contact input points.
         (4) Alarm summary.
         (5) Inputs deleted from scan.
         (6) Inserted value summary.
         (7) Bad inputs summary.
         (8) High/low reasonable limit summary.
         (9) Sequence of events logs.
   3. It shall be possible for the operator to cancel a running summary at any time.
   4. Summaries shall be displayed on any of the operator screens.

2.07 PRINTING FUNCTIONS:

A. The following defines the minimum printing functions and printing formats that shall be available on the printer(s).

B. Single Point Print:
   1. Printout of a single input point shall include at least the following:
      a. Time.
      b. Point tag (ID).
      c. Point description.
      d. Value or status.
      e. Engineering units (if applicable).
   2. It shall be possible for the operator to trend a single point on the printer. Trend interval shall be adjustable by operator.

C. Alarm Printout:
   1. The operator shall be able to print an alarm list at any time. The operator shall be able to define the number of alarm points to print.

D. Operator Screen Printout: Any display on any of the operator screens for a unit shall be able to be printed out as required to provide a hard-copy record.

E. Trend Printout:
   1. It shall be possible to print trend charts as displayed on the operator workstation.

2.08 PROGRAMMING FUNCTIONS:

A. The system shall permit the plant personnel to perform programming functions listed below. It shall be possible to perform these functions with the system on-line. All programming functions shall be under password protection.

B. All operations required to implement these changes shall be accomplished in a conversational mode via the operator screens and keyboards.
C. Programming functions shall include at least the following:
   1. Add and define new input points up to the system capacity.
   2. Modify point definition.
   3. Delete input points.
   4. Add or delete points for any group log, except for those group logs reserved for operator definition.
   5. Add or delete points to any periodic log. Change headings of period logs.
   6. Construct new graphic displays or modify existing ones.
   7. Prepare special summaries.
   8. Have the capability to add new logic programs or modify existing system logic programs with the system on-line.
   9. Modify or add performance calculations as required.
   10. Modify or add reports as required.
D. Software Maintenance:
   1. All programs required to enable the programmer to perform software maintenance functions shall be provided.
   2. These shall include program routines to permit dumping of memory, loading of memory, memory print, and related operations.
E. The control software shall include an integral interface supporting access to all real-time database entries.
   1. All database entries shall be accessible for reading, modifying and updating. Calculated results shall be capable of being stored directly onto the database.
   2. The control software shall process all data modified or stored in the database by the user programs in the same manner as all other database entries.
F. The control software shall include an integral interface allowing direct real-time access to all database items by Microsoft EXCEL and the specified historian and reporting applications.

2.09 HISTORICAL DATA STORAGE:

A. Contractor shall furnish a fully operational FactoryTalk Historian package.
B. The system shall store information taken at pre-defined intervals for at least 2500 of any operator selected variables.
C. The system shall utilize a Microsoft SQL database.
D. Access to all historical data storage functions shall be through a user-friendly, interactive menu driven type client interface.
E. All data in the real-time database shall be accessible for historical data storage.
F. All historic data required for display and report generation shall be saved on-line for a period specified by operator.
G. The amount of data stored on-line shall be limited only by the amount of available disk space.
H. Any point may be added or deleted from historical data storing at any time, on-line or off-line, without disrupting the historical data storage function.
I. Sampling of historical data storage points shall be enabled or disabled without requiring addition or deletion of these points and without disrupting the historical data storage function.
J. Provide the password protected capability to edit any data stored by the historical data storage function on-line.
K. Provide an on-line library-type interface for tracking points assigned to historical data storage.
L. The system shall include an alarm/operator action log. The log shall consist of any assigned alarms and operator actions.

M. All data shall be automatically stored and retrieved from hard disk drives in the operator stations.
N. No data shall be lost during a power interruption and no special manual boot-up procedure shall be required by the operator or technician.
O. The system shall provide an adjustable operator alarm whenever the drive capacity exceeds 80% of maximum capacity.
P. All data files shall be manually or automatically (operator selectable) archived. Archived data files shall be retrievable and the system shall have an integrated function capable of displaying retrieved archived data.
Q. Provide an on-line library-type interface for tracking archival media.

2.10 DATA QUALITY:

A. Every database entry, including but not limited to scanned data from the PLC, both discrete and analog, calculated data and data received over networks, shall include indicators for data quality. The data quality indicator shall be updated every time communications with the associated device are attempted or successfully complete. The data quality indicators shall include, but not be limited to:
   1. Old/Bad Data - The point was not able to be scanned when attempted.
   2. Off Scan - The data for this point is not being updated. This indicator may be set as a result of operator request. Only an operator request can place this point back on scan.
   3. Operator Inserted Valve - this indicator is set by the greater on reset when the data is updated by scanned data.
B. A calculated point will have the old/bad data quality if any of its inputs have the old/bad or off scan quality and are not manually entered.
C. Operator entered values are considered good data.
D. Operator entered and off scan, indicators may be set and reset on calculated points by operator action and are independent of the indicators on the calculations input points.

2.11 SECURITY:

A. The control software shall provide a fully integrated password protection scheme by restricting access to system features, functions, and database points. The password protection scheme shall consist of multiple levels of access one of which shall be full access.
B. The ability to assign and modify the access levels shall be restricted to the full access level.
C. The system shall allow assignment of multiple passwords to each access level.
D. The assignment of functions to the various access levels shall be user configurable and restricted to the full access level.

2.12 UTILITY AND SUPPLEMENTAL PROGRAMS:

A. Backup and Recovery Software:
   1. Provide backup and recovery software package as required to perform routine scheduled backups of the plant control system servers.
   2. Shall be compatible with the operating systems supplied.
   3. Synology DiskStation Manager or approved equal. Coordinate with the supplied NAS equipment specified in Section 40 62 00 – Computer System Hardware and Ancillaries.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Sever Based Control Software:
   1. Install all the software and configure system for proper operation.
   2. Configure system for automatic failover as specified.
   3. Provide "staging," checkout, training, and start-up as specified and indicated.

B. Client Software:
   1. Install all the software and configure system for proper operation.
   2. Configure client software for automatic failover as specified.
   3. Configure system to automatically logoff workstations installed after 30 minutes of inactivity. Time period shall be adjustable by the Owner.
   4. Provide "staging," checkout, training, and start-up as specified and indicated.

C. Utility and Supplemental Software:
   1. Install all the software and configure system for proper operation.

3.02 CUSTOMIZED PROGRAMMING AND SCREEN DEVELOPMENT:

A. Refer to Section 40 61 96 – Process Control Software Programming and Reports for customized programming and screen development requirements.

3.03 TRAINING:

A. Refer to Section 40 61 96 – Process Control Software Programming and Reports for training requirements.

B. Training shall conform to the requirements of Section 01664 – Training.

END OF SECTION 40 68 00

SECTION 40 70 00 – INSTRUMENTATION FOR PROCESS SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes the requirements for measuring and controlling instruments.

1.03 RELATED REQUIREMENTS:

A. Section 40 67 00 – Process Control Panels and Hardware.

1.04 REFERENCE STANDARDS:

A. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.

B. American Society of Mechanical Engineers (ASME):
   1. ASME B16.5 – Pipe Flanges and Flanged Fittings.

C. International Society of Automation (ISA).
   1. ISA S20 – Specification Forms for Process Measurement and Control Instruments, Primary Elements and Control Valves.

D. National Electrical Manufacturers Association (NEMA).

1.05 SUBMITTALS:

A. Submit as specified in Division 1.

B. Manufacturer with prime responsibility shall assume responsibility for all Compliance Submittals.

C. Product Data: Submit for each type of product specified and included the following as minimum:
   1. Individual specifications and technical data for instruments and similar major system components to conform to ISA S20.
   2. Electrical and mechanical connection diagrams for all instruments.
   3. Physical dimensions for each instrument.

D. Special Procedure Submittals:
   1. Test Plan:
      a. Provide a complete and detailed calibration and test plan for the supplied instrumentation.
      b. Include procedures for certification, validation, and testing.
   2. Syllabus for Owner training.

E. Test and Evaluation Reports:
   1. Factory test and calibration reports.
   2. Field test and calibration reports.

F. Closeout Submittals: Final documentation shall include the following as minimum:
   1. Operation and Maintenance Manuals including the following:
      a. Operation and maintenance manuals for all instruments furnished.
      b. Copies of all approved Product Data.
      c. Copies of all approved Test and Calibration Reports.
      d. Spare parts and supply list.
      e. Warranty Information.
      f. Contractor Information.

g. Training Materials. Includes final edited training videos.

G. Maintenance Material Submittals:
1. Spare Parts:
a. Provide five (5) spare fuses of each type used.
b. Provide any cabling and serial to USB converters necessary to setup and calibrate supplied instrumentation from a laptop computer.
2. Software:
a. Manufacturer supplied software required for setup and calibration of instrumentation shall be provided.

1.06 QUALITY ASSURANCE:
A. Factory Tests:
1. As a minimum, the manufacturer's standard tests and calibration procedures shall be conducted on all instruments.

1.07 DELIVERY, STORAGE, AND HANDLING:
A. Instrumentation and associated equipment shall be packaged and shipped to the project site to avoid damage.
B. All instrumentation shall be stored according to the manufacturer’s instructions.

1.08 WARRANTY:
A. Instruments shall be provided with a minimum 1-year manufacturer’s warranty.
B. In the event a component or instrument fails to perform as specified or is proven defective during the warranty period, the manufacturer shall promptly repair or replace the defective part at no cost to the Owner.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:
A. Radar Level Transmitters:
1. Endress+Hauser, Inc.
2. Magnetrol International, Inc.
3. Rosemount, Emerson Electric Co.
4. Vega.
B. Laser Level Transmitters:
1. ABB.
C. Ultrasonic Flow and Level Transmitters:
1. Rosemount, Emerson Electric Co.
2. Siemens.
3. Magnetrol International, Inc.
D. Float Switches:
1. Anchor Scientific, Inc.
2. Contegra.
3. Flygt.
4. Magnetrol.
E. Point Level Switches:
1. Warrick, GEMS.
2. Engineer Approved Equal.

F. Leak Level Switch:
   1. Flowline, Inc.
G. Magnetic Flow Meters – Inline Type:
   1. ABB.
   2. Endress+Hauser, Inc.
   3. Foxboro, Schneider Electric.
   4. Rosemount, Emerson Electric Co.
H. Thermal Mass Flow Meters:
   1. ABB Inc.
   2. Endress & Hauser.
   3. Magnetrol.
I. Rotameters:
   1. ABB.
   2. Brooks Instrument.
   3. Krohne.
   4. Engineer approved equal.
J. Dissolved Oxygen Analyzers:
   1. Hach Company.
K. pH, ORP, and Conductivity Equipment:
   1. Hach Company.
L. Phosphate Analyzer Equipment:
   1. Hach Company.
M. UVT Analyzers:
   1. Hach Company.
N. Gas Detection Equipment:
   1. Rosemount, Emerson.
   2. MSA.
O. Ozone Detection Equipment:
   1. Teledyne.
   2. BMT.
   3. Engineer-approved Equal.
P. Pressure Transmitters:
   1. ABB.
   2. Foxboro, Schneider Electric.
   3. Rosemount, Emerson Electric Co.
Q. Pressure Switches:
   1. Allen-Bradley, Rockwell Automation, Inc
   2. Ashcroft, Inc.
   3. Barksdale, Inc.
   4. Dwyer Instruments, Inc.
   5. SOR, Inc.
R. Pressure Gauges:
   1. Ashcroft.
   2. McDaniel, Inc.
   3. Engineer-approved equal.
S. Temperature Transmitters:
   1. ABB.
   2. Endress+Hauser, Inc.
   3. Foxboro, Schneider Electric.

4. Rosemount, Emerson Electric Co.
5. Siemens.

T. Temperature Switches:
1. Ashcroft, Inc.
2. Barksdale, Inc.
3. United Electric Controls.

U. Limit Switches:
1. ABB.
2. Allen-Bradley, Rockwell Automation, Inc.
3. Honeywell International, Inc.
4. Square D, Schneider Electric.

V. Flow Switches:
1. B/W Controls, Ametek, Inc.
2. Dwyer Instruments, Inc.
3. Fluid Components, Inc.
4. Magnetrol International, Inc.
5. McDonnell & Miller.

W. Solenoid Valves:
1. ASCO Valve, Inc.
2. DeZURIK.

X. Indicators:
1. Precision Digital Corporation.
2. Red Lion Controls, Inc.

Y. Audible and Visual Devices:
1. Edwards Signaling, United Technologies Corporation.
2. Federal Signal Corporation.

2.02 INSTRUMENTS:

A. Refer to the instrument list at the end of this Section for a list of instruments specified to be provided by this Division.

B. Refer to Division 46 for instruments to be provided with packaged equipment.

2.03 GENERAL:

A. Transmitters shall have an output signal of 4 to 20 mA dc into a minimum load range of 0-600 ohms at 24Vdc.

B. All analog indicating and recording receivers shall have evenly graduated scales.

C. Provide all mounting brackets, pipe stands, and accessories required to install all field mounted instruments. All mounting brackets and hardware for instruments installed in exterior locations or within process areas shall be stainless steel. Wall-mounted brackets for level sensors shall be slotted at end for sensor removal.

D. Furnish and install all accessories required for complete and working systems as specified and indicated.

E. Provide sun shades for all exterior mounted transmitters.

F. All flanged instruments shall comply with ASME B16.5.

G. All instruments or instrument wetted parts contacting the process stream directly shall comply with NSF 61 for contact with potable water.

2.04 RADAR LEVEL TRANSMITTERS:

A. Provide loop powered radar level transmitter for continuous level detection of liquids.

B. Provide 316 stainless steel, PTFE encapsulated, or equivalent antenna. Minimum horn size of 2-inch. Antenna extensions of 8-inch and greater shall be provided as required for the indicated application and mounting style.
   1. Maximum beam angle of 8 degrees for liquid applications, unless otherwise specified.
   2. Radar level transmitters for the Coarse Screening System and Influent Pump Station Wet Well shall have a maximum beam angle of 3 degrees or be laser level transmitter type.
   3. The cone shall be sealed from the process environment.

C. Process connection of 6-inch 150lb flange unless required or indicated otherwise.

D. NEMA 4X aluminum housing with LCD display.

E. Provide 4-20mA analog signal proportional to level.

F. System accuracy shall be within ±0.25-inch.

G. Unit shall be capable of mapping out unwanted obstructions via user friendly interface software. Provide required software and cable to connect to the unit.

H. Provide waveguide extension for proper mounting when required for the indicated application.

I. Provide sunshield for outdoor mounted units.

J. Provide a stainless-steel mounting bracket for units indicated to be wall mounted.

2.05 LASER LEVEL TRANSMITTERS:

A. Provide loop powered laser level transmitter in lieu of radar level transmitter where maximum beam angle of 3 degrees is not possible.

B. Shall use an eye safe laser beam for measurement. Maximum beam angle of 0.5 degrees.

C. Measurement range shall be 2 – 100 feet for liquids and 2 – 330 feet for solids

D. Mounting:
   1. Process connection shall be a 2-inch 150lb stainless-steel flange unless required otherwise.
   2. Provide stainless steel mounting bracket for units when indicated to be wall mounted.

E. NEMA 4 aluminum housing with LCD display.
   1. Provide Intrinsically Safe, Class 1, Division 1 rated housing for units installed within classified hazardous areas.

F. Provide 4-20mA analog signal proportional to level.
   1. Provide with HART communication capability. Provide device type manager (DTM) software module for use in HART device setup and monitoring software if required.

G. System resolution shall be within ±0.2-inch. System accuracy shall be within ±0.4-inch.

H. Provide sunshield for outdoor mounted units.

I. Provide screwed-on stainless steel nameplate with instrument tag number as identified on Contract Documents.

J. Provide ABB LLT100 series or Engineer-approved equal.

2.06 ULTRASONIC LEVEL AND FLOW TRANSMITTERS:

A. System shall consist of an ultrasonic transponder and a separately mounted transceiver and transmitter to measure level or flow in the locations specified and indicated.

B. System accuracy shall be within ±0.5% of calibrated span.

C. Transducer:
   1. Shall be completely encapsulated in a PVDF housing.
   2. Process connection of 2-inch NPT unless required otherwise. Provide with threaded connection and bracket hardware as required for the indicated mounting.
   3. Provide a temperature sensor at the transducer housing to sense ambient temperature.
   4. Transducer range shall be as specified.

5. Provide the cable to connect the transducer to the transmitter. Coordinate length with installing Contractor.
6. Provide a sun shield over transducers exposed to direct sunlight.
7. Shall be rated for installation in a Class 1, Division 1 or 2, Group D hazardous environments when installed within classified areas.

D. Transceiver and Transmitter:
1. Microprocessor based digital design.
2. Provide temperature compensation to correct for speed variations of the ultrasonic signal due to air temperature changes.
3. Field calibration of zero and span shall be accomplished by keypad or wireless remote.
4. Provide a linear 4-20mA output signal proportional to level or flow of liquid as applicable.
5. Shall have an integral display.
6. Enclosure shall be rated NEMA 4X.
7. Shall have the capability to map out obstructions in the beam path.
8. Shall operate from 120Vac, 60-hertz.
9. Enclosures installed outdoors shall have a thermostatically controlled strip heater to prevent condensation.

2.07 FLOAT SWITCHES:

A. Rigid float switch constructed of 316 stainless steel, PVC, polypropylene, or equivalent materials.
B. One N.O. contact rated 1.0 Amps, 120Vac minimum.
C. Furnished with necessary length of cable and weight kit for cable suspension.
D. Float switches shall be mercury free.
E. Provide intrinsically safe barrier relay for hazardous locations. Intrinsically safe barriers shall be as specified in Section 40 67 00 – Process Control Panels and Hardware.

2.08 POINT LEVEL SWITCH:

A. Provide conductivity type level switches for liquid or solids level detection.
B. Provide additional reference probe.
C. Wetted parts shall be 316 stainless-steel.
D. Probe electrode shall be housed in plastic shielding.
E. Probe shall be designed to be suspended in liquid with PVC-insulated wires.
F. Provide length of cable as required for installation.
G. Process connection shall be as required.
H. Provide necessary adapter kits and fittings. Materials for adapter kits and fittings shall be 316 stainless steel, PVC, or Teflon.
I. NEMA 4X housing.
J. Powered from 120Vac.
K. Provide intrinsically safe barrier control relay for use in hazardous locations. Intrinsically safe barriers shall be as specified in Section 40 67 00 – Process Control Panels and Hardware.
1. Relay shall provide 1 N.O. and 1 N.C. output contact rated 0.5Amps at 120Vac.
2. Relay sensitivity shall be field adjustable and provide for a minimum of 200 feet of wire from relay to probe.

2.09 LEAK LEVEL SWITCH:

A. Optical leak detection level switch.
B. NEMA 6 polypropylene housing with 3/4-inch NPT mounting thread.

C. When the switch is mounted 1/8-inch above finished floor, the sensor shall be able to detect a liquid level at or below 3/8-inch above floor.
D. Minimum accuracy to ± 1/16 inch.
E. Shall operate from 24Vdc.
F. Provide normally open relay contact that closes when liquid is detected. Contact shall be rated a minimum of 1 Amp at 24Vdc.
G. Provide with a minimum of 10-foot of cable. Provide additional length when required to interface designated termination junction box.

2.10 MAGNETIC FLOW METERS- INLINE TYPE:

A. The flow meter system shall consist of a flow element and an indicating transmitter remotely or integrally mounted to the meter tube assembly.
B. System shall be accurate to within ±0.5% of flow rate for velocities between 3 and 30 feet per second and shall measure flow in either direction.
C. Meter Body:
    1. Stainless steel tube with carbon steel flanges.
    2. Flanges shall be type ASME Class 150 below 24-inch and AWWA Class D above 24-inch.
    3. Electrodes shall be 316 stainless steel or Hastelloy/C22 unless indicated otherwise. Provide Hastelloy/C22 electrodes for chemical feed applications.
    4. Liner shall be hard rubber or equivalent.
    5. Sizes as specified in this Section.
    6. Shall be rated IP68 for continuous submergence when installed in below grade vaults. Provide “potted” cabling with adequate length of cable between the flow tube and the remote mounted transmitter.
    7. When installed within classified areas, the meter and transmitter shall be rated for installation in Class 1, Division 2, Group D Hazardous Environment.
D. Transmitter:
    1. Magnetic flow meter shall have "DC" excited coils.
    2. The transmitter electronics shall be microprocessor based.
    3. Shall accept the millivolt input from the meter and provide a 4-20mA linear output signal proportional to flow.
    4. LCD display and keypad.
    5. Provided with empty pipe detection that will automatically detect an empty pipe and zero the flow display and output signal.
    6. Remote Mount:
        a. Provide wall mounted transmitter as indicated.
        b. NEMA 4X polycarbonate enclosure.
        c. Shall operate from 120Vac, 60 hertz.
    7. Integral Mount:
        a. Provide integral mounted transmitter as indicated.
        b. NEMA 4X or NEMA 6 coated aluminum enclosure.
        c. Shall operate from 120Vac.
    8. Flow meter shall be capable of measuring forward and reverse flow. Provide an output dry contact to indicate flow direction. Contact shall close when reverse flow is detected. Dry contact shall be rated a minimum of 1 Amp at 24Vdc.

E. Accessories:
   1. Cabling between transmitter and meter body shall be provided by the meter manufacturer. When not available, cabling shall be provided and installed to meet the manufacturer's requirements.
   2. Provide length of cable as required for installation.
   3. Provide a stainless-steel grounding ring on the inlet and outlet.

2.11 THERMAL MASS FLOWMETERS:

A. Insertion style or flanged in-line thermal mass flowmeters shall be provided for gas flow monitoring as specified.
B. Flow element shall be 316L stainless steel and suitable for measurement of process air.
C. Process connection shall be 1″ NPT or flanged where required for small diameter piping. Connection type shall be as recommended by the manufacturer or equipment supplier for each application.
D. Minimum turn down ratio of 20:1 or as required to meet requirements of full operating range.
E. Minimum accuracy of ±1% of reading, ±0.5% of full scale and repeatability of ±0.5% of reading.
F. Transmitter:
   1. Integral mounted transmitter shall include LCD readout display and required interface for programming and instrument setup.
   2. Shall include a minimum of one 4-20mA outputs proportional to flow.
   3. Enclosure shall be NEMA 4X rated, coated aluminum or stainless steel.
   4. Powered from 120Vac.
G. Each meter shall be factory calibrated and provided with a certificate of calibration.
H. Unit shall be programmed using project-specific application data.
I. Provide sunshield for outdoor mounted units.

2.12 ROTAMETERS:

A. General performance rotameters shall be provided as indicated and specified for each application.
B. Materials:
   1. Tube/Body: Acrylic plastic.
   2. Float: Glass or 316 stainless-steel.
   3. End fittings: 316 stainless-steel.
C. Design and Fabrication:
   1. Integral needle valve.
   2. Direct reading scale.
   3. Clean-out plugs.
   4. Accuracy: ±10%.
D. Design pressure: 100 psi.
E. Flow range shall be selected as required for each application.

2.13 ANALYTICAL INSTRUMENTATION:

A. Dissolved Oxygen Analyzers:
   1. The system shall consist of a sensing probe and analyzer/transmitter.
   2. Sensing Probe:
      a. The sensing probe shall be a continuous-reading probe utilizing luminescent sensor technology.

b. The probe shall be constructed of foamed Noryl or equal, and 316 stainless-steel. All parts of the probe shall be corrosion-resistant and fully immersible.
c. The measurement range shall be 0.00 to 20.00 mg/L (or ppm) dissolved oxygen and be accurate with ± 0.2ppm of span.
d. The probe shall be rated for 0 to 50°C operation.
e. The probe shall have an integral sensor cable with a continuous length of cable for connection to the transmitter at location indicated. The cable shall be terminated with a quick-disconnect plug.
f. The sensing probe shall be capable of being remotely mounted up to 100 meters from the transmitter, or 1,000 meters when used with a termination box.
(1) Mounting Hardware:
(2) The probe shall be provided with a pole or ball-float mounting hardware as required for the application or as indicated otherwise.
(3) Provide handrail mounting hardware when required for the application or as indicated.
g. The probe shall be rated for use in Class I, Division 2, Group D hazardous locations.
h. Shall be LDO Probe (Model 2) as manufactured by Hach Company.
i. Analytical Controller/Transmitters shall be as specified in this Section.

B. pH Analyzers:
1. The system shall consist of a digital sensor electrodes, preamplifier, and analyzer/transmitter.
2. pH Sensor:
a. Differential type with two measuring electrodes and an internal reference electrode.
b. Replaceable salt bridge.
c. Encapsulated electronics.
d. Built-in temperature sensor for automatic temperature compensation and transmitter display.
e. Operating range shall be 2-12 pH.
f. Combination measuring/reference assembly.
g. Operating Range of -5 to 70°C.
h. Measuring electrode shall be glass tip with silver-chloride internal element.
i. Reference electrode shall be gel type, non-flowing silver-chloride in saturated potassium chloride electrolyte.
j. The probe shall be rated for use in Class I, Division 2, Group D hazardous locations.
k. Hach Company pH sensor Model DPD1P1 or equal.
3. Electrode Mounting Assembly:
a. Convertible style with 1-inch NPT threads on each end and suitable for flow through, insertion, or immersion as specified in this Section.
b. Shall be provided with a guard to protect glass electrode tips from breakage.
c. Wetted parts shall be constructed of a material compatible with the solution being measured.
d. Provide a temperature sensor for automatic temperature compensation.
e. Provide cable length as required between sensor and transmitter.

C. ORP Analyzers:
1. The system shall consist of a digital sensor, preamplifier, and analyzer/transmitter.
2. ORP Sensor:

a. The ORP sensor shall be of differential electrode technique design using two measuring electrodes to compare the process value to a stable internal reference standard buffer solution. The standard electrode shall have non-flowing and fouling-resistant characteristics. Reference electrode shall be gel type, nonflowing silver silver chloride in saturated potassium chloride electrolyte.
b. The sensor shall be suitable for immersion applications and shall be constructed of 316 stainless steel with a platinum or gold electrode.
c. The built-in electronics of the sensor shall be completely encapsulated for protection from moisture and humidity.
d. The sensor shall include built-in digital electronics.
e. The sensor signal shall have an integral temperature sensor to automatically compensate measured values for changes in process temperature.
f. The sensor shall include a titanium ground electrode to eliminate ground loop currents in the measuring electrodes.
g. The probe shall be rated for use in Class I, Division 2, Group D hazardous locations.
h. Provide with mounting hardware style and accessories as indicated.
i. The sensor shall be HACH DRD1P5 or engineer approved equal.

3. Electrode Mounting Assembly:
a. Designed for flow through, insertion, or immersion as specified in this Section.
b. Immersion type shall be provided with a guard to protect glass electrode tips from breakage.
c. Wetted parts shall be constructed of a material compatible with the solution being measured.
d. Provide with an integrated temperature sensor for automatic temperature compensation.
e. Provide a preamplifier mounted in the electrode assembly.

D. Total Suspended Solids (TSS) Analyzers:
1. The suspended solids system shall consist of an immersion/insertion style sensing probe and analyzer/transmitter.
2. The system shall measure turbidity and suspended solids in the range of 0-9999 NTU and 0-500g/L respectively. Final
3. Accuracy shall be less than 5% of measured value or ±0.01 NTU, whichever is greater for turbidity.
4. Repeatability shall be better than 3.0% of reading for turbidity and 4.0% for solids (TS).
5. Sensor:
a. Double optical system with two pulsating infrared LEDs and four receivers.
b. Light shall be scattered with the receivers detecting the incident light at 90 and 120 degree angles for suspended solids and at 90-degrees for turbidity in accordance with DIN/E27027/ISO 7027.
c. The wavelength for both parameters shall be 860nm.
d. The measurement system shall be equipped with bubble and temperature compensation software.
e. Sensor shall be capable of immersion in a tank [or inserted into a pipe depending on the application].
f. Shall be constructed of stainless steel.
g. High polished sensor head for self-cleaning action and a scratch-resistant sapphire window for harsh environments.
h. Provide interconnecting cable between sensor and transmitter.

i. Rated for use in Class I, Division 2, Group D hazardous locations.
j. Hach Company sensor Model TSS Ex1 sc for hazardous locations and TSS sc for non-hazardous locations.

6. Accessories:
   a. Provide Stainless Steel ball valve and Tri-Clamp mounting hardware for pipe mounting when indicated.
   b. Provide pole mounting hardware when indicated.
   c. Provide all required fittings and accessories for complete installation.

E. Ultraviolet Transmittance (UVT) Analyzer:
1. The system shall consist of a sensing probe and analyzer/transmitter.
2. Sensing Probe:
   a. The sensing probe shall be designed to continuously monitor UV absorbance and percent transmittance in water.
   b. Method of measurement shall be determining the Spectral Absorption Coefficient (SAC) at a wavelength of 254 nm using a 2-beam ultra-violet absorption technique with a 1, 2, 5 or 50 mm path length.
   c. Sensor path length shall be selected by the UV System Equipment Supplier.
   d. The sensing probe shall be constructed of a 316-stainless steel. All parts of the probe shall be corrosion-resistant and fully-immersible.
   e. Sensor shall include a self-cleaning wiper system to automatically clean the detector window.
   f. The probe shall be rated for sample temperatures of 2 to 40°C, with a pH range of 4.5 to 9.
   g. The probe shall have an integral sensor cable with a continuous length of cable for connection to the transmitter at location indicated. The cable shall be terminated with a quick-disconnect plug. Cable length shall be 30 feet minimum.
   h. The probe shall be provided with a 90 degree adapter and mounting hardware as required for the application or as indicated.
   i. Shall be UVAS plus sc as manufactured by Hach Company.

F. Phosphate Analyzer:
1. The analyzer shall utilize the vanadomolybdate yellow colorimetric method to measure ortho-phosphate.
2. Housing shall be NEMA 4X/IP55 rated and designed for wall mounting.
3. The measurement range shall be 0.05 to 15.00 mg/L and be accurate with ±2% of calibrated span.
4. Operating temperature range of -20 to 45°C operation.
5. The sample response time shall be 5 minutes maximum, including sample preparation.
6. Sample temperature range of 4 to 40°C.
7. Analyzer shall be self-cleaning and zero-calibrate automatically and equipped with self-diagnostics.
8. A sample filtration system shall be provided to condition the sample for the analyzer.
   a. The sampling system shall consist of a control unit, submersible filter module holder and sample delivery hose to deliver a sample at a rate of up to 900mL/h.
   b. Enclosures shall be constructed of stainless steel and rated IP55. The control unit enclosure shall be internally heated for outdoor installation and suitable for an operating range of -20 to 40°C (-4 to 104°F).
   a. Suction and Sample delivery hoses shall be heated. Provide length of hose as required for the indicated installation.

b. The controller shall include a menu-driven display for monitoring the unit. Self-diagnostics shall provide monitoring of components and include alarm notification for operator error messages.
(1) The controller shall include two programmable alarm relays rated for 120Vac, 3A as minimum.
c. The system shall include a built-in air purge system to reduce adhesion of solids to the filter membranes.
d. The unit shall operate from a single 120Vac power supply.

9. The Analyzer shall operate from 120Vac as supplied from the controller/transmitter or from the "power box" accessory. Provide an accompanying analytical controller/transmitter as specified in this section.
10. Provide the necessary rail mounting kit and associated hardware for the analyzer housing and the required transmitter.
11. Provide Hach Company PHOSPHAX sc Phosphate Analyzer, Filtrax filtration system, and SC4500 controller with power box accessory.

G. Analytical Controllers/Transmitters:
1. Controller/Transmitters shall be provided for each of the specified analytical sensors. The transmitter shall be a microprocessor-based controller with plug and play connection of associated sensors.
2. Menu driven software to allow for straight forward calibration and selection of display parameters.
3. A backlit touchscreen TFT color display shall be provided for programming and displaying operating parameters.
4. The transmitter shall be rated for -20 to 45°C operation at 20W or less sensor load.
5. Capable of monitoring a minimum of two separate sensing probes specified.
a. For areas that indicate more than two sensors are connected to a single transmitter, a multi-channel unit may be provided and combined with other analytical sensors specified in this Section.
6. The transmitter shall store all user settings in non-volatile memory (EEPROM).
7. The transmitter unit shall have a built-in data logger function.
8. Provide the following outputs:
a. Two SPDT, user programmable contacts each rated 5A at 120Vac.
b. Five independent analog 4-20mA outputs. Capable of handling an output impedance of up to 500 Ohms.
9. The controller shall include a minimum of two 10/100 Mbps Ethernet ports.
a. One port(s) shall be configured with EtherNet/IP communication protocols for integration into the indicated network.
10. Provide with a USB port for data download and software upload.
11. Enclosure shall be rated NEMA 4X and shall be capable of wall, pipe, or panel mounting.
12. Provide a sun shield for outdoor units to protect units from direct sun contact.
13. Shall operate on 120Vac.
14. Provide SC4500 controller or approved equal with specified options for up to two channel installations. Provide SC1000 controller base unit and an associated touchscreen unit or approved equal when more than two channels are required and indicated for a single location.

H. Instrumentation Mounting Panels (Wet Panels):
1. Transmitters, sensors, flow cells and sample piping shall be mounted, wired, and plumbed on an aluminum, PVC, or other heavy-duty non-metallic plate material suitable for wall mounting.

2. Refer to the Contract Drawings for group mounted instrument panel locations.

2.14 TOTAL SOLIDS (TS) METER:

A. The total solids (TS) metering system shall consist of a flow through sensor and transmitter with user interface.
B. The system shall utilize microwave-based technology to measure total solids in the range of 0-50% TS.
C. Sensitivity shall be 0.001% TS with a pressure measurement accuracy of ±1.5psi (0.1 bar) between 0-290psi (25bar).
D. Repeatability shall be better than ±0.01% for total solids (TS).
E. Sensor:
   1. Flow through design with AISI 316L stainless steel wetted parts.
   2. Sealing rings shall be EPDM (Rubber) or PTFE (Teflon).
   3. Stainless steel mounting hardware.
   4. Rated for use in Class I, Division 2, Group D hazardous locations.
   5. Provide interconnecting cable between sensor and transmitter. Length as required.
F. Unit shall be operable from -20 to 70°C (-4 to 158°F) and housed in a NEMA 4X rated enclosure.
G. Transmitter:
   1. The transmitter shall be a microprocessor-based controller plug type connection to sensor.
   2. A backlit touchscreen TFT color display shall be provided for programming and displaying operating parameters. The transmitter unit shall have a built-in data logger trending function.
   3. Suitable for operation within a -5 to 50°C (23 to 122°F) temperature range.
   4. Provide the following inputs and outputs:
      a. Two SPDT, user programmable output contacts each rated 2A at 120Vac.
      b. Two independent analog 4-20mA outputs. Capable of handling an output impedance of up to 500 Ohms.
      c. Four 24VDC/10mA isolated binary inputs.
   5. The controller shall include an Ethernet connection port and USB port for software updates and data backup.
   6. The enclosure shall be constructed of aluminum, rated NEMA 4X, and be capable of wall, pipe, or panel mounting.
   7. Shall operate on 120Vac, 10W or less sensor load.
H. Provide Valmet TS flow through sensor (TB) with Valmet Bridge operating terminal.

2.15 GAS DETECTION EQUIPMENT:

A. Controller:
   1. Provide a micro-processor based controller. The controller shall have a minimum of four channels designed to accept combustible or toxic gas detector head inputs as indicated and specified.
   2. Digital readout display for each channel that reads %LEL, PPM, or % Vol. Decimal may be set in any position.
   3. Inputs shall accept 4-20 mA signal for each channel.
   4. Controller shall have one 4-20 mA output for each channel.
   5. Housed in a NEMA 4X FRP or ABS enclosure.
   6. The controller shall include a minimum of one programmable alarm outputs per channel with an additional common fault alarm.

7. All functions shall be fully programmable through software or dip and push button switches.
8. UL Listed.
9. The unit shall be calibrated based on manufacturer recommendations for this project.
10. Provide MSA GasGard XL controller or Engineer approved equal.

B. Gas Sensing Transmitters:
1. Provide stand-alone combustible gas detection transmitters for gas monitoring as indicated.
2. Gas sensing transmitter shall include a 4-20mA output to indicate gas level.
3. Nonintrusive calibration via a magnetic wand.
4. User adjustable "calibration reminder" message.
5. LCD display with backlight for local indication.
6. Shall connect to Gas Controller as specified.
7. Housed in rugged, copper-free aluminum NEMA 4 explosion proof enclosure.
8. Gas type monitored shall be Methane or H2S as indicated.
9. Provide Rosemount, Emerson Millennium II series or Engineer approved equal.

C. Calibration Kit:
1. Provide one calibration kit for each type of Gas Detector Head provided.
2. Calibration kits shall be as recommended by the manufacturer for each type of detector used.

2.16 AMBIENT OZONE MONITORING EQUIPMENT:

A. Ambient ozone system monitoring shall be provided at the locations indicated in the Drawings and as specified.

B. The ambient ozone systems shall provide local and remote indication of an alarm condition.

C. At a minimum, units shall be provided as indicated on the project instrument list. If additional units are required to provide complete coverage and personnel protection within the space as determined by the ozone system supplier (OSS), they shall be provided.

D. Gas Detectors:
1. Provide ambient ozone units with sensing elements.
2. Ozone units shall be provided with integral sample pump and sample intake to allow sample to be collected near floor level. Provide required cabling and/or tubing for sampling.
3. Provide ozone destructor on sensor discharge of ozone monitors.
4. Transmitters:
a. Electronic, microprocessor based with an integral backlit LCD display and pushbuttons for unit setup.
b. Powered from 120Vac.
c. Provide with a 4-20mA outputs proportional to gas level. Provide one (1) output per sample stream.
d. Provide with one alarm relay and one fault relay rated a minimum rated for 5Amps at 30Vdc and 120Vac.
e. Enclosure shall be NEMA 4X rated designed for wall mounting.
f. The ambient ozone monitor shall have adjustable alarm setpoints and will energize an alarm for the following alarm setpoints:
(1) High alarm: 0.1 ppm (ozone concentration alarm setpoint not to exceed 0.1 ppmv).
(2) High-high alarm 0.3 ppm (ozone concentration alarm setpoint not to exceed 0.3 ppmv).

5. Ozone Sensors:
   a. Ultraviolet absorption ozone photometer-type instrument to detect Ozone concentration in air.
   b. Shall have a range of detection adjustable from 0-1 ppm to 0-500 ppm.
   c. Shall include an internal ozone scrubber.
      The sensor's exhaust shall be vented outdoors. All required piping and installation shall be provided by the OSS.
   d. The sensor shall include a minimum of three ozone sample streams. If additional streams are required to provide complete coverage and personnel protection within the space as determined by the ozone system supplier (OSS), they shall be provided.
6. OSS shall provide gases for startup, testing, and initial calibration.
7. Provide Teledyne 465L or Engineer-approved equal.

2.17 DIFFERENTIAL AND GAUGE PRESSURE TRANSMITTERS:

A. Electronic, two-wire type with a 4-20mA output and integral LCD display for use in both pressure and hydrostatic level applications.
B. Stainless steel Aluminum body with stainless steel wetted parts.
C. Sensor fill fluid shall be silicone oil unless recommended otherwise by the manufacturer.
D. Measuring element shall be a resonant wire or strain gauge type.
E. Process connections. Provide one of the following connection types as indicated or required for the application. Refer to instrument list and P&ID drawings for requirements.
   1. Provide unit with direct connect 2-inch ASME Class 150 flange when indicated.
   2. Provide 1/2-inch NPT when indicated.
   3. Provide with a fitted pressure sensor/annular seal when indicated.
F. Accuracy including hysteresis, linearity, and repeatability shall be within ±0.20% of calibrated span.
G. Provide zero, span, and damping adjustments. Zero adjustment shall be external.
H. Zero suppression or elevation shall be adjustable to a minimum of 100% of calibrated span.
I. Enclosure shall be NEMA 4X epoxy coated aluminum.
J. Enclosure shall be rated IP68 for continuous submergence when installed in below grade vaults.
K. For units installed in hazardous locations, shall be rated for use in a Class 1, Division 1 and 2, Group D atmosphere.
L. Designed for wall or pipe mounting.
M. Pressure Sensors/Annular Seals shall be as follows:
   1. Annular seals shall be provided for wastewater and harsh or abrasive chemical applications when indicated for pressure transmitters.
   2. Sensor shall be full flange, flow through design with flexible elastomer sensing ring around the full circumference. The pressure sensing ring shall measure pressure for 360° around the full inside circumference of the pipe.
   3. For level applications sensor accuracy shall be ±2" or better.
   4. Flexible sensing ring shall have a cavity behind the ring filled with fluid to transfer pressure to transmitter.
   5. Flange bolts shall pass through sensor body and flanges. Flange type and pressure class shall match the adjoining pipes flange type and pressure class.
   6. The manufacturer shall fill pressure sensor and transmitter assembly with silicone oil and calibrate unit prior to shipment.
   7. Pressure sensors shall be Red Valve Co. Series 40 or Engineer-approved equal.

N. Accessories:
1. Stainless steel three-valve manifold for all differential pressure transmitters.
2. Stainless steel two-valve block and bleed manifold for all pressure transmitters.
3. Provide stainless steel mounting bracket for units indicated to be wall mounted.
4. Provide sealing diaphragms for hydrostatic level applications and other locations indicated.
5. Provide pulsation dampeners (snubbers) in pressure transmitter sensing lines located at pump discharge.
6. Provide with remote atmospheric pressure compensation tube when required.

2.18 PRESSURE SWITCHES AND GAUGES:

A. Diaphragm Switches:
1. Diaphragm sealed pressure switch with stainless steel wetted parts.
2. NPT process connection, size as required.
3. Snap action SPDT switch rated 4 amps at 120Vac minimum.
4. Housed in a NEMA 4X enclosure, unless specified otherwise.
5. Adjustable pressure set point.

B. Bourdon Tube Switches:
1. Brass bourdon tube element.
2. SPDT switch rated 4 amps at 120Vac minimum.
3. Housed in a NEMA 4X enclosure, unless specified otherwise, with a front mounted glass viewing window for observing switch settings.
4. Adjustable differential with independent adjustment knobs for the upper and lower operating points. Adjustable over the operating range.

C. Pressure Gauges:
1. Shall be minimum 4-1/2” dial size.
2. Phenolic or aluminum case and ring. Case and ring material shall match.
3. Liquid filled (Glycerin).
4. Acrylic window with rotary movement.
5. Accuracy shall be ±0.5% of span.
6. Shall include 1/4 inch NPT process connection and stainless steel gauge cock unless specified otherwise.
    a. Process connection location shall be selected based on each application and as indicated for lower, top, and side connections.
7. Wetted components shall be 316 SS.
8. Pressure range shall be as specified for each application.

D. Pressure Sensor/annular seal shall be provided for pressure instrumentation as follows:
1. Provide pressure sensors when indicated.
2. Sensor shall be full flange design.
3. Sensor shall be flow through design with flexible elastomer sensing ring around the full circumference. The pressure sensing ring shall measure pressure for 360° around the full inside circumference of the pipe.
4. For level applications sensor accuracy shall be ±2" or better.
5. Flexible sensing ring shall have a cavity behind the ring filled with fluid to transfer pressure to transmitter.
6. Flange bolts shall pass through sensor body and flanges. Flange type and pressure class shall match the adjoining pipes flange type and pressure class.
7. The manufacturer shall fill pressure sensor and transmitter assembly with silicone oil and calibrate unit prior to shipment.

8. Pressure sensors shall be Red Valve Co. Series 40 or Engineer-approved equal.

2.19 TEMPERATURE TRANSMITTERS:

A. Provide loop powered temperature transmitter for monitoring of air or liquid temperature.
B. NEMA 4X aluminum housing with LCD display.
C. Provide 4-20mA analog signal proportional to temperature.
D. Suitable for wall or process mounting.
E. Spring loaded platinum RTD sensing element.
F. Provide compact stainless steel sensing element when used for ambient air sensing applications.
G. Provide stainless steel thermowell with a 4-inch immersion length and a 1-inch process connection when used for liquid or air sensing in a pipe.

2.20 TEMPERATURE SWITCHES:

A. Provide adjustable temperature switch as indicated and specified.
B. Nominal temperature setting shall be adjustable over the full operating range. Setpoints and ranges shall be as indicated.
C. Shall have a minimum of one SPDT relay output that shall close when the temperature drops below or rises above the set point as required for the application.
D. Relay output shall be rated a minimum of 5 Amps at 120Vac.
E. NEMA 4X enclosure for non-hazardous locations. NEMA 4X with hermetically sealed switch or NEMA 7 enclosure for use in Class I, Division 1 and 2 locations.

2.21 LIMIT SWITCHES:

A. SPDT contacts rated 5 amps at 120Vac minimum.
B. Snap action type switch in a NEMA 4 or 4X enclosure.
C. Operator type as required for the function specified or indicated.

2.22 FLOW SWITCHES:

A. Vane type:
   1. Liquid flow switch to detect a flow/no flow condition.
   2. For installation in line size(s) as specified or indicated. Paddle size shall be selected according to installed pipe size.
   3. 316 Stainless steel body. Wetted materials shall be 316 stainless steel.
   4. Process connection shall be 1″ NPT unless indicated otherwise.
      a. When required for high flow applications connection size may be increased per manufacturer recommendations.
   5. Sensitivity adjustment over units entire flow range. Flow range shall be selected based on the application.
   6. SPDT snap switch rated for 120Vac, 5A minimum.
   7. Integral termination enclosure with screw type terminal connections.
   8. NEMA 4X or 7 rated enclosure as applicable for the environment.
   9. Manufactured by McDonnell & Miller (FS series), Dwyer Instruments (Series V4), or approved equal.
B. Thermal dispersion type:
   1. Insertion flow switch. Suitable for detecting no flow condition of process fluid specified.
   2. Field adjustable switch point. Flow range shall be as specified or as selected by packaged system manufacturer.
   3. Install in piping with orientation as recommended by switch manufacturer.

4. Probe insertion length shall be as required for application and installation conditions.
5. Wetted parts constructed of: 316/316L stainless steel.
6. 120Vac supply voltage with two SPDT relays. Minimum contact rating of 5 Amps @ 120Vac.
7. Epoxy coated aluminum or 316 stainless steel, NEMA 4 enclosure with stainless steel identification tag.
8. Operating temperature range of -40 to +140°F minimum.
9. Magnetrol, Model TD1/TD2, or approved equal.

2.23 SOLENOID VALVES:

A. Solenoid operated, two way, three way, and four way control valves.
B. Molded Class F or Class H, 120Vac coil in NEMA Type 4X enclosure.
C. Shall be UL listed for Class 1, Division 2 locations when installed within a classified space.
D. Stainless-steel body.
E. Integral maintained manual operator.
F. Spring return to normal, except for double coil valves.
G. Provide with electrical transient surge suppressor installed across coil.

2.24 INDICATORS:

A. Digital Panel Meters (LED):
   1. 7-segment light emitting diode (LED) display.
   2. 0.5 inch high digits, number as specified.
   3. Input signal shall be 4-20 mA dc.
   4. Readout shall be in engineering units specified.
   5. A/D conversion shall be dual slope integration method.
   6. Zero offset and span adjustments shall be factory set as specified and shall be field adjustable.
   7. Shall operate from a 120Vac, 60 hertz power supply.
   8. Field selectable decimal point.
   9. Normal Mode Rejection Ratio shall be 40 dB or greater at 60 hertz and Common Mode Rejection Ratio shall be 80 dB or greater from dc to 60 hertz.
   10. Housed in a NEMA 4X, aluminum enclosure or panel mounted enclosure as applicable.
   11. Provide barrier terminal strips for external connections.
   12. Furnish with mounting brackets and trim strips.
   13. Shall include an isolated 4-20mA output when indicated or required to drive external inputs.

B. Digital Panel Meters (LCD, Loop Powered):
   1. Dual-line 7-segment liquid-crystal display (LCD) display with backlight.
   2. 0.5 inch high digits or greater. Shall have a minimum of 5 digits.
   3. Input signal shall be 4-20 mA dc.
   4. Readout shall be in engineering units specified.
   5. A/D conversion shall be dual slope integration method.
   6. Zero offset and span adjustments shall be factory set as specified and shall be field adjustable.
   7. Shall be powered from the 4-20mA loop power supply.
   8. Field selectable decimal point.
   9. Normal Mode Rejection shall be 60 dB or greater at 60 hertz.
   10. Housed in a NEMA 4X, high impact plastic or aluminum enclosure. Designed for panel mounting when indicated.

11. Provide barrier terminal strips for external connections.
12. Furnish with mounting brackets and trim strips.

C. Large Display Process Meters:
1. Seven segment LED display housed in a NEMA 4X aluminum enclosure.
2. Enclosure designed for wall mounting with provisions for conduit entry.
   a. When indicated provide enclosure designed for panel mounting. Provide necessary mounting bracket and trim strips.
3. Minimum 2.25-inch or 4-inch high red digits as indicated.
4. Minimum 4 1/2 digit display.
5. Powered from 120Vac.
6. Accuracy of ±0.05%.
7. Input signal shall be 4-20mA.
8. Screw type terminal blocks.
9. Shall include an isolated 4-20mA output when indicated.

D. Accessories:
1. Provide outdoor mounted indicators with stainless steel sunshield to protect display from sunlight and to allow for daylight viewing.

2.25 AUDIBLE AND VISUAL DEVICES:

A. Electro-Mechanical Horns:
1. Die-cast zinc housing with a corrosion-resistant grey powder-coat finish and stainless steel hardware
2. Shall be housed in a NEMA 4X, IP65 enclosure and be UL Listed for indoor/outdoor use.
3. Provide with panel gasket kit or weatherproof back box as applicable for the application.
4. Vibrating horn with stainless steel diaphragm produces 100dB @ 10 feet at maximum setting.
5. External volume control shall be provided by a set screw adjustment.
6. Shall operate from a 120Vac Power Source.
7. Suitable for indoor and outdoor use.
8. Provide Federal Signal Model No. 350WB-120 with WB backbox or Engineer approved equal.
9. Install at locations indicated.

B. Electro-Mechanical Horns (Hazardous Location):
1. Die-cast zinc housing with a corrosion-resistant polyurethane finish and stainless steel hardware
2. Vibrating horn with stainless steel diaphragm produces 100dB @ 10 feet at maximum setting.
3. External volume control shall be provided by a set screw adjustment.
4. Shall be housed in a NEMA 4X, IP66 enclosure and be UL listed for Class 1, Division 2 locations.
5. Shall operate from a 120Vac Power Source.
6. Suitable for indoor and outdoor use.
7. Provide Federal Signal Model No. 350WBX or Engineer approved equal.
8. Install at locations indicated.

C. Alarm Strobes:
1. Double flash, high intensity strobe light with a rate of 80 flashes per minute.
2. Red polycarbonate dome with a maximum dome height of 5 inches.
3. Shall operate from a 120Vac Power Source.
4. Shall be housed in a NEMA 4X, IP66 enclosure and be UL Listed for indoor/outdoor use.

5. Provide with the necessary mounting hardware required for wall mounting, panel mounting, or 1/2" NPT male pipe mounting.
6. Provide Federal Signal Model No. LP3M-120R or Engineer approved equal.
7. Install at locations indicated.

D. Alarm Strobes (Hazardous Location):
1. Double flash, high intensity strobe light with a rate of 80 flashes per minute.
2. Aluminum housing with stainless steel hardware.
3. Red polycarbonate dome.
4. Shall operate from a 120Vac power source.
5. Shall be housed in a NEMA 4X, IP66 enclosure and be UL listed for Class 1, Division 2 locations.
6. Provide with the necessary mounting hardware required for wall mounting, panel mounting, or 1/2" NPT male pipe mounting.
7. Provide Federal Signal Model No. 151XST or Engineer approved equal.
8. Install at locations indicated.

PART 3 - EXECUTION

3.01 EXAMINATION:

A. Verify site conditions are suitable for installation of instrumentation and associated equipment.

3.02 INSTALLATION:

A. Panel Mounted Devices: As specified in Section 40 67 00 – Process Control Panels and Hardware.

B. Field Mounted Devices:
1. Install as follows:
a. Mount on floor or wall as required.
b. Mount plumb and level.
c. Mount on walls with bottom of box or instrument four feet above floor unless indicated otherwise and instrument case spaced at least 1/2-inch away from wall.
d. Install supports as specified this Division and as indicated.
e. Install floor-mounted instruments on strut support racks.
f. Install measuring and controlling instruments in accordance with manufacturer's written instructions.
g. Install identification tags on all instruments.
2. Connect inputs and outputs as indicated on the manufacturer's shop drawings and as follows:
a. Transmitters requiring electric power shall be supplied from their associated control panels unless indicated otherwise.

3.03 FIELD QUALITY CONTROL:

A. Manufacturer's field services:
1. Manufacturer's field services shall be provided as specified in this Section, Section 40 60 00, and in Division 01.
2. Provide a minimum of 2 hours for each instrument to supervise/inspect installation, commission, test and start-up all equipment provided.
3. All equipment required for testing, start-up and performance verification shall be provided by the start-up technician.
4. All travel and living expenses shall be included.

B. Field Testing:
   1. Test and start-up supervision shall continue until the system is in proper operating condition as determined by Engineer.
   2. Provide manufacturer's supervision during Work to correct deficiencies in Equipment manufactured by them and to correct deficiencies in the installation and wiring of Equipment. Corrections shall be at no increase in the Contract Price.
   3. Functional Testing of Controls:
      a. Perform before equipment is placed in service.
      b. Include operating control system from each control point.
      c. Completely check each annunciator point and equipment alarm.
      d. Operate by hand all relays, pressure switches, limit switches and other system components that cannot be operated in normal manner with plant not in service.
      e. Repeat with plant in operation.
   4. Instrument Tests and Adjustments:
      a. Calibrate and startup measuring and controlling instruments in accordance with manufacturers recommendations.
      b. With each system variable transmitter disconnected from its normal source of input signal, apply an input with manometer, instrument potentiometer, or other device and adjust span and zero on all instruments transmitting, receiving, or retransmitting the resulting variable current, voltage, time duration or pneumatic signal and on all final control devices. Check instruments and final control devices at several points over the instrument measuring or control device span.
      c. Apply manually adjustable time duration or current signals directly to receivers where required to adjust zero and span and to check operation of the instrument over the measuring span.
      d. Accurately measure variable current, voltage, time duration and pneumatic signals as required to adjust all receivers, transmitters, transducers, and final control devices.
      e. Check operation of controller with various set points and system variable inputs; adjust controller proportional band, reset, and rate to conform to instructions from manufacturer's representative and Engineer.
      f. Check operation of each instrument with system in actual operation.
      g. Readjust controller settings as required to obtain desired control of the associated system variables.

3.04 TRAINING:

A. Provide a minimum of 2 hours of training at the customer's facility for operations, maintenance, and service personnel for each type of instrument provided.
   1. The training session shall include classroom discussion on the theory of operation of the equipment, as well as maintenance and service methods for the purchased equipment.
   2. Topics covered shall include safety, hardware layout and functions, power and control wiring, diagnostic indicators, keypad/display interface, faults, diagnostic tools, troubleshooting, and preventive maintenance.
   3. Hands-on training shall be provided on equipment.
   4. Documentation shall be provided which shall include actual manuals for the equipment and drawings and schematics of equipment supplied for this project.

B. Contractor shall record the training sessions and provide a final edited version to the Owner in electronic video file format.

C. Training shall conform to the requirements of Section 01664 – Training.

END OF SECTION 40 70 00

NOTES:

1. 120VAC POWER SOURCE FOR INSTRUMENT TRANSMITTER SHALL BE SUPPLIED FROM WITHIN THE ASSOCIATED PLC CABINET
2. PROVIDE SURGE PROTECTIVE DEVICE(S) (SPD) FOR INSTRUMENT.
3. RANGE INDICATED IS DESIGN BASIS. COORDINATE FINAL INSTRUMENT RANGE WITH ACTUAL TANK SUPPLIED
4. INSTALL INTRINSICALLY SAFE BARRIER (DISCRETE SIGNAL) IN THE ASSOCIATED CONTROL PANEL/PLC CABINET FOR THE INDICATED INSTRUMENT. POWER FOR INSTRINSICALLY SAFE BARRIER SHALL BE SUPPLIED FROM THE ASSOCIATED CABINE˙
5. SUPPLY INSTRUMENT WITH MANUFACTURER CABLE FOR CONNECTION OF ELEMENT TO TRANSMITTER AS SPECIFIED
6. INSTRUMENT IS SUPPLIED BY VENDOR OF THE PROCESS SYSTEM. RANGE/SETPOINT TO BE DETERMINED BY VENDOR.

SECTION 40 71 90 – PARSHALL FLUME LINER

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the furnishing and installation of a Parshall flume liner as indicated in the Contract Drawings and in accordance with the Manufacturer's recommendations.

B. Related Work Specified Elsewhere:

1. Instrumentation for Process Systems: Section 40 70 00.

1.02 REFERENCES:

A. Applicable Codes and Standards: Design, fabricate, assemble, and test Equipment and Materials so that upon installation in accordance with the manufacturer's recommended procedures for this application, the Equipment will conform to the requirements of the Federal Occupational Safety and Health Standards and the applicable provisions of:

1. U.S. Department of Agriculture Soil Conservation Service (USDA-SCS):
   a. Circular No. 843, Measuring Water in Irrigation Channels with Parshall Flumes &* Weirs.
   b. National Engineering Handbook, Section 15, Chapter 9.
2. U.S. Department of the Interior, Bureau of Reclamation (BUREC):
   a. Water Measurement Manual.

1.03 SUBMITTALS:

A. Submit as specified in Division 1.

B. Submittals shall include, but not be limited to, the following:

1. Drawing or illustration showing liner dimensions, construction, structural support, and anchorage.
2. Drawing or illustration showing level staff gauge, construction, markings, and anchorage.
3. Certified listing of materials of construction for the liner and staff gauge.
4. Manufacturer's recommended installation procedure.
   a. Leveling, lifting, and alignment procedures and requirements.
   b. Internal and external bracing requirements.
5. Certificates and Affidavits: As specified in Divisions 2 through 16.

C. Submit shop test reports and performance data specified in paragraph 1.04A below.

D. Submit complete operation and maintenance manuals for all equipment.

1.04 QUALITY ASSURANCE:

A. As specified in Division 1.

B. Factory Tests and Reports:

1. Include all manufacturer's standard factory tests on Equipment and Material.
2. The written test reports shall be provided within seven days after completion of the final test. Retesting will be required if written test reports are not received in timeframe indicated or if tests fail requirements.
3. Submit test reports to Engineer.

1.05 FACTORY ASSEMBLY:

A. As specified in Division 1.

1.06 DELIVERY, STORAGE, AND HANDLING:

A. As specified in Division 1.

B. Delivery, storage, and handling shall conform to the following requirements:

1. Provide bracing and protection to avoid damage to the liner and staff gauge during shipment, storage, and handling.
2. Maintain bracing and protection until the liner and gauge are ready for installation.
3. Avoid handling liner with hooks, clamps, or other surface damaging devices.

1.07 WARRANTY:

A. As specified in Division 1.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Badger Meter, Inc., Precision Products Division.
B. B.I.F. Industries – Unit of General Signal.
C. Fischer & Porter.
D. Hinde Engineering Co. of California, Inc.
E. F. B. Leopold Company, Inc. – Mueller Co.
F. Plasti-Fab Inc.
G. Warmister Fiber Glass, American Meter Div., Singer Co.
H. Kenco Plastics Company, Inc.
I. Engineer Approved Equal.

2.02 PARSHALL FLUME LINER:

A. Constructed of fiberglass reinforced polyester plastic resin:
   1. Not less than 30% fiberglass by weight.
   2. Sanitary satin finish on all surfaces exposed to flow.
   3. One-piece unit construction with integrally molded external ribs and flanges for strength and anchorage.
   4. Provide resin for temperature limit to 150°F.
B. Sufficiently rugged to withstand normal handling and installation.
C. Dimensions to conform to USDA-SCS Circular No. 843.
D. Operational sizing parameters:

Throat Size (inches)	Minimal Wall, t (inches)	Minimum Flow (MGD)	Maximum Flow (MGD)
36	¼	2.0	15.0

   1. Provide all attachment materials, fasteners, and appurtenant connections.
   2. Discharge flow rates are free flow capacity values.

2.03 LEVEL STAFF GAUGE:

A. Provide a level staff gauge as an integral part of the side wall of the flume.
   1. Fabricate from materials compatible with the fluid measured without discoloration, deterioration, or corrosion.
   2. Provide for future removal and replacement of attached gauge.
   3. Resistant to ultraviolet light and weather extremes.
B. Color of the gauge face: white.
C. Color of all gauge markings: black.
D. Graduations of the gauge in hundreths of a foot with:
   1. 5/8-inch high numerals at each 0.1 feet.

2. Offset 1-inch high numerals at each 1.0 foot.
3. Increase length of graudation at each 0.1 and 1.0 foot interval.

E. Minimum width of gauge: 2-1/2 inches.
F. Length of gauge: Full depth of flume liner.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Refer to “Manufacturers Field Services” in Division 1 for requirements for startup.
B. Installation, start-up, and testing of all Equipment and associated construction shall conform to Manufacturer's recommendations.
   1. The floor of the inlet or converging section must be level in both directions.
C. Adequately brace and protect liner during installation to prevent deformation or damage.
   1. Provide full face bracing or formwork inside the liner.
      a. On sidewalls and bottom.
      b. Make an integral part of the channel formwork.
      c. Bracing joints at least 12 inches from edge of liner.
   2. Limit surface deflection to 1/8-inch in 4 feet in any direction.
D. Install roofing felt between liner and bracing or formwork to prevent damage to the liner surface.
E. All metal fastners or appurtenances – 304 stainless steel.
F. Cover all penetrations in the shop or field with fiberglass and resin.
   1. Furnished by the Manufacturer for this purpose.
   2. Apply in accordance with Manufacturer’s recommendations.
G. Level instrumentation shall be provided and installed for the flume according to Section 40 70 00 and as indicated on the Contract Drawings.

3.02 FIELD TESTING:

A. As specified in Division 1.

3.03 MANUFACTURER TRAINING:

A. As specified in Division 1.

3.04 INSPECTION:

A. As specified in Division 1.

END OF SECTION 40 71 90

SECTION 41 22 00 - CRANES AND HOISTS

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the following types of Equipment:
   1. Trolley hoist on monorail beam(s).
      a. Location: Influent Pump Station (qty 1)
      b. Location: AGS Pipe Gallery (qty 3)

B. General requirements for crane and hoist required are defined in this Specification.

C. Related Work Specified Elsewhere:
   1. Electrical: DIVISION 26.
   2. Structural: See drawings for monorail beam length(s).

1.02 REFERENCES:

A. Applicable Standards:

   10. National Electrical Code (NEC), Article 610.
   11. National Electrical Manufacturers Association (NEMA).
   12. Society of Automotive Engineers (SAE).

1.03 SUBMITTALS:

A. Submit as specified in DIVISION 01.

B. Include, but not limited to, the following:
   1. Product Data:
      a. Specifications and manufacturer's data.
      b. Catalog cuts.
      c. Fabrication and erection Drawings, and details.
      d. Operation and maintenance manuals.

1.04 QUALITY ASSURANCE:
A. Provide the services of a factory representative to place cranes and hoists in service in the event it does not function in an acceptable manner, or in the event of erection difficulties requiring expert advice from the manufacturer.
B. When more than one trolley hoist is furnished under this Contract, all trolley hoists shall be supplied by one manufacturer only.

1.05 DELIVERY, STORAGE, AND HANDLING:
A. Store and handle crane(s) to prevent warping or racking of members.
B. Protect all components from damage by weather and operations on the Site.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:
A. Subject to compliance with requirements specified, provide products of one of the following:
   1. Trolley Hoists:
      a. ACCO – Acco Material Handling Solutions
      b. Or Architect approved equal.

2.02 TROLLEY HOIST:
A. General Requirements:
   1. Conform to ANSI/ASME B30.16 except as otherwise indicated.
   2. Conform to requirements for individual cranes and trolley hoists as indicated on Drawings and Specifications.
   3. Paint system shall be standard of manufacturer.
   4. Rated capacity shall be permanently marked one each side of unit.
B. Electric-Motor Operated Trolley Hoist:
   1. Required capacity at the Influent Pump Station: 3 ton.
      a. Environment: Outdoor, uncovered.
      b. Quantity: 1
      c. Type:
         (1) Electric, heavy-duty, lug-mount hoist.
         (2) Double-reeved, wire rope.
         (3) Single-speed lift. 22 fpm minimum.
         (4) Required hook lift: 55’- 0”
         (5) Trolley to be motorized drive and lift type.
         (6) Harsh environment hoist motor w/heater & weatherproof brake.
         (7) Harsh environment trolley motor w/heater & weatherproof brake.
         (8) NEMA 4X fiberglass or stainless enclosure.
         (9) Control heater w/T-stat.
         (10) Drop down lugs w/rubber bumpers.
         (11) Synthetic oil in hoist gearbox.
         (12) Drum coated w/Rust-Guard or Architect approved equal.

(13) Epoxy type urethane enamel hoist paint.
(14) All conduit entries at bottom of enclosures.

d. Manufacturer's model shall be as follows:
(a) ACCO – Acco Material Handling Solutions
Wright
Work Rated
New Century Series
Electric Wire Rope Hoists
3 Ton Monorail Hoist
Series 32
2 part double reeved
3/8 diameter rope
C2W03D060-22*2D0

2. Required capacity at the AGS Pipe Gallery: 1 ton.
a. Environment: Interior with moisture.
b. Quantity: 3
c. Type:
(1) Electric, heavy-duty, lug-mount hoist.
(2) Double-reeved, wire rope.
(3) Single-speed lift. 15 fpm minimum.
(4) Required hook lift: 30'- 0"
(5) Trolley to be motorized drive and lift type.
(6) Control heater w/T-stat.
(7) Drop down lugs w/rubber bumpers.
d. Manufacturer's model shall be as follows:
(a) ACCO – Acco Material Handling Solutions
Wright
Speedway
New Century Series
Electric Wire Rope Hoists
1 Ton Monorail Hoist
Series 31
2 part double reeved
3/16 diameter rope
C1W01D032-15*2D0

3. General Construction:
a. Conform to HMI 100.
b. Unit shall have automatic weston mechanical load brake, automatic upper-limit switch, geared upper and lower hook travel limit switch, overload device, and safety hook latch.
c. Motor shall be fully enclosed, heavy-duty, with high starting torque.
d. Trolley shall be provided with electronic soft-start controllers for smooth starting.
e. Disc type hoist motor brake.
f. Trolley motor brake.

4. Operation:
a. Operation shall be by means of control pendant suspended from a cable reel on the trolley hoist for operation with top of station located 3'-0" above the lower-level floor at the AGS and top of concrete at the Influent Pump Station.
b. Individual 6 push buttons to control hoist and trolley for electric operation. Pendant shall also have "start-stop" button to actuate the main line contactor.

c. Pendant shall be of nonconductive material.
d. Control(s) shall be single-speed, magnetic-type consisting of heavy-duty reversing type contactors interlocked and energized by push buttons. Control voltage shall be 115V ac.
(1) Control panels shall be enclosed in nonventilated enclosures conforming to NEMA 4X.

5. Electrification:
a. Electric Power: 3 phase, 60 hertz, 460Vac.
b. Electrical system for powering the hoist and trolley shall be Rigid "C" track festoon system with flat wire cross conductors for power and controls.
(1) "C" track to be minimum of 14-gauge galvanized steel.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Inspect all areas and surfaces for conditions detrimental to proper installation. Do not proceed with installation until conditions are satisfactory.

3.02 INSTALLATION:

A. Provide a complete installation including all Materials and Equipment necessary for Operation of the Equipment. Place all specified Equipment into operation, including machinery lubrication.
B. Install hoist and trolley level and in alignment.
C. Adjust Equipment to operate properly, including adjustment of stops to prevent overtravel, and tension to prevent travel when not in use.
D. Touch-up damaged paint surfaces with matching paint system same as used in the shop.
E. Lubricate all bearings, gears, and other items requiring lubrication before placing crane in operation.

3.03 TESTING:

A. Prior to initial use and as needed at other intervals until date of acceptance, test operate and load test crane as required by Occupational Safety and Health Administration Part 1910.179.
1. Contractor to coordinate this with the demolition schedule. Testing will be most efficient once demolition has occurred.
2. Provide Engineer one weeks' notice of the load test.
B. Perform annual inspection of new hoist.
C. Send copies of test report to Architect and Owner and place on file at Project Site.
1. Testing shall be performed by Contractor or under direction of authorized persons.

END OF SECTION 41 22 00

SECTION 43 11 33 - POSITIVE DISPLACEMENT BLOWERS

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the following:
   1. Positive Displacement Blowers and accessories including:
      a. Inlet Air Filter / Silencers.
      b. Inlet and Discharge Silencers.
      c. Sound Attenuating Enclosures with instrumentation and components specified herein.
   2. Granular Sludge Biological Treatment System (Series 400) Blowers:
      a. Five (5) blowers shall be provided by Equipment Supplier providing equipment specified under Section 46 53 60 Granular Sludge Biological Treatment System. Blowers shall meet specifications herein.
   3. Thin Sludge Tanks (Series 700) Blowers:
      a. Three (3) blowers shall be provided as specified herein.

B. Furnish all labor, equipment, and material for complete and proper installation, testing, and start-up of all blowers and accessories. Disconnect switch, power and control field wiring from and to blower skid shall be provided by others.

C. Related Work Specified Elsewhere:
   1. SECTION 46 05 13 - Common Motor Requirements for Water and Wastewater Equipment.

1.02 REFERENCES:

A. American National Standards Institute (ANSI):
   1. B16.1 - Cast-Iron Pipe Flanges and Flanged Fittings (Class 125).
   2. B16.5 – Pipe Flanges and Flanged Fittings.

B. American Gear Manufacturer's Association (AGMA).

C. American Society of Mechanical Engineers (ASME).

D. Antifriction Bearing Manufacturer's Association (AFBMA):
   1. 9-Load Rating and Fatigue Life for Ball Bearings.

E. Antifriction Bearing Manufacturer's Association (AFBMA):
   1. MG-1 - Motors and Generators.

F. International Organization for Standardization (ISO):
   1. 1217 – Displacement Compressors – Acceptance Tests.

G. National Electrical Code (NEC).

H. National Electrical Manufacturer’s Association (NEMA).

I. National Fire Protection Association (NFPA).

1.03 QUALITY ASSURANCE:

A. Blower shall be sized such that the specified speed of operation at the specified conditions does not exceed 95% of the maximum blower design speed set forth by the manufacturer.

B. Factory test all units with all components installed through full range with all data documented.
   1. Factory performance testing per ISO 1217.

1.04 SUBMITTALS:

A. Submit as specified in DIVISION 01.

B. Includes, but not limited to, the following:

1. Equipment Submittals.
   a. Submit performance test data for blower and motor according to the site conditions specified in SECTION 01810 Project Design Criteria.
   b. Submit power and control schematic diagrams indicating factory and field wiring. All diagrams shall be complete and have uniquely numbered terminals, wires and devices.
   c. Submit manufacturer's rating, performance data for the blower and accessories.
2. Test Reports
   a. Prepare and submit a bound logbook recording all running tests and time including duration of tests and all malfunctions and corrections. List causes and adjustments of blower, motor, or connected accessories.
   b. The indicated capacities at the listed conditions shall be at or above the minimum acceptable efficiency. The blower selected shall meet the design criteria while operating at or near its mid-range capabilities to ensure the equipment is not undersized for its application.
   c. Submit complete motor nameplate data and motor information as indicated in SECTION 46 05 13.
3. Closeout Submittals
   a. Submit manufacturer's rating, performance data for all blower accessories.
   b. Before completion of installation and successful start-up, submit complete operation and maintenance manual for blowers and accessories.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Aerzen.
B. Gardner-Denver.
C. Kaeser
D. Universal Blower
E. Atlas Copco

2.02 POSITIVE DISPLACEMENT BLOWERS:

A. Table 1: Design Criteria

Service	QTY	Tags	Motor HP	SCFM	Discharge Pressure (psi)*
Granular Sludge Biological Treatment System (Series 400)	5	AGS-BLOW-910 AGS-BLOW-920 AGS-BLOW-930 AGS-BLOW-940 AGS-BLOW-950	200	2,430	10.9
Thin Sludge Tanks (Series 700)	3	WAS-BLOW-410, WAS-BLOW-420 WAS-BLOW-430	100	1,200	11.5

C. Blowers: Provide positive displacement rotary-lobe type blower and all specified accessories and controls assembled into a blower package.
   1. Quantity and capacity: refer to Table 1.

D. The discharge pressure shall be as indicated in Table 1 plus additional pressure required to overcome losses in the manufacturer blower package system at the following inlet conditions:
   a. Elevation: 872.00 feet above sea level.
   2. The discharge pressure does not include pressure loss through the blower intake filter, silencer, discharge check valve, and other appurtenances. The blower manufacturer shall be responsible for these losses in determining the discharge pressure at the blower. Refer to SECTION 01810 Project Design Criteria for inlet air conditions.
   3. Each blower shall have two dynamically balanced three-lobe, low pulsation rotors constructed of high-strength cast iron.
   4. Blower casings shall be one piece with separate head plates and shall be made of close-grained cast iron. The casings shall be suitably ribbed for maximum strength and to prevent distortion under the operating conditions. Inlet and outlet connections shall be flanged.
   5. Timing gears shall be helical type or spur gear, forged and heat treated with a minimum AGMA quality rating of 10.

E. All bearings shall be oil-splash lubricated from an oil-tight housing. Oil level sight glasses shall be provided.

F. Blower operating speed at the stated conditions shall not exceed 4,000 rpm.
   1. Blower noise rating at the stated conditions shall not exceed 80 dBA at 3 feet from the enclosure.

G. Construction:
   1. The blower and associated motor shall be mounted on a rigid adjustable motor base or an automatic belt tensioner.
   2. Blower shall be designed for continuous service providing specified pressure while operating without internal rotor contact.

H. Electric Motor:
   1. The motor shall be horizontal, TEFC, 460/3/60 in accordance with SECTION 46 05 13.
   2. The blower manufacturer shall provide the electric motor on the blower skid.
   3. Motor shall be designed for operation with variable frequency drive.
   4. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
   5. Provide factory installed, maintenance free, circumferential, conductive micro fiber shaft grounding ring to discharge shaft currents to ground.
   6. Provide motor with service factor of 1.15.
   7. Belt drive shall be sized for 140% rated horsepower of the blower and shall include a drive guard.
   8. Belts shall be automatically tensioned by use of pivoting swing frame motor base with adjustable spring assistance and visual indication of belt tension.
   9. The blower will be driven by a variable frequency drive by Others.

I. Accessories: Provide for the blower accessories as indicated in the Process and Instrumentation Diagrams (P&IDs) and as follows:
   1. Flanged Intake Connections:
      a. Series 400 Blowers: Furnish 12" , ASME B16.5, 150#, SCH STD carbon steel flanged connection exterior of enclosure for connection of air piping. All piping shall be properly supported from the inlet connection.

b. Series 700 Blowers: Furnish 10" , ASME B16.5, 150#, SCH STD carbon steel flanged connection exterior of enclosure for connection of air piping. All piping shall be properly supported from the inlet connection.

2. Flanged Discharge Connections:
   a. Series 400 Blowers: Furnish flanged expansion joint with 10" ASME B16.4, 150# flanged connection outside of enclosure for connection of air piping.
   b. Series 700 Blowers: Furnish flanged expansion joint with 8" ASME B16.4, 150# flanged connection outside of enclosure for connection of air piping.
   c. Expansion joints shall be rated for maximum anticipated discharge temperature with a 25 degree F safety factor.
3. Refer to Section 40 70 00 for all instrument requirements as indicated and specified herein.
4. Inlet and Discharge Silencers: Provide silencers designed for silencing at the design blower speed. The silencers shall be of the wear-free absorptive type absorption type with matching flanges and shall be of all welded steel construction.
5. Inlet Air Filter: Each blower enclosure shall be provided with an inlet filter sized such that pressure loss through the entire filter shall not exceed 3 inches H_2O at the specified airflow with a new element. The filter shall be equipped with a pleated radial fin paper or polyester wrap element suitable for outdoor service. Each filter shall be supplied with a pressure differential switch. Filter media shall be minimum 99% efficiency at 5 micron.
6. Check Valve: Shall have cast iron or steel body, aluminum, steel, or stainless-steel internals, resilient seat capable of operating with 350°F discharge air.
7. Discharge Pressure Relief Valve: A spring type pressure relief valve shall be provided on the blower package discharge.
8. Discharge Temperature Switch: Provide a discharge temperature switch to allow blower shut down in the event of high discharge air temperature. Provide a N.C. contact that opens when the discharge temperature reaches 250 degrees F (adjustable), or as recommended by Blower manufacturer. Contacts shall be rated for 120Vac operation.
9. Blower Enclosure Inlet Filter Differential Pressure Switch: Provide a N.O. contact that closes when the differential pressure falls below the manufacturer recommended set point. Contacts shall be rated for 120Vac operation.
10. Motor shall be provided with integral thermal overload protection.
11. Pressure Instruments: A suction pressure gauge and a discharge pressure gauge (0-30 psig) shall be provided and mounted on package enclosure.
12. All interconnecting piping for unit and accessories provided within the enclosure. Vibration isolation pads made of rubber in steel footing designed to bear the weight of the entire blower package assembly without deflecting.
13. Structural steel base designed to support all operating loads and of sufficient size to hold the blower, all associated engineered accessories.
14. Spare Parts: Provide the following spare parts with the blower supplied:
    a. One spare filter element.
    b. One set spare V-belts.

J. Blower Enclosure:
1. Entire package shall be housed in an enclosure with a minimum of one removable access panel. Latches shall be weather resistant material suitable for outdoor application.
2. Provide integral ventilation fan. Ventilation capacity to maintain maximum temperature of 10°F above ambient. Fan shall be energized/de-energized via thermostat, if applicable.

a. Thermostat shall be provided, installed, and wired by manufacturer.
b. Thermostat set points per manufacturer's recommendations.
c. Thermostat contacts shall be rated for full voltage starting of the supplied fan.
d. Ventilation fan shall be powered from 120Vac and shall be fractional horsepower in size. Fan motor shall be provided with integral thermal overload protection.
(1) Blower motor shaft-mounted ventilation fan shall be acceptable in lieu of ventilation fan driven by separate circuit as long as cooling is adequate at maximum blower turndown.

3. Enclosure shall include integral, NEMA 4 junction box with terminal strips for landing all power and control wire.
4. Provide with oil drip pan if required per Supplier's package.
5. Designed to attenuate noise. Noise level 3 feet from blower enclosure shall not exceed 80 dbA.

K. Unit Base: Rigid steel frame suitable for moving with hand-operated fork-cart.
L. Factory coat assembly with manufacturer's standard coating suitable for service intended. Provide 1 quart of touch-up paint if enclosure is painted.
M. Anchor bolts
1. Contractor shall provide 316 SST anchor bolts as required for installation of equipment and of size and length as indicated on Drawing S005.
N. The blower skid shall include the manufacturer's standard means for monitoring blower pressure and temperature. Items shall be manufacturer's standard and shall include the following as a minimum:
1. Enclosure inlet air filter pressure differential, including gauge for local readout.
2. Discharge pressure, including gauge for local readout.
3. Discharge temperature, including gauge for local readout.
4. NEMA 4X high discharge temperature switch.
5. Enclosure inlet air filter differential pressure switch.
O. Intake Filter / Silencer Assemblies:
1. Series 400 Blowers: For each blower, manufacturer shall provide a dedicated intake filter / silencer assembly to be installed by Contractor on the exterior of the Blower Building.
a. Five (5) intake filter / silencer assemblies shall be provided.
b. Intake filter / silencers shall be provided with 12", ASME B16.5, 150# flanged connection. Flange shall be located on top of assembly.
c. Minimum capacity of each filter / silencer assembly shall be 5,000 cfm.
d. Filter element shall be provided with 10-micron openings.
e. Filter / silencer assembly shall be Endustra Filter Model TM09RL-E047935, or Engineer approved equal.
f. Intake Filter / Silencer Differential Pressure Switch: Provide a N.O. contact that closes when the differential pressure falls below the manufacturer recommended set point. Contacts shall be rated for 120Vac operation.
2. Series 700 Blowers: One (1) common intake filter / silencer assembly shall be provided to be installed by Contractor on a common intake pipe on the exterior of the Solids Processing Building.
a. Intake filter / silencer shall be provided with 12", ASME B16.5, 150# flanged connection. Flange shall be located on top of assembly.
b. Minimum capacity of each filter / silencer assembly shall be 5,000 cfm.
c. Filter element shall be provided with 10-micron openings.

d. Filter / silencer assembly shall be Endustra Filter Model TM09RL-E047935, or Engineer approved equal.Intake Filter / Silencer Differential Pressure Switch: Provide a N.O. contact that closes when the differential pressure falls below the manufacturer recommended set point. Contacts shall be rated for 120Vac operation.

P. Intake Filter Silencer Assemblies (Series 400 Blowers Only):
1. For each blower, manufacturer shall provide a dedicated intake silencer assembly to be installed by Contractor interior to the Blower Building. Intake silencer shall be capable of being installed in the footprint shown in the Contract Drawings.
a. Five (5) intake silencers assemblies shall be provided.
b. Intake silencers shall be provide with 12", ASME B16.5, 150# flanged connections. Inlet flanged connection shall be perpinduclar to discharge flange connections, as shown in Contract Drawings.
c. Intake silencers shall be Stoddard Silencer Model L61H-10 fabricated with 12" flanged connections.

2.03 SPARE PARTS:
A. Provide the following spare parts as a minimum:
1. One set of new and unused special tools required for installation, operation, and maintenance.
2. One (1) spare inlet air filter for each blower enclosure provided.
3. One (1) blower replacement V-belt for each blower enclosure provided.

PART 3 - EXECUTION

3.01 MANUFACTURER'S FIELD SERVICES:
A. Field services shall be provided by an experienced factory-based representative of the equipment manufacturer specializing in start-up and training, with expertise in controls capable of minor or major field adjustment of electrical, electronics, or mechanical components of blowers. Manufacturer's local sales representative is not acceptable.

3.02 INSTALLATION:
A. Install and align blower and motor in conformance with manufacturer's recommendations.
B. Make all electrical and control connections.
C. Complete all piping and supports, and install all indicated and specified gauges and instrumentation prior to start-up.
D. All aeration piping and equipment shall be installed and basin filled with water prior to start-up of the blowers.
E. Provide all necessary lubrication for initial start-up, testing and final acceptance.

3.03 PERFORMANCE TESTS:
A. Factory Performance Tests:
1. All critical dimensions of the blower components actually provided by the manufacturer shall be verified and documented prior to assembly.
2. The rotating parts of the blower actually provided by the manufacturer shall be statically and dynamically balanced before final assembly. The blower alone shall operate without vibration in excess of the limits stated in the latest revision of NEMA MG-1.

3. On completion of final assembly of the packaged blower and prior to shipment, the packaged blower shall be mechanically run for a minimum of 15 minutes at the design conditions.
4. Blower shall be tested in accordance with ISO 1217.

B. Field Performance Tests:
1. Function Test: After installation and prior to system startup, the packaged blower shall be inspected by a supplier's representative for proper alignment, proper connection, and proper function by means of a startup check.
2. Performance Test: The Supplier's manufacturer's representative shall be present and shall direct start-up, perform all checks, and shall perform tests to demonstrate that the packaged blower conforms to the Specifications to the satisfaction of the Engineer. Blower performance shall be documented by obtaining concurrent readings showing supply voltage, motor amperage, blower speed, blower inlet pressure, blower outlet pressure, blower inlet temperature, and blower outlet temperature. The packaged blower motor lead shall be checked for proper current balance.
3. Blower shall operate at rated capacity for 4 continuous hours. Blower will then be run at 30 minutes on at rated capacity and 10 minutes off for a period of 4 hours.
4. Packaged blower failing to meet the Specifications to the satisfaction of the Engineer will be corrected and retested by the installing Contractor. If a packaged blower fails the second test, the unit will be rejected and the Supplier shall furnish a unit which will perform as specified at no additional cost to the Owner.
5. A test log shall be submitted to the Engineer on completion of each test which records the blower model number, blower serial number, test date, beginning test time, ending test time, motor horsepower, motor speed, and all of the performance documentation parameters specified in this Section.

3.04 TRAINING:

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate and maintain blowers. Training shall be for a minimum of four hours, on-site, at a time mutually agreed upon by Owner and service representative. Two complete training sessions shall be provided. The Owners, at their option, shall be allowed to video record all training sessions for future reference. Training shall occur after blower installation is complete. Contractor shall coordinate with Client and blower Manufacturer.

END OF SECTION 43 11 33

SECTION 43 23 57 – PROGRESSIVE CAVITY PUMPS

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the supply, delivery, installation, and commissioning of progressive cavity pump units, including:
   1. Two (2) variable speed progressive cavity Thickened Sludge Pumps.
   2. Two (2) constant speed progressive cavity Sludge Loadout Pumps.

B. Contractor shall supply all equipment, materials, and labor required for the installation and operation of the pumping units.

C. The Thickened Sludge Pumps will be used to pump thickened sludge from the Rotary Drum Thickener sludge hopper to the Thickened Sludge Storage Tanks.

D. The Sludge Loadout Pumps will be used to pump thickened sludge from the Thickened Sludge Storage Tanks to trucks for haul off.

E. Pumps shall be furnished complete with pump casings, suction connections, discharge connections, shafts, bearings, rotor, stator, seals, lubrication, anchor bolts, motors, speed reducers, and all other parts and accessories indicated, specified, or required for proper installation, operation, and maintenance.

1.04 SUBMITTALS:

A. Submit as specified in Division 1.

B. Compliance submittals: Data to be submitted shall include, but not be limited to, the following:
   1. Catalog data or illustrations showing principal parts and materials.
   2. Detailed layout dimensions.
   3. Protective coating system.
   4. Mechanical Details:
      a. Suction nozzle diameter.
      b. Discharge nozzle diameter.
      c. Joint or drive shaft design.
      d. Type of bearings.
      e. Bearing manufacturer and design life.
      f. Provisions for removing rotor and stator assembly and changing bearings, including clearance requirements from adjacent objects and obstructions.
   5. Support Details, Base Plate:
      a. Materials.
      b. Drawing indicating configuration, minimum thickness of members, stiffeners, method of supporting pump and motor, provisions for adjusting alignment and removing motor, stator, or rotor.
   6. Dimensions:
      a. Outline drawings of pump, drivers and base.
      b. Minimum clearance dimensions for rotor removal.
   7. Weights:
      a. Total each unit.
      b. Pump (with rotating assembly).
      c. Rotating assembly.
      d. Base plate.
      e. Removable section of casing.
      f. Motor and speed reducer.
   8. Accessories (type and manufacturer):
      a. Seal.
      b. Fittings.
      c. Dry-run protection device or temperature sensor monitoring and alarming devices
      d. Thickened Sludge Pumps discharge pressure monitoring and alarming devices
      e. Sludge Loadout Pumps suction and discharge pressure monitoring and alarming devices.
   9. Motor data including, but not limited to, the following:
      a. Manufacturer's name and serial number.
      b. Horsepower output.
      c. Temperature rise and method indicated.
      d. Maximum ambient temperature.
      e. Altitude rating, including any necessary derating
      f. Insulation class.

g. Rpm at rated load.
h. Frequency.
i. Number of phases.
j. Voltage.
k. Rated load amperes.
l. Locked rotor amperes or code letter.
m. Service factor.
n. Maximum noise level of pump/motor unit (dBA).
o. Efficiency, determined in accordance with IEEE Standard 112, Method B.
p. Dimensions for enclosure and shafts.
q. Weight.
r. Bearing information.

10. Standard performance curves for each pump model furnished. Curves shall cover range from shutoff to 120% of design flow rate at the conditions specified, and shall be submitted for the following parameters as a function of pump capacity, speed and TDH at design temperature:
    a. Total developed head.
    b. Required brake horsepower.
    c. Pump efficiency.
    d. Required NPSH.
    e. Minimum flow.
    f. Maximum recommended flow.
11. VFD performance curves for the Thickened Sludge Pumps model furnished. Curves shall include the following parameters as a function of pump capacity and speed at design temperature:
    a. Total head.
    b. Required brake horsepower.
    c. Pump efficiency.
    d. Required NPSH.
    e. Minimum flow.
    f. Maximum recommended flow.

C. Factory Tests and Reports:
1. Perform non-witnessed tests for speed, pressure, and flow rate at operation points as necessary per HI Standard section 3.6.4 for meeting class A requirements. Include hydrostatic test per HI Standard section 3.6.5.
2. Pumps shall be tested in position as they will be installed in the field with no exceptions.
3. Certification of design points.
4. Submit a written test report and graphic representation(s) of the test results. Test report data collected and provided shall meet the minimums of Hydraulic Institute Standards.
5. Test certificates and results.
6. Perform all manufacturer's standard tests to determine the performance of the motors.
7. Submit test reports to Engineer.

D. Submit all field test data.

E. Operation and Maintenance Manual in accordance with Section 01021 – Operation and Maintenance Data.
1. Installation instructions.
2. Recommended spare parts list and list of lubricants.
3. Installation assembly, disassembly and repair instructions.

F. Certifications:
   1. Manufacturer's Certificate of proper installation and start-up.
   2. Field performance test procedures.
   3. Submit complete, signed report of results of field inspection, operation, adjustments, and tests. Include the Manufacturer's certificate that the equipment is ready for permanent operation and that nothing in installation will affect Manufacturer's warranty in any manner, or render warranty null and void.
   4. Certification of compliance with the requirements of the American Iron and Steel (AIS) provisions.

1.05 QUALITY ASSURANCE:

A. All items of equipment specified herein shall be furnished by one Manufacturer. This Manufacturer shall have the responsibility of providing the equipment, accessories, installation supervision, and testing services required to provide a functioning system.
B. Like items of equipment provided hereunder shall be the end products of one Manufacturer in order to achieve standardization for appearance, operation, maintenance, spare parts, and Manufacturer's service.
C. Manufacturer to provide specific standard factory tests and reports for each pump.
D. Contractor shall make any necessary adjustments to the suction and discharge piping shown on the Drawings based on the selected pump manufacturer at no additional cost to the Owner.

1.06 DELIVERY, STORAGE AND HANDLING:

A. Pump/motor units shall be completely shop assembled and aligned prior to shipping.
B. After completion of the specified factory tests, pumps shall be prepared for shipment with the minimum amount of disassembly, and such that no field disassembly, cleaning, or flushing is required.
C. Any components removed for shipping shall be match-marked prior to removal and shipment.
D. Equipment shall be shipped pre-assembled to the degree that is practicable.
E. Manufacturer shall provide storage instructions indicating specific requirements to protect against damage to or deterioration of components. Provide short- and long-term storage instructions.
F. Ship such that minimum field assembly is required.
G. Protect machined surfaces, electrical equipment, and bearings and glands against corrosion and moisture.
H. All parts shall be properly protected so that no damage deterioration will occur during a prolonged delay from the time of shipment until installation is completed and the units and equipment are ready for operation.
I. All equipment and parts must be properly protected against any damage during a prolonged period at the site.
J. Factory assembled parts and components shall not be dismantled for shipment unless permission is received in writing from the Owner.
K. Finished surfaces of all exposed pump openings shall be protected by wooden blanks, strongly built, and securely bolted thereto.
L. After hydrostatic or other tests, all entrapped water shall be drained prior to shipment, and proper care shall be taken to protect parts from the entrance of water during shipment, storage, and handling.
M. Each box or package shall be properly marked to show its net weight in addition to its contents.

N. Spare parts shall be packed in containers bearing packing lists clearly designating contents and pieces of equipment for which they are intended.

1.07 WARRANTY:

A. The warranty shall comply with the requirements of Section 01020 – Record Documents.
B. The manufacturer shall warrant that all Equipment shall be free of defects caused by faulty material or workmanship and shall replace those parts for at least a period of one (1) year from the date of start-up. Warranty shall not be prorated.
C. Multiple warranties for individual components shall not be acceptable.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Seepex, Inc.
B. Netzsch
C. Moyno

2.02 GENERAL

A. Furnish, install, and place into successful operation the Thickened Sludge Pumps and Sludge Loadout Pumps as described herein.
B. All equipment shall be designed and built for 24-hour continuous service at any and all points within the specified range of operation, without overheating, without cavitation, and without excessive vibration or strain.
C. Pumps must have design option to integrate a dry running protection temperature sensor in the rotor case to protect against extended periods of dry running.
D. The pumping units required under this section shall be complete. All parts shall be so designed and proportioned as to have adequate strength, stability, and stiffness and to be especially adapted for sludge pumping. Ample room for inspection repairs and adjustment shall be provided.
E. All working parts of the pumps and motors, such as bearings, wearing rings, shaft, and sleeves shall be standard dimensions built to limit gauges or formed to templates, such that parts will be interchangeable between like units and such that the Owner may, at any time in the future, obtain replacement and repair parts for those furnished in the original machines.
F. Mechanical equipment, including drives and electric motors shall be supplied and installed in accordance with applicable OSHA regulations. Guards shall be installed on all rotation assemblies. The noise level of motors, unless otherwise noted, shall not exceed 75 dBA measured 3 feet from the unit.
G. All lubrication fittings shall be brought to the outside of all equipment so that they are readily accessible from the outside without the necessity of removing covers, plates, housings, or guards.

2.03 THICKENED SLUDGE PUMPS DESIGN REQUIREMENTS:

A. Pumps shall perform under conditions as indicated.
B. There shall be no significant change in vibration and noise level over the entire listed range of operating conditions of the pumping system.
C. Motor sizing shall provide a minimum of 20% reserve HP as evidenced by specific requirements at maximum design condition on the certified performance curve.
D. Thickened Sludge Pumps will be speed-controlled with VFDs.
E. Thickened Solids Pumps and solids characteristics are as follows:

1.	No. of Units:	2
2.	Pump Capacity:	20-100 gpm
3.	Design Head:	90 psi
4.	Solids Handling Capacity:	1.0” sphere
5.	Maximum Pump Speed:	300 rpm
6.	Sludge Concentration:	4% min - 8% max
7.	Sludge Temperature:	32°F – 100°F
8.	Maximum Motor Speed:	1800 rpm
9.	Maximum Motor Horsepower:	15 hp
10.	Discharge Size:	4 inches
11.	Suction Size:	6 inches
12.	Number of Stages:	2
13.	Motor Mount Position	Direct Drive

2.04 SLUDGE LOADOUT PUMPS:

A. Pumps shall perform under conditions as indicated.

B. There shall be no significant change in vibration and noise level over the entire listed range of operating conditions of the pumping system.

C. Motor sizing shall provide a minimum of 20% reserve HP as evidenced by specific requirements at maximum design condition on the certified performance curve.

D. The Sludge Loadout Pumps will be constant-speed.

E. Sludge loadout Pumps and solids characteristics are as follows:

1.	No. of Units:	2
2.	Pump Capacity:	400 gpm
3.	Design Head:	50 psi
4.	Solids Handling Capacity:	1.0” sphere
5.	Maximum Pump Speed:	250 rpm
6.	Solids Concentration:	4% min - 8% max
7.	Solids Temperature:	32°F – 100°F
8.	Maximum Motor Speed:	1800 rpm
9.	Maximum Motor Horsepower:	40 hp
10.	Discharge Size:	8 inches
11.	Suction Size:	10 inches
12.	Number of Stages:	1
13.	Motor Mount Position:	Direct Drive

2.05 DRIVE UNITS:

A. Direct Drives:

1. Gear motors or gear reducers shall be designed in accordance with AGMA 6019-E (Class II). Motors shall be inverter-duty for variable speed operation using variable frequency drives for the thickened sludge pumps and constant speed for the sludge loadout pumps.
2. The gear reducer shall be sized for a minimum service factor of 1.5 and designed with a thrust load capability of 150 percent of the actual thrust load.
3. The gear motor reduction ratio shall be that required to operate the pump at its maximum operating speed when the motor is operating at its nominal rated full speed of 60 Hz.

2.06 MATERIALS AND CONSTRUCTION:

A. General:

1. Two-stage, progressive cavity type for the Thickened Sludge Pumps and single-stage progressive cavity type for Sludge Loadout pumps.
2. Suction location shall be as indicated on contract drawings.
3. Capable of withstanding high torque caused by across-the-line starting of motor.
4. Complete units, including motor, belt drive or gear-motor, and pump unit mounted on a common base plate.
5. Designed to permit complete removal of the stator tube without removing the discharge isolation valve.

B. Casings:
1. Mechanite or similar cast iron.
2. Casings shall not have been repaired by plugging, welding or other methods.
3. Provide hand holes on each side of the suction housing.
4. There shall be a top inspection cover to allow for inspection of rotor joint and clean out suction body.
5. The casing shall have multiple ¾" FNPT connections (Min 4) for vents, drains, and gauges. The connections shall be at the highest and lowest point of the housing regardless of suction orientation.
6. The suction and discharge connections shall be ANSI/B16.1 flanges sized for the pump specified. The discharge flange shall have a vent/gauge connection that can be rotated in 90 increments.
7. The pump housing shall be constructed as such to allow for easy access to both joints without having to disconnect piping or removing most of the housing.

C. Suction and discharge connections shall be ANSI, Class 125, flat face flanges unless otherwise specified.

D. Helical Rotor:
1. Rotor shall be constructed of chrome tool steel with Brinnell hardness not less than 550 or ASTM A331-90, grade 4150 or 4150 cold finish alloy steel with a hard chrome plate and a minimum thickness of 0.010 inches.
2. The removal of the rotor shall not require any disconnection of the suction or discharge piping. Pump shall be full service in place. Deviations or special adaptors are not allowed.

E. Stator:
1. Buna-N synthetic rubber, shore "A" durometer 65.5.
2. Enclosed in a steel pipe sleeve with a seal integral to the stator elastomer preventing the metal pipe sleeve from contacting the pumped liquid.
3. The removal of the stator shall not require any disconnection of the suction or discharge piping. Stators shall be two piece and replaceable without dismantling the pump suction or discharge flanges or any associated piping.Pump shall be full service in place. Deviations or special adaptors are not allowed.
4. Dry run protection
   a. Stator shall be fitted with a sensor sleeve and Pt-100 sensor.
   b. Controller shall be provided by Pump Supplier to continuously monitor stator temperature. Coordinate with the Contractor for installation within the associated VFD or RVSS. Temperature rise above set point shall indicate no flow condition.
   c. Field adjustable switchpoint range selected by pump manufacturer.
   d. 120 Vac supply voltage with two SPDT relays.
   e. Stand process configuration of –40 to +160 deg F.
   f. Refer to the Contract Drawings' Control Diagrams for other requirements.

F. Drive shaft:
   1. Drive shaft in seal area shall be chrome plated alloy steel, SAE 8620 or Chromium Nitride coated AISI D-6 hardened tool steel.
   2. Stainless steel shaft sleeves locked to shaft in a manner to withstand rotation in either direction and designed to prevent leakage between shaft and sleeve.
   3. Direct-coupled units shall be equipped with a plug-in drive shaft such that either the driven-end or the wet-end of the pump can be serviced without complete disassembly of the pumping unit. Coupling members shall be secured with coupling rod pins and retaining sleeves enclosed in an elastomeric universal joint sleeve.

G. Connecting Rod
   1. Cold-rolled carbon steel, SAE 316SS or SAE 420SS unless otherwise specified.
   2. Connections on connecting rod shall be universal gear type joints or positively sealed and lubricated pin joint. Universal joints shall be of alloy steel, SAE 8620, or air-hardened tool steel of 57-60 HRc. The joints shall include the warranty specified in Paragraph 1.05 regardless of the type of joint provided.
   3. The connecting rod shall be two piece design to allow for the rotor and stator to be removed from the suction housing together either up or off to the side. Horizontal removal is not acceptable. Disassembly of a joint is not acceptable.

H. Bearings:
   1. Renewable, grease lubricated anti-friction type.
   2. Design conforms to AFBMA Standards.
   3. Rated minimum life at least 50,000 hours B-10 when operated continuously at maximum design rpm and sustaining all normal loads to be incurred by this application.
   4. Thrust bearings capable of taking radial load and total thrust loads of rotating assembly and which may be imposed in either direction by flexible couplings and any unbalanced hydraulic loads and loading produced by vertical mounting.
   5. Radial bearings capable of taking maximum radial loads. Protected from dirt and moisture with devices proven capable of positive protection both while pump is running and idle.

I. Mechanical Seals:
   1. Cartridge type mechanical seals shall be provided for each pump with seal materials specified. The use of non-cartridge type mechanical seals will not be accepted.
   2. The rotating and static seal faces must be abrasive resistant silicon carbide to silicon carbide seal surfaces, with FPM elastomer.
   3. Each shaft seal must have flushing connections for grease or oil lubrication.
   4. Shaft seals must be front loading. Designs requiring the removal of the rotor case for seal replacement will not be acceptable.

J. Base Plate:
   1. Each complete pumping unit mounted on a common base plate.
   2. Continuous-box type of cast iron or steel construction, presenting a pleasing appearance, and adequately braced and reinforced so that minimum distortion will develop during shipment or erection.
   3. An adequate number of holes provided in top for placement and compaction of grout. Provide sufficient vent holes to eliminate voids in grouting.
   4. Drip base and drain connection with drain lines:
      a. 19 mm (3/4-inch) type L hard temper copper tubing.

2.07 MOTORS:

A. The motors shall be horizontal polyphase motors as specified in Section 46 05 13.
B. The motor shall be rated for 460 Vac, 3 phase, 60Hz operation.
C. Motor shall be designed for operation with variable frequency drive.
D. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
E. For VFD-powered motors: provide factory installed, maintenance free, circumferential, conductive micro fiber shaft grounding ring to discharge shaft currents to ground.
F. Provide motor with service factor of 1.15.
G. Manufacturer shall coordinate details of the pump, motor and drive design with particular attention to the range of flows specified and speeds required to produce such flows.

2.08 INSTRUMENTATION AND ACCESSORIES:

A. Include, with the pump and motor, the following
    1. Provide all instrumentation to protect the pumps and motor.
    2. Provide all instrumentation as specified in Section 40 70 00.
    3. Provide all instrumentation as specified on the P&IDs.
    4. Provide with skid-mounted pump junction box sized to permit connection of all control wires and shall be designed to accept the number and size of conduits indicated.
        a. Provide terminal strips for landing all control wire.
        b. Terminals shall be permanently identified.
        c. All pump instrumentation, including Pt-100 sensors and pressure switches, shall be pre-wired to pump junction box. Pt-100 wires shall be shielded and kept separate from other control wires.
        d. Epoxy coated aluminum NEMA 4 enclosure with stainless steel identification tag.
    5. Appurtenances and safety devices required for proper operation.
    6. All manuals, drawings, parts lists, and special tools required for assembly, operation, and maintenance.
    7. Lubricants necessary for start-up, testing, and one year of continuous operation.
    8. Stainless steel nameplates, with manufacturer's name and address; rated capacity; rated head; rated speed; and model number, securely attached to the pump and motor.
    9. All necessary fittings and cocks for vents and drainage.

2.09 ANCHOR BOLT ASSEMBLY:

A. Complete anchor bolt assembly (studs, nuts, washers, etc.) to be designed and provided by the manufacturer. Anchor bolt assembly must meet the requirements of Section 05 05 19 for nonlife safety anchors. Anchor material shall be 316 SST. Anchor size and embedment shall be clearly shown on the equipment drawings.

2.10 PRESSURE GAUGES, GAUGES, AND SWITCHES:

A. Provide the following for mounting to the pump suction flange for the Sludge Loadout Pumps:
    1. Vacuum Pressure Sensor: RKL Series W pressure sensor/isolator for factory filled diaphragm pressure seal, or Engineer-approved equal.
    2. Suction Vacuum Gauge: 4-inch liquid filled stainless steel case, 0 to 30 inches Hg range
    3. Pressure Switches:
        a. NEMA 4X enclosure.
        b. Snap action SPDT switch rated 4 amps at 120VAC.
        c. Operating range: 0-30 inches Hg vacuum.
        d. 4-1/2 inch diameter indicator.

e. Single set point to stop pump on excessive vacuum pressure condition. Set point shall be field adjustable.

4. Brass or stainless steel connecting nipples and fittings as necessary for factory mounting of gauge and switch to sensor.

B. Provide the following for mounting to the pump discharge flange for the Thickened Sludge Pumps and the Sludge Loadout Pumps:

1. Pressure Sensor: RKL Series W pressure sensor/isolator or ONYX PSW Iso-Ring for factory filled diaphragm pressure seal or engineer-approved equal.
2. Discharge Pressure Gauge: 4-inch liquid filled stainless steel case, 0 to 200 psig range.
3. Pressure switches:
   a. Indicating type to allow switch settings to be observed.
   b. NEMA 4X enclosure.
   c. Snap action SPDT switch rated 4 amps at 120 VAC.
   d. Operating range: 0 to 200 psig.
   e. 4-1/2 inch diameter indicator.
   f. Single set point control to stop the pump on high pressure conditions. Set point shall be field adjustable.
4. Brass or stainless steel connecting nipples and fittings as necessary for factory mounting of gauge and switch to sensor.

2.11 PROTECTIVE COATINGS:

A. Shop Painting:

1. Manufacturer shall prepare surfaces, prime and finish paint all iron and steel surfaces with manufacturer's standard coating system suitable for service intended (corrosive environment).
2. All stainless steel surfaces shall not be painted.

B. Field Painting:

1. Contractor shall touch up coatings damaged during shipment or installation.
2. Pump manufacturer shall furnish Contractor with an adequate quantity of touch-up paint.

2.12 SPARE PARTS:

A. One (1) set for each pump. Each set shall be packed in wooden containers labeled to show contents.

B. Each set shall include the following:

1. Set of universal joints.
2. Mechanical Seal.
3. Gaskets.
4. Stator.
5. Rotor
6. One complete set of any special tools required to dismantle pump.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General:

1. Installation, start-up and testing of all equipment and associated construction shall conform to manufacturer's recommendations. Manufacturer's field services shall be provided as specified in Division 1.

2. Manufacturer's representative shall be on site for start-up and testing and shall supervise installation. Provide manufacturer's start-up services for progressive cavity pump and variable frequency drives. Contractor shall provide additional manufacturer's services for troubleshooting and to correct deficiencies as required.
3. Manufacturer's representative shall provide a minimum of four (4) hours training in operation and maintenance for Owner's personnel.
4. Provide all necessary lubricants for initial start-up and testing or as required for final acceptance. The grades of oil and grease and anchor bolts shall be in accordance with manufacturer's recommendations.
5. Lubricate all bearings, gears and items requiring lubrication before placing equipment in operation.

B. Pumping Units:
1. Do not grout base plates until units are in complete alignment.
2. Install pipe, valves, supports, and accessories to minimize stresses being placed on pump nozzles.
3. Connect stuffing box drains to floor drains adjacent to equipment pads.

3.02 MANUFACTURER'S FIELD SERVICES:

A. Field services shall be provided by an experienced factory-based representative of the equipment manufacturer specializing in start-up and training, with expertise in controls capable of minor or major field adjustment of electrical, electronics, or mechanical components of blowers. Manufacturer's local sales representative is not acceptable.

B. Manufacturer shall be present for a minimum of two person-days for installation assistance, inspection, testing and certification of installation.

3.03 FIELD QUALITY CONTROL:

A. Performance Tests:
1. Provide a minimum of two (2) days of services for startup and training.
2. Equipment Tests:
a. Check performance of all components as a functioning unit.
b. Verify conformance with specifications as well as possible with facilities available at the site of installation.
(1) Conduct all tests in the presence of authorized representatives of Owner and Engineer.
(2) Vibration Analysis and limits; pump and drive unit:
(a) Vibration velocity shall be measured at centerline of pump and in all planes.
(b) Maximum velocity, in inches per second, shall not exceed 0.12.
(c) If velocity exceeds that specified the defect shall be corrected at no expense to the Owner.
(d) Conduct all tests in the presence of authorized representatives of Owner and Engineer.
(e) Conduct tests at maximum pump rpm.

B. Operational Tests:
1. Conduct operational test as necessary to determine that the performance of equipment and controls is as specified.
2. Tests will generally consist of placing equipment in operation under varying conditions and observing performance. Provide tachometer to confirm rotational speed. Confirm

flow rates using the sludge flow meter at varying discharge pressures using pressure gauge and throttling discharge valve.

C. Submit copy of results of tests to Owner with copy to Engineer after the completion of the testing.

3.04 MANUFACTURER'S FIELD SERVICE:

A. As specified in DIVISION 01 and as follows:

B. The equipment suppliers shall furnish the services of a factory-trained representative on site for a period of no less than 4 days (two visits). The representative shall inspect, adjust, calibrate and place into operation the system, then train Owner operating personnel in its use for a minimum of two sessions, two hours each. If additional services are required to produce a fully operational system, they shall be provided at no cost to the Owner.

C. After installation and after all equipment and components are in operable condition, a field mechanical and electrical performance test shall be performed in the presence of the Engineer.
   1. Each piece of equipment shall be tested for normal start, stop, and emergency stop cycles.
   2. Each piece of equipment shall be field tested and the equipment calibrated to demonstrate to the Engineer that all equipment will satisfactorily perform the functions and criteria specified.
   3. Furnish test forms and procedures for field testing and provide all test apparatus required at no additional cost to the Owner.
   4. Follow testing procedures recommended by the equipment manufacturer and approved by the Engineer.
   5. The equipment supplier shall modify or replace any equipment necessary to obtain satisfactory performance.

D. Manufacturer shall certify in writing that all equipment has been properly installed, tested, and are operating satisfactorily prior to initial start-up. Submit a written report to Owner with copy to Engineer in letter form showing operations performed and results obtained. Submit as specified in DIVISION 01.

E. All labor, materials, and test apparatus necessary for conducting the above tests shall be furnished by the Contractor at no additional cost to the Owner, unless stated otherwise.

END OF SECTION 43 23 57

SECTION 43 23 58 – ROTARY LOBE PUMPS

PART 1 - GENERAL

1.01 SUMMARY:

A. This section includes all labor, materials, equipment, and incidentals required for delivery to the project site ready for installation, rotary lobe pump units, including:
   1. Three (3) variable speed Thin Sludge Pumps.

B. Contractor shall supply all equipment, materials, and labor required for the installation and operation of the pumping units.

C. The Thin Sludge Pumps will transfer municipal waste activated sludge generated from aerobic granule sludge process from the thin sludge tanks to the rotary drum thickeners.

1.02 RELATED REQUIREMENTS:

A. Division 1 – General Requirements.

B. Division 9 – Protective Coatings.

C. Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment.

1.03 REFERENCE STANDARDS:

A. American Iron and Steel Institute (AISI).

B. American National Standards Institute (ANSI):
   1. B16.5 Class 150 Pipe Flanges.

C. Standards of the Hydraulic Institute (HI).

D. Institute of Electrical and Electronics Engineers (IEEE).

E. National Electrical Code (NEC).

F. National Electrical Manufacturers Association (NEMA).

G. Occupational Safety and Health Administration (OSHA).

1.04 SUBMITTALS:

A. Submit in accordance with requirements in Division 1.

B. Copies of all materials required establishing compliance with the specifications shall be submitted and shall include, but not be limited to the following:
   1. Certified shop and erection drawings showing all, important details of construction, dimensions, and anchor bolt locations.
   2. Descriptive literature, bulletins and/or catalogs of the equipment.
   3. Data on the characteristics and performance of each pump. Data shall include guaranteed performance curves, based on actual shop tests of similar units, which show that they meet the specified requirements for head, capacity, and horsepower. Curves shall be submitted on 8.5 in by 11 in sheets, at as large a scale as is practical. Catalog sheets showing a family of curves will not be acceptable.
   4. Standard and VFD performance curves for each pump model furnished. Curves shall include the following parameters as a function of pump capacity and speed at design temperature:
      a. Total head.
      b. Required brake horsepower.
      c. Pump efficiency.
      d. Required NPSH.
      e. Minimum flow.
      f. Maximum recommended flow.

g. Capacity curves showing anticipated lobe wear durations for design RPM and resulting decreased flow output.

5. Mechanical details including lobes, bearings, couplings and seals.
6. Submit layout, dimensional and cross-section drawings.
7. Manufacturer's standard protective coating system.
8. Motor performance data and results of shop test.
9. Pump nameplate data.
10. Motor nameplate data.
11. Weights.
12. Copies of all tests results, as specified.
13. A complete total bill of materials of all equipment (may be furnished with Operation and Maintenance manuals).
14. A list of the manufacturer's recommended spare parts shall be supplied. Include gaskets, packing, etc. on the list. List bearings by the bearings manufacturer's numbers only.
15. Complete motor and control systems data.

C. Factory Tests and Reports:
1. Perform non-witnessed tests for speed, pressure, and flow rate at operation points as necessary per HI Standard section 3.6.4 for meeting class A requirements. Include hydrostatic test per HI Standard section 3.6.5.
2. Pumps shall be tested in position as they will be installed in the field with no exceptions.
3. Certification of design points.
4. Submit a written test report and graphic representation(s) of the test results. Test report data collected and provided shall meet the minimums of Hydraulic Institute Standards.
5. Test certificates and results.
6. Perform all manufacturer's standard tests to determine the performance of the motors.
7. Submit test reports to Engineer.

D. Operation and Maintenance Manual includes, but not limited to, the following:
1. Special shipping, storage, protection, and handling instructions including dimensions of each container or package shipped.
2. Recommended unloading method at project site including implement (e.g., forklift, etc.) and maximum container or package weight.
3. Manufacturer’s printed installation instructions.
4. The manual shall be prepared specifically for this installation and shall include all required cuts, drawings, wiring diagrams, equipment lists, descriptions, etc. that are required to instruct operating and maintenance personnel unfamiliar with such equipment. The maintenance instructions shall include trouble shooting data, full preventative maintenance schedule and complete spare parts lists with order information. In addition the manuals shall include the following at a minimum:
a. Complete parts list cross-referenced to an exploded view assembly or equivalent drawing.
b. Dimensional drawings of all provided equipment with component weights.
c. Complete preventative maintenance procedures (including recommended intervals).

E. Certifications:
1. Manufacturer’s Certificate of proper installation and start-up.
2. Field performance test procedures.

3. Submit complete, signed report of results of field inspection, operation, adjustments, and tests. Include the Manufacturer's certificate that the equipment is ready for permanent operation and that nothing in installation will affect Manufacturer's warranty in any manner, or render warranty null and void.
4. Certification of compliance with the requirements of the American Iron and Steel (AIS) provisions.

1.05 QUALITY ASSURANCE:

A. All items of equipment specified herein shall be furnished by one Manufacturer. This Manufacturer shall have the responsibility of providing the equipment, accessories, installation supervision, and testing services required to provide a functioning system.
B. Like items of equipment provided hereunder shall be the end products of one Manufacturer in order to achieve standardization for appearance, operation, maintenance, spare parts, and Manufacturer's service.
C. Manufacturer to provide specific standard factory tests and reports for each pump.
D. Contractor shall make any necessary adjustments to the suction and discharge piping shown on the Drawings based on the selected pump manufacturer at no additional cost to the Owner.

1.06 DELIVERY, STORAGE, AND HANDLING:

A. Equipment shall be shipped pre-assembled to the degree that is practicable.
B. Manufacturer shall provide storage instructions indicating specific requirements to protect against damage to or deterioration of components. Provide short- and long-term storage instructions.
C. Seal all openings for shipment as follows:
   1. Cover flanged connections with plywood bolted to the flange with not less than four bolts.
   2. Plug or cap all screwed connections with standard pipe plugs or caps.
D. Ship such that minimum field assembly is required.
E. Protect machined surfaces, electrical equipment, and bearings and glands against corrosion and moisture.
F. All parts shall be properly protected so that no damage deterioration will occur during a prolonged delay from the time of shipment until installation is completed and the units and equipment are ready for operation.
G. All equipment and parts must be properly protected against any damage during a prolonged period at the site.
H. Factory assembled parts and components shall not be dismantled for shipment unless permission is received in writing from the Owner.
I. Finished surfaces of all exposed pump openings shall be protected by wooden blanks, strongly built, and securely bolted thereto.
J. After hydrostatic or other tests, all entrapped water shall be drained prior to shipment, and proper care shall be taken to protect parts from the entrance of water during shipment, storage, and handling.
K. Each box or package shall be properly marked to show its net weight in addition to its contents.
L. Spare parts shall be packed in containers bearing packing lists clearly designating contents and pieces of equipment for which they are intended.

1.07 WARRANTY:

A. The warranty shall comply with the requirements of Section 01020 – Record Documents

B. All equipment supplied under this section shall be warranted for a period of one (1) years from startup.
C. The equipment shall be warranted to be free from defects in workmanship, design, and materials. This warranty shall include, but not be limited too mechanical seals, wear plates, housing segments, and lobes. If any part of the equipment should fail during the warranty period, it shall be replaced in the machine and the unit restored to service at no expense to the Owner.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Boerger.
B. Netzsch.
C. Vogelsang

2.02 GENERAL:

A. Furnish, install, and place into successful operation rotary lobe positive displacement pumps as described herein.
B. All equipment shall be designed and built for 24-hour continuous service at any and all points within the specified range of operation, without overheating, without cavitation, and without excessive vibration or strain.
C. Pumps must have design option to integrate a dry running protection temperature sensor in the rotor case to protect against extended periods of dry running.
D. The pumping units required under this section shall be complete. All parts shall be so designed and proportioned as to have adequate strength, stability, and stiffness and to be especially adapted for sludge pumping. Ample room for inspection repairs and adjustment shall be provided.
E. All working parts of the pumps and motors, such as bearings, wearing rings, shaft, and sleeves shall be standard dimensions built to limit gauges or formed to templates, such that parts will be interchangeable between like units and such that the Owner may, at any time in the future, obtain replacement and repair parts for those furnished in the original machines.
F. Mechanical equipment, including drives and electric motors shall be supplied and installed in accordance with applicable OSHA regulations. Guards shall be installed on all rotation assemblies. The noise level of motors, unless otherwise noted, shall not exceed 75 dBA measured 3 feet from the unit.
G. All lubrication fittings shall be brought to the outside of all equipment so that they are readily accessible from the outside without the necessity of removing covers, plates, housings, or guards.

2.03 THIN SLUDGE PUMPS:

A. Pumps shall perform under conditions as indicated.
B. When operating at maximum design speed, the tip speed of the rotors shall not exceed 10 feet per second, to ensure long operating life.
C. There shall be no significant change in vibration and noise level over the entire listed range of operating conditions of the pumping system.

D. Motor sizing shall provide a minimum of 20% reserve HP as evidenced by specific requirements at maximum design condition on the certified performance curve.
E. All pumps will be speed-controlled with VFDs.
F. Thin Sludge Pumps:

1.	Number of Pumps:	3
2.	Service:	Thin Sludge Pumping
3.	Maximum Motor Speed:	1,800 rpm
4.	Maximum Pump Speed:	300 rpm
5.	Maximum Motor HP:	7.5
6.	Minimum Flow:	100 gpm
7.	Maximum Flow:	250 gpm
8.	Discharge Pressure:	15 psig
9.	Total Solids:	0.5-2.0%
10.	Suction Size:	6-inch
11.	Discharge Size:	6-inch

2.04 CONSTRUCTION:

A. Each pump shall be of positive displacement rotary lobe design.
B. Pump Housing:
   1. The pump housing shall be constructed of cast iron. Suction and discharge ports shall be 150 lb ANSI flanged.
   2. Radial housing section or wear plates shall be easily removable.
   3. The front cover shall incorporate a compression fit seal for sealing between front cover and rotor case. All fasteners shall be 316 stainless steel.
   4. Pumps without replaceable radial housing sections shall provide radial wear plates. The removable wear plates shall be 40 Rockwell C AISI 4140 carbon steel wear plates that will protect against wear of the rotor case. The wear plates must be easily removable and fixed or bolted at the inlet and outlet of the rotor case.
   5. Pumps must have rear and front wear plates. The front and rear wear plates shall be easily removable and accessible.
   6. All wear items shall be constructed of hardened steel.
C. Front Cover:
   1. The pumps shall be provided with a quick release removable front cover.
   2. The front cover shall be constructed of cast iron, with a minimum Brinell hardness of 230 to 260, and permit removal of the rotors without disturbing piping, bearings, and mechanical seals.
   3. The front cover shall be machined to accept a reversible front wear plate. Pumps not equipped with a removable wear plate and use the front door for its wear surface, are not acceptable.
   4. The quick release front cover must be held with only four screws at the housing.
D. Rotors:
   1. The pump shall be fitted with a pair of intermeshing rotors with a minimum of three lobes in helical low pulse design. Designs with lobes parallel to the shaft centerline will not be accepted. The convoluted lobes shall be specifically designed for pumping wastewater sludge, including aerobically digested waste activated sludge. Pumps utilizing lobe designs with fewer than three tips will not be considered.
   2. The rotors shall consist of solid grey cast iron cores that are covered with a layer of NBR 70, Durometer hardness 65-72. The geometry of the rotor core shall be the same as that

of the finished rotor. Rotors shall be keyed to the shaft by replaceable, hardened key ways, and secured to the shaft.

3. The elastomeric coated rotors shall be guaranteed against bonding failure, otherwise known as delamination.
4. The rotors shall be end-mounted on the shafts and held precisely in the radial position to ensure positive positioning of the rotors on the shaft and precise intermeshing clearances around the rotors. The rotors shall be axially locked into position.

E. Shafts:
1. The shaft shall be constructed of high tensile carbon steel fitted with replaceable stainless steel sleeves where passing through the seal area. Sludge wetted rotor/shaft connections are not acceptable.
2. Shafts shall be synchronized in their rotation by straight cut timing gears running in a separate oil chamber which also contains the ball and roller bearings for each shaft. Pumps requiring external re-timing in the event of blockage will not be considered.
3. The bearings and timing gears shall be located in a common oil-filled cast iron gearbox, fitted with a built-in sight glass to monitor oil level. The timing gear shall maintain non-contact between the rotors and be positioned on either side of the timing gears in order to give the best shaft support.
4. The shaft shall be a minimum of 60 mm in diameter where the rotors, bearings, and mechanical seals contact the shaft, to decrease the potential of torsional shaft fatigue. The use of step down shafts will not be acceptable.
5. The shaft sleeves where the mechanical seal rides, shall be removable through the front of the pump, without the use of special tools, and without disturbing the surrounding piping.
6. Shafts shall be non-wetted at all points and sealed from the pumping liquid.

F. Mechanical Seals:
1. Cartridge type mechanical seals shall be provided for each positive displacement pump with seal materials specified. The use of non-cartridge type mechanical seals will not be accepted. Pumps that require water flush or quench will not be accepted.
2. The rotating and static seal faces must be abrasive resistant silicon carbide to silicon carbide seal surfaces, with NBR elastomer.
3. Shaft seals must be front loading. Designs requiring the removal of the rotor case for seal replacement will not be acceptable.

G. The removable end cover shall be flush with no recesses or dead pockets where solids can accumulate. The cover shall be sealed with NBR O-ring and provide complete access to the pump chamber without disconnecting pipe work glands or bearings.

H. The pump, gear reducer, and motor shall be mounted on a steel base plate complete with necessary couplings, guards, and mounting hardware.

I. Vibration: Pumps and motors shall operate at any point within their operating range without undue noise and vibration. Vibration at any point in the operating range shall not exceed the limits allowed by the Hydraulic Institute.

J. The top and bottom housing segments of the pump shall be adjustable based on wear or spares shall be provided.

2.05 MOTORS:

A. The motor shall be rated for 460 Vac, 3 phase, 60Hz operation and conform to requirements of Section 46 05 13 and herein.
B. Motor shall be constant torque rated.
C. Motor shall be designed for operation with variable frequency drive.
D. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
E. Provide factory installed, maintenance free, circumferential, conductive micro fiber shaft grounding ring to discharge shaft currents to ground.
F. Provide motor with service factor of 1.15.

2.06 INSTRUMENTATION AND ACCESSORIES:

A. Include, with the pump and motor, the following:
    1. Instrumentation shall be in accordance with Section 40 70 00.
    2. Provide with skid-mounted pump junction box sized to permit connection of all control wires and shall be designed to accept the number and size of conduits indicated.
        a. Provide terminal strips for landing all control wire.
        b. Terminals shall be permanently identified.
        c. All pump instrumentation, including Pt-100 sensors and pressure switches, shall be pre-wired to pump junction box. Pt-100 wires shall be shielded and kept separate from other control wires.
        d. Epoxy coated aluminum NEMA 4 enclosure with stainless steel identification tag.
    3. All items necessary for complete assembly including base plate and anchor bolts.
    4. Appurtenances and safety devices required for proper operation.
    5. All manuals, drawings, parts lists, and special tools required for assembly, operation, and maintenance.
    6. Lubricants necessary for start-up, testing, and one year of continuous operation.
    7. Stainless steel nameplates, with manufacturer's name and address; rated capacity; rated head; rated speed; and model number, securely attached to the pump and motor.
    8. All necessary fittings and cocks for vents and drainage.
    9. Bolts and Nuts:
        a. Type 316 stainless steel.
B. Suction Vacuum Pressure Gauge and Switch:
    1. Provide the following for mounting to the pump suction gland.
    2. Vacuum Pressure Sensor: RKL Series W pressure sensor/isolator for factory filled diaphragm pressure seal, or Engineer-approved equal.
    3. Suction Vacuum Gauge: 4-inch liquid filled stainless steel case, 0 to 30 inches Hg range
    4. Pressure Switches:
        a. NEMA 4X enclosure.
        b. Snap action SPDT switch rated 4 amps at 120VAC.
        c. Operating range: 0-30 inches Hg vacuum.
        d. 4-1/2 inch diameter indicator.
        e. Single set point to stop pump on excessive vacuum pressure condition. Set point shall be field adjustable.
    5. Brass connecting nipples and fittings as necessary for factory mounting of gauge and switch to sensor.
C. Discharge Pressure Gauges and Switch:
    1. Provide the following for mounting to the pump discharge gland.

2. Pressure Sensor: RKL Series W pressure sensor/isolator for factory filled diaphragm pressure seal, or Engineer-approved equal.
3. Discharge Pressure Gauge: 4-inch liquid filled stainless steel case, 0 to 100 psi range,
4. Pressure Switches:
   a. NEMA 4X enclosure.
   b. Snap action SPDT switch rated 4 amps at 120VAC.
   c. Operating range: 0 to 100 psi.
   d. 4-1/2 inch diameter indicator.
   e. Set point control to stop the pump on high pressure condition. Set point shall be field adjustable.
5. Brass connecting nipples and fittings as necessary for factory mounting of gauge and switch to sensor.
6. Dry run protection
   a. Stator shall be fitted with a sensor sleeve and Pt-100 sensor.
   b. Controller shall be provided by Pump Supplier to continuously monitor stator temperature. Coordinate with the Contractor for installation within the associated VFD. Temperature rise above set point shall indicate no flow condition.
   c. Field adjustable switchpoint range selected by pump manufacturer.
   d. 120 Vac supply voltage with two SPDT relays.
   e. Stand process configuration of –40 to +160 deg F.
   f. Refer to the Contract Drawings' Control Diagrams for other requirements.

2.07 FINISHES:

A. Shop Painting:
   1. Manufacturer shall apply manufacturer's recommended protective coating to all carbon steel surfaces in the shop.
   2. Prepare surfaces, prime, and finish paint all iron and steel surfaces as specified in Section 09 90 00.
   3. Prepare surface of damaged and uncoated areas and touch-up as required for complete protection.
   4. All nameplates, bronze or stainless steel surfaces shall not be painted.
B. Touch Up:
   1. Prepare surfaces and touch up coatings damaged during shipment and installation.
   2. Obtain an adequate quantity of tough up paint from pump manufacturer.

2.08 TOOLS AND SPARE PARTS:

A. Include spare parts as required for the complete installation and operation of the system.
B. One set of all special tools required for normal operation, maintenance, servicing, and dismantling of the units shall be provided.
C. At a minimum, the following spare parts shall be provided:
   1. One set of cartridge mechanical seals, o-rings, and lip seals for each pump.
   2. One set of rotors, lobes and o-rings for each pump.
   3. One set of all replaceable wear components for each pump.
D. Spare Parts shall be properly bound and labeled for easy identification without opening the packaging and suitably protected for long-term storage.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Installation, start-up, and testing of all Equipment and associated construction shall conform to manufacturer's recommendations. The grades of oil and grease and anchor bolts shall be in accordance with manufacturer's recommendations.

3.02 MANUFACTURER'S FIELD SERVICES:

A. Manufacturer's field representative shall inspect Equipment after the Equipment has been installed and prior to start-up. A written report of the inspection shall be submitted to Owner.

B. Manufacturer shall be present for a minimum of two person-days for installation assistance, inspection, testing and certification of installation.

C. Training:

1. Manufacturer shall provide a means to video record all training and furnish edited electronic copies to Owner for later reference.
2. Provide a minimum of four hours of service for training of Owner's personnel.
3. Training shall include:
    a. Operation, start-up, shut-down, lock-out, emergency operating procedures, control, adjustment, maintenance, assembly, disassembly, and repair of the equipment including control sequences, identification systems, materials, spare parts, special tools, lubricants and fuels.
    b. Technical repair manual.
    c. Cleaning.
    d. Lubrication of equipment.
    e. Optimizing equipment and system performance.
    f. Capabilities of equipment and systems.
    g. Operational safety of equipment and systems.
    h. Emergency situation response of equipment and systems.

3.03 TESTING:

A. Conduct in the presence of Owner and/or Engineer.

B. Demonstrate the functional integrity of the mechanical, electrical and control interfaces of the equipment.

C. After the pumps have been completely installed and wired, the Contractor shall have the manufacturer perform the following, at a minimum:

1. Check performance of all components as a functioning unit. Conduct such operation tests as necessary to determine that the performance of equipment and controls is as specified.
2. Check alignment of each unit.
3. Megger stator and power cables.
4. Check seal lubrication.
5. Check for proper rotation.
6. Check power supply voltage.
7. Measure motor operating load and no load current.
8. Motors: Insulation (megger) test, rotational direction (bump) test and visual inspections required by NETA ATS.
9. Bump motor to check for correct rotation.
10. Noise and vibration tests shall be conducted in conformance with Hydraulic Institute Test Codes and OSHA Standards of Occupational Noise Exposure.

11. Make all necessary equipment adjustments and corrective work indicated by tests.

D. Submit a written test report to Contractor in a letter form stating operations performed and results obtained for each unit. The report should also state that the equipment has been installed properly, has been started up, and is ready for operation by Owner's personnel.

E. Operational Testing:
   1. Conduct in the presence of Owner and/or Engineer.
   2. Run pump:
      a. Record head (ft) versus flow (gpm) for each pump. Engineer shall compare results against the manufacturer's provided performance curve.
      b. If potable water is used, the Owner shall provide water at no cost to Contractor.

END OF SECTION 43 23 58

SECTION 44 31 19 – ODOR CONTROL SYSTEM

PART 1 - GENERAL

1.01 SUMMARY:

A. General:

1. This Section identifies the requirements for the odor control system for the Thickened Sludge Storage Tanks and Coarse Screening Channels. The odor control system shall run continuously and shall be designed to destroy odorous compounds within the proposed structure regardless of flows, temperature, or varying volumes of headspace in the Thickened Sludge Holding Tanks and Coarse Screening Channels.
2. The hydroxyl radical odor control system shall consume no external chemicals in its operation, nor shall there be any waste product to dispose of and there shall be no increase in total dissolved solids to the sludge or influent wastewater.

B. Scope:

1. Furnish all labor, materials, equipment and incidentals required to install odor control system for the control of atmospheric H2S, Ammonia, VOC and other noxious odors for the Coarse Screening Channels and two (2) Thickened Sludge Storage Tanks as shown on drawings and specified herein. The hydroxyl radical mist odor control system shall be an engineered system consisting of the following major components:
   a. Hydroxyl radical odor control base cabinet (outdoor rated)
   b. Blower
   c. Ozone Generator
   d. Applicable Flow Instruments, as deemed necessary.
   e. Nozzles:
      (1) Thickened Sludge Holding Tank: Six (6) HV nozzles. Three (3) per each tank.
      (2) Coarse Screening Channels: Three (3) HV nozzles.
   f. Oxidant Tubing
   g. Water Tubing
   h. PLC/HMI
   i. Installation Kit for Nozzle Assembly

1.02 REFERENCES:

A. Applicable Standards:

1. American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE):
   a. ASHRAE 62.1 - Ventilation for Acceptable Indoor Air Quality.
2. NFPA:
   a. NFPA 90A - Standard for the Installation of Air-Conditioning and Ventilating Systems.

B. Related Work Specified Elsewhere:

1. Protective Coatings – 09 90 00
2. Electrical – Division 26
3. Process Control Panels and Hardware – Section 40 67 00
4. Instrumentation for Process Systems – Section 40 70 00
5. Common Motor Requirements for Water and Wastewater Equipment – Section 46 05 13

1.03 SUBMITTALS:

A. Submit in accordance with Division 1.

B. Items for Submittal:

1. Certified shop and erection drawings showing details of construction, dimensions, and anchor bolt locations shall be approved and stamped by Missouri Licensed Engineer.
2. Descriptive literature, bulletins and catalogs of the equipment.

3. Standard shutdown operation procedures.
4. The total weight of the packaged equipment as well as the weight of the single largest items.
5. A complete bill of materials.
6. Calculations showing theoretical output of hydroxyl radical mist, based on various hydrogen sulfide concentrations.
7. Wiring Diagrams: For power, signal, and control wiring.

1.04 QUALITY ASSURANCE:

A. Manufacturer's Qualifications:
   1. Products used in the Work of this Section shall be produced by the Manufacturer regularly engaged in the manufacture of equipment of this type and with a history of successful installations.
   2. All equipment shall be the product of a manufacturer having U.S. installations for municipal wastewater applications with satisfactory service.

1.05 DELIVERY, STORAGE AND HANDLING:

A. Deliver unit to the jobsite complete with factory-installed lifting lugs, as appropriate.
B. Handle odor control cabinet and other system appurtenances carefully to avoid damage to components, enclosures, frames, housings, or finishes. Do not install units that have been damaged; replace and return all damaged items to the original manufacturer. Perform all necessary work to restore the equipment to a "new" condition, in which the factory warranty remains in full effect. Replace all damaged or missing safety or instructional labeling.
C. Store odor control equipment, in a clean dry place.

1.06 WARRANTIES:

A. The manufacturer shall warrant the odor control system and all components for each intended service and for a period not less than one (1) year following the date of Substantial Completion. The Contractor shall purchase any and all extended warranties, as necessary, to comply with the Specifications.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Subject to compliance with requirements, provide products by one of the following:
   1. Vapex Environmental Technologies
   2. Engineer Approved Equal.

2.02 GENERAL

A. The system shall be designed to operate in a wastewater environment and shall be furnished by a manufacturer experienced in the design and supply of hydroxyl radical odor control systems. The manufacturer of the odor control system shall be responsible for the system design and performance.
B. The odor control system cabinet shall be factory pre-piped and wired and ready for connection to power and water supply.
C. In addition to the requirements listed in this section, all electrical equipment and components shall conform to requirements in DIVISION 26 and DIVISION 40.

2.03 ODOR CONTROL SYSTEM PERFORMANCE REQUIREMENTS:

A. General: The system will be used to destroy vapor phase hydrogen sulfide, amines, other reduced sulfur compounds and odorous compounds by the means of a hydroxyl radical mist.
B. Site Conditions:

1. Elevation: 858.50 feet above sea level
2.

C. Coarse Screening Channel design criteria:
   1. Quantity of HV Nozzles: 3
   2. Nozzle Location: Shall be determined by odor control supplier, unless specified elsewhere.
   3. Odor control unit will be located outside. Weather protection enclosure shall be provided.
   4. Average Sulfide Concentration: 10 ppmv
   5. Peak Sulfide Concentration:100 ppmv
   6. Minimum water supply pressure: 60 psi
   7. Maximum Required coverage area: 31,000 ft^3
   8. Enclosure: Heated outdoor rated enclosure.

D. Thickened Sludge Tank Design Criteria:
   1. Quantity of HV Nozzles: 6
   2. Nozzle Location: Shall be determined by odor control supplier, unless specified elsewhere.
   3. Average Sulfide Concentration: 20 ppmv
   4. Peak Sulfide Concentration:200 ppmv
   5. Minimum water supply pressure: 60 psi
   6. Maximum Required coverage area: 30,000 ft^3 (15,000 ft^3/tank)
   7. Enclosure: Heated outdoor rated enclosure.

E. Performance Criteria for Coarse Screening Channels:
   8. Performance requirement (H_2S)
      a. H_2S removal efficiency ≥ 99.5% for headspace H_2S concentrations ≥ 10 ppmv but ≤ 100 ppmv
      b. Outlet H_2S concentration is ≤ 0.1 ppmv for headspace H_2S concentrations ≤ 10 ppmv

F. Performance Criteria for Thickened Sludge Holding Tanks:
   9. Performance requirement (H_2S)
      a. H_2S removal efficiency ≥ 99.5% for headspace H_2S concentrations ≥ 20 ppmv but ≤ 200 ppmv
      b. Outlet H_2S concentration is ≤ 0.1 ppmv for headspace H_2S concentrations ≤ 20 ppmv

G. Unit Construction:
   1. The base cabinet shall be water resistant, sound resistant, and conform to NEMA 3R specifications.

2.04 ELECTRICAL WORK:

A. Electrical equipment, motors, motor efficiencies, conduit, and wiring shall be in accordance with DIVISION 26. Electrical motor driven Equipment specified shall be provided. Each motor shall conform to SECTION 46 05 13 and be of sufficient size to drive the Equipment at the specified capacity without exceeding the nameplate rating of the motor. All motors shall be continuous duty with the enclosure specified.

2.05 ODOR CONTROL SYSTEM CONTROL PANEL

A. Odor control systems shall be supplied with a local control panel and HMI designed to house all components required to control the system.

B. Control Panel HMI shall be provided in accordance with requirements detailed in Section 40 67 00 in addition to specific panel requirements listed below.
   1. The main control panel shall contain a door mounted OIT for local control.
      a. OIT shall be Allen-Bradley Panel View. Refer to Section 40 67 00.
      b. All manufacturer supplied graphics and applications shall be developed with FactoryTalk View Machine Edition.

c. The screens developed shall utilize a "High Performance" design conforming to ISA 101.01 – Human Machine Interfaces for Process Automation Systems to provide situational awareness to the operator. HMI design and associated color schemes shall conform to those listed in Section 40 61 96 – 3.02 HMI STANDARDS AND SCREEN DEVELOPMENT.

d. In addition to controlling the Manufacturers equipment the supplied PLC and OIT shall be used for interfacing specified I/O with the Plant Control System screens.

(1) Coordinate with the Systems Integrator for exchange of the necessary I/O.

e. The manufacturer shall provide the necessary coordination with the Systems Integrator to ensure a fully functional application for use in remote monitoring.

C. Control panel shall be rated to be installed outdoors.

D. A panel mounted combination main disconnect switch and circuit breaker shall be accessible without opening the door.

E. Control panel shall include thermal magnetic circuit breakers for each motor load.

F. The control panel shall adhere to the following specifications:

1. Enclosure Rating: NEMA 4X, SST Type 304 or 316
2. Voltage: 208 Volt
3. Phase: 1 Phase
4. Frequency: 60 Hz
5. SCCR: 22 kA
6. Mounting: Skid Mounted

G. All Odor control system devices and equipment requiring electrical power shall be supplied by 208Vac local control panel input power. Provide power distribution and power conversion devices as necessary, in accordance with Section 40 67 00.

H. The control panel shall communicate with the plant PLC via an EtherNet/IP network, all controller I/O shall be accessible via the Ethernet network.

1. The following signals shall be provided to the Odor Control System Control Panel from the Plant Control System. via the Ethernet/IP network.
   a. System Inhibit.
      (1) Discrete signal which prevents all associated system equipment from running.
2. Refer to the Project I/O List, Section 40 61 96 A, for the minimum odor control system I/O to be available to the plant PLC. Additional I/O shall be provided as recommended by the manufacturer.

I. The equipment shall include an output relay for operation status. The output contact shall be dry, Form C, and rated for 5A at 120Vac.

J. All odor control system electrical devices and equipment shall be pre-wired to the local control panel.

K. Control panel shall be attached to the system's frame and be positioned such that there are no obstructions in front of the control panel per related NFPA 70 requirements.

L. Description of Operation

1. Process module functions to deliver water, compressed air, and oxidant to the injection nozzle as seen in the drawings. Injection nozzle combines the three (3) raw components (water, air, and ozone) to form the atomized hydroxyl mist, whereas the mist is released from the nozzle to drive the reaction within the Thickened Sludge Tank head space and Coarse Screen Channels
2. Nozzle shall be adjustable, allowing an optimization of the air/water dispersion ratio.
3. The atomizing injection nozzle shall be designed and constructed, allowing up to 98% absorption of the produced ozone into the atomized water flow. The atomized water particle shall be no larger than 5-micron in diameter.
   a. Sequence of Operation:
      (1) The odor control unit system and ancillary equpment including the O2 compressors, O2 condenser, ozone generator and air blower shall start. As the previously mentioned equipment start, the three way water supply solenoid valve shall open.

Water, air and oxidant will be conveyed to the six (6) injection nozzles where the three fluids will combine and be injected into the head space of the thickened sludge tanks.

b. System Upsets and Procedures for Recovery:
   (1) The odor control base cabinet shall contain safety interlocks for low water flow, low nozzle air pressure, low oxygen concentration, low oxygen flow and high oxidant generator temperature. Any out of range condition will cause a shutdown of the affected system and will trigger an alarm.

2.06 ACCESSORIES

1. The manufacturer shall supply the oxidant tubing for conveying ozone to each injection nozzle. Size and material of tubing shall be specified by manufacturer.
2. The manufacturer shall supply the water tubing for conveying water to each injection nozzle. Size and material of tubing shall be specified by manufacturer.
3. Installation kit and accessories required for mounting the nozzles to the flat panel FRP covers shall be provided. The openings in the FRP cover for installing the six (6) nozzles shall each be 10” diameter openings.
4. The odor control system shall have the capability to turn off oxidant flow to one (1) of the two (2) Thickened Sludge Holding Tanks while maintaining oxidant flow to the other Thickened Sludge Holding Tank.
5. The PVC carrier pipe containing the oxidant and water tubbing serving the six (6) injection nozzles shall be Schedule 80. Piping, fittings, and pipe supports shall be installed and supplied by the contractor in accordance with odor control supplier instructions.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install and adjust equipment in accordance with the Drawings, approved shop drawings, and the manufacturer's instructions. Do not operate the equipment until the installation is approved by the manufacturer’s representative.
B. Remove protective coatings and oils used for protection during shipment and installation.
C. Clean ozone tubing, water tubing, and air tubing before use as required by the pipe supplier.
D. Check equipment for correct direction of rotation and freedom of moving parts.
E. Align equipment to Manufacturer's tolerances.
F. Adjust or modify equipment to ensure proper operation.

3.02 FACTORY TESTING:

A. All major system components shall be factory tested for compliance with the construction and functional requirements specified herein, and certification of the results of these tests shall be submitted to Engineer prior to delivery of the equipment.
B. Odor control system shall be air tested with water at the factory under design conditions continuously for 4 hours. After completion of the test, the vessel shall be thoroughly inspected for evidence of failure.
C. Manufacturer shall record test results. Written certification of the tests shall be submitted to Engineer.
D. Contractor shall test the unit to demonstrate that all components function properly.

3.03 FIELD TESTING AND BALANCING:

A. Upon completion of installation of the odor control system, the system shall be tested and balanced for conformance with performance requirements and the design calculations.
B. Prior to start-up, all equipment shall be inspected for proper alignment, and proper connection.
C. Maximum noise levels shall not exceed 85-dB three feet away from the odor control unit.

3.04 PERFORMANCE TESTING

A. The Owner may schedule acceptance testing after 14 days following, and within 30 days, of start-up. The period between start-up and acceptance testing shall not exceed 60 days, except as authorized by the Engineer.
B. The odor control suppplier shall supply sample collection equipment and hydrogen sulfide monitoring instruments.
C. The ambient headspace hydrogen sulfide concentration in one (1) of the Thickened Sludge Tanks will be monitored and logged continuously over 72 hours with the odor control unit offline. The Engineer will select the perferred Thickened Sludge Tank for conducting the performance testing. Similarily, the ambitent headspace hydrogen sulfide concentration of the Coarse Screening Channels will be monitored and logged continously over 72 hours with the odor control unit offline.
D. The outlet hydrogen sulfide concentration at the gooseneck vent on one (1) of the Thickened Sludge Tank covers will be monitored and logged continuously over 72 hours with the odor control unit online. The Engineer will select the perferred Thickened Sludge Tank for conducting the performance testing. Similarily, outlet hydrogen sulfide concentration at the gooseneck vent for Coarse Screening Channels will be monitroed and logged continously over 72 hours with the odor control unit online.
E. To pass the acceptance test, the each odor control system shall meet Criterion target Performance in Paragraph 2.03.
F. If the system fails the acceptance test, the supplier shall conduct up two additional rounds of testing at no additional cost to the Owner. If the system does not pass after the additional testing, the supplier shall make whatever provisions are required to meet the criteria specified herein. The final acceptance test shall be passed no later than 3 months of the initial acceptance test.

END OF SECTION 44 31 19

DIVISION 46 – WATER AND WASTEWATER EQUIPMENT

SECTION 46 05 13 – COMMON MOTOR REQUIREMENTS FOR WATER AND WASTEWATER EQUIPMENT

PART 1 - GENERAL

1.01 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY:

A. This Section includes the following:
   1. Motors and accessories for mechanical, process, and other equipment.
   2. Unless specified or indicated otherwise, motors 1/2-horsepower or smaller shall be single phase and motors 3/4 horsepower or larger shall be polyphase.

1.03 RELATED REQUIREMENTS:

A. Section 26 05 26 – Grounding and Bonding for Electrical Systems.

1.04 REFERENCE STANDARDS:

A. Applicable Standards:
   1. American National Standards Institute (ANSI).
      a. ANSI B11.19 – Performance Criteria for Safeguarding.
   2. American Bearing Manufacturers Association (ABMA).
      a. ABMA 9 – Load Ratings and Fatigue Life for Ball Bearings.
   3. Institute of Electrical and Electronic Engineers (IEEE).
      a. IEEE 112 – Test Procedure for Polyphase Induction Motors and Generators.
   4. National Electrical Manufacturers Association (NEMA):
      a. NEMA MG 1 – Motors and Generators.

1.05 SUBMITTALS:

A. Submit as specified in Division 1.

B. Product Data: Submit the following as minimum:
   1. Nameplate information consisting of the following:
      a. Manufacturer's name and serial number.
      b. Horsepower output.
      c. Temperature rise and method indicated.
      d. Maximum ambient temperature.
      e. Rated Altitude
      f. Insulation class.
      g. Rpm at rated load.
      h. Operating frequency range.
      i. Number of poles.
      j. Number of phases.
      k. Voltage.
      l. Rated load amperes.
      m. Locked rotor amperes or code letter.
      n. Service factor.
      o. Power factor.
      p. Maximum noise level of pump/motor unit (dBA).

q. Efficiency, determined in accordance with IEEE 112, Method B.

2. Dimensions for enclosure and shafts.
3. Weight.
4. Bearing information.
5. Schematic diagrams for motor and specified motor accessories.
6. Statement from motor manufacturer specifying the variable frequency drive requirements for the motor to meet all requirements and recommendations of NEMA MG 1 – Part 30 and clause 31.4.4.2 Voltage Spikes NEMA MG 1 - Part 31 for all operational load and speed conditions specified and required.

C. Test and Evaluation Reports:
1. Factory test reports.
2. Field test reports.

D. Closeout Submittals: Final documentation shall include the following as minimum:
1. Operation and Maintenance Manuals including the following:
a. Operation and maintenance manuals for all components furnished.
b. Copies of all approved Product Data.
c. Copies of all approved Test Reports.
d. Warranty Information.
e. Contractor Information.

1.06 DELIVERY, STORAGE, AND HANDLING:

A. Motors shall be packaged, skidded and shipped to prevent damage during shipment.
B. Stored motors shall be environmentally protected and maintained according to manufacturer's recommendations.
C. If supplied, energize space heaters during storage to prevent condensation within the motor enclosure.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Motors:
1. Baldor Electric Company.
2. General Electric Company.
3. Marathon Electric Manufacturing Corporation.
4. Reliance Electric.
5. Siemens Energy and Automation, Inc.
6. TECO-Westinghouse Motor Company.
7. U.S. Motors, Nidec Motor Corporation.
8. WEG Electric Corporation.

B. Shaft Grounding Ring:
1. AEGIS, Electro Static Technology, Division of Illinois Tool Works Inc.
2. Inpro/Seal, Waukesha Bearings Corporation.
3. Helwig Carbon Products, Inc.
4. Engineer approved equal.

C. Couplings:
1. Rexnord Corporation, Division of RBS Global.
2. Waldron Hartig Machinery Division, Midland Ross Corporation.
3. Engineer approved equal.

2.02 HORIZONTAL SINGLE-PHASE MOTORS:

A. Rated for 40°C ambient temperature and continuous operation.
B. Voltage: 115V or 115/230V, 60 hertz.
C. RPM: 1750 unless indicated or specified otherwise.
D. Minimum service factor of 1.15.
E. Efficiency: Shall meet the premium efficiency motor standards as defined by NEMA MG 1.
F. Permanent split capacitor designed for low starting torque loads and applications requiring silent operation.
G. Capacitor start designed for high starting torque loads.
H. Shall be protected by an integral thermal-overload protective device in compliance with the NEC. Device shall automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Protection device shall automatically reset when the motor temperature returns to normal range.
I. Adequate to drive equipment over the full operating range without exceeding service factor.
J. Bearings as specified in HORIZONTAL POLYPHASE MOTORS, this Section.
K. Open drip-proof enclosures for clean, dry atmospheres and totally enclosed enclosures for wet or dirty atmospheres.
L. Manufacturer shall prepare surfaces, prime, and finish paint all surfaces with manufacturer's standard coating system. Coating system and color shall be suitable for intended service.
M. Stainless steel or mylar nameplate data on enclosure with all lubrication and electrical data.

2.03 HORIZONTAL POLYPHASE MOTORS:

A. Rated for 460-volt, 3 phase, and 60-hertz operation. Designed for operation with variable frequency drive, when indicated.
B. Squirrel cage induction type for across-the-line or reduced voltage starting, as indicated.
    1. Where reduced-voltage starting is indicated or specified the motor shall have torque requirements capable of bringing up the specified load to full speed. The reduced voltage starting shall be limited to 65% of nominal.
C. NEMA Design:
    1. NEMA B: Normal starting duty applications.
    2. NEMA C: High starting duty applications.
D. NEMA Class B insulation except for installations where NEMA Class F is recommended by the manufacturer for the application.
E. When controlled by variable frequency drives, motors shall comply with NEMA MG 1 Part 31.
F. Efficiency: Shall meet the premium efficiency motor standards as defined by NEMA MG 1.
G. Enclosures:
    1. Totally enclosed fan cooled (TEFC) for indoor and outdoor process areas.
    2. Explosionproof in explosive atmospheres.
H. Horsepower Rating Requirements:
    1. Ambient Temperature: 40°C.
    2. 1800 rpm unless specified or indicated otherwise.
    3. Service factor of 1.15.
    4. Adequate to drive equipment without using service factor except in emergency conditions.
I. Bearings:
    1. Pre-lubricated ball bearings shielded to prevent entrance to foreign materials.

2. Re-lubrication fittings and flushing system.
3. Minimum L10 bearing life for continuous operation of 100,000 hours to conform to ABMA 9.

J. Sound Pressure Levels (SPL) of the motor shall not exceed the maximum levels as specified in NEMA MG 1 Table 9-1.
K. Manufacturer shall prepare surfaces, prime, and finish paint all surfaces with manufacturer's standard coating system. Coating system and color shall be suitable for intended service.
L. Stainless steel nameplate with all electrical and lubricating information.
M. Refer to Article 2.07 MOTOR ACCESSORIES this Section for additional requirements.

2.04 VERTICAL POLYPHASE MOTORS:

A. Rated for 460-volt, 3 phase, 60-hertz operation. Designed for operation with variable frequency drive, when indicated.
B. Squirrel cage, induction type.
C. Hollow shaft design with non-reversing ratchet.
D. NEMA Design B:
1. Minimum starting torque 100% of full load.
2. Maximum torque greater than 200% of full load.
3. Maximum starting current 650% of full load.
E. NEMA Class B insulation except for installations where NEMA Class F is recommended by the manufacturer for the application.
F. Efficiency: Shall meet the premium efficiency motor standards as defined by NEMA MG 1.
G. Shall be "Inverter Duty", comply with NEMA MG 1 Part 30 and clause 31.4.4.2 Voltage Spikes of NEMA MG 1 – Part 31, and be rated for a minimum of 10:1 speed range for variable or constant torque loads.
H. TEFC enclosure with stainless steel hardware unless specified otherwise.
I. Corro/severe duty rated when specified or recommended by the equipment manufacturer.
J. Motor shall be factory balanced to reduce vibration levels to meet the refined vibration standards.
K. Horsepower Rating Requirements:
1. Ambient Temperature: 40°C.
2. Temperature Rise Per Table:

Continuous Rated Motors (All Enclosures)	Class B Insulation	Class F Insulation	Class H Insulation
	Temperature Rise by Resistance - °C		
S.F. 1.0	80	105	125
S.F. 1.15	90	115	---
	Temperature Rise by Embedded Detector - °C		
S.F. 1.0	90	115	140
S.F. 1.15	100	125	---

3. Service factor of 1.15.
4. 1800 rpm unless specified or indicated otherwise.
5. Adequate to drive equipment without using service factor except in emergency conditions.

L. Bearings:
   1. Designed for static and dynamic, and continuous and momentary thrusts as required by the driven equipment.
   2. Grease or oil lubricated bearings with re-lubrication fittings and flushing system.
   3. Antifriction type.
   4. Visual level indicator for oil lubricated bearings.
   5. Minimum L10 bearing life for continuous operation of 100,000 hours to conform to ABMA 9.

M. Screened openings or other suitable means for safety and protection from rodents or other animals.

N. Drip covers and lifting lugs.

O. Sound Pressure Levels (SPL) of the motor shall not exceed the maximum levels as specified in NEMA MG 1 Table 9-1.

P. Manufacturer shall prepare surfaces, prime, and finish paint all surfaces with manufacturer's standard coating system. Coating system and color shall be suitable for intended service.

Q. Stainless steel nameplate with all electrical and lubrication information.

R. Refer to Article 2.07 MOTOR ACCESSORIES this Section for additional requirements.

2.05 MULTI-SPEED MOTORS:

A. Same as specified in HORIZONTAL POLYPHASE MOTORS, this Section except for stator windings.

B. Stator Windings:
   1. Two-speed, two winding type, with a separate winding for each speed.

C. Torque Characteristics:
   1. Horsepower to vary directly with speed on constant torque applications such as feeders and conveyors.
   2. Horsepower to vary as the square of the speed on applications such as fans and centrifugal pumps.
   3. Rated horsepower at any speed for constant horsepower motors.

2.06 SUBMERSIBLE MOTORS:

A. Vertical squirrel-cage induction type.

B. NEMA Design B, Class F insulation. Class H insulation shall be provided when recommended by manufacturer for the application.

C. Rated 460 volts, 3 phase, 60 hertz.

D. Designed for operation with variable frequency drive.

E. Shall be "Inverter Duty", comply with NEMA MG 1 Part 30 and clause 31.4.4.2 Voltage Spikes of NEMA MG 1 – Part 31

F. Totally enclosed construction suitable for submerged service.

G. When installed within hazardous areas motors shall be suitable for operation in Class I, Division 1 locations.

H. Rating:
   1. Ambient temperature: 40°C.
   2. Service factor: 1.15.
   3. Speed as specified or indicated for each piece of equipment driven.
   4. Adequate to drive equipment without using service factor except in emergency conditions.
   5. Rated for continuous duty, capable of withstanding a minimum of 15 starts per hour.

I. For units with water jacket cooling system, include three disc-type temperature switches imbedded in the stator windings (one per phase) to stop motor on high-temperature conditions. Wiring included in the manufacturers provided pump cables.
   1. Motor supplier shall provide thermal sensing relay for integration into motor controls.

J. Provide water seal leak detectors between first and second mechanical seals with wiring included in the manufacturers provided pump cables.
   1. Motor supplier shall provide moisture sensing relay for integration into motor controls.

K. Supply cable for each pump of adequate length to reach from the motor to the indicated motor terminating junction box or power disconnect switch when the motor is in operating position.

L. Cable shall be coated with Hypalon or approved equal.

M. Provide stainless steel mesh cable grips for each pump cable to relieve strain from cable exiting the junction box.

N. Manufacturer shall prepare surfaces, prime, and finish paint all surfaces with manufacturer's standard coating system. Coating system and color shall be suitable for intended services.

O. Stainless steel data nameplate with all lubrication and electrical data located at each motor.

2.07 MOTOR ACCESSORIES:

A. When indicated or specified, provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
   1. The temperature at which the contacts open will be chosen by the manufacturer to protect the motor when it overheats.

B. When indicated or specified, provide motor space heaters as follows:
   1. Motor space heaters shall be securely attached to the motor windings and sized to maintain the motor internal temperature above the dew point when the motor is not running.
   2. Space heaters shall be silicon rubber type designed for long life and low skin temperature.
   3. Motor space heaters shall be operated at 120Vac.

C. When indicated or specified, motor shall be fitted with a Pt-100 sensor for continuous temperature monitoring and over-temperature protection.
   1. Provide with temperature monitoring relay compatible with sensor provided for remote mounting and integration into the indicated motor controls.
      a. Motor manufacturer shall provide the required temperature set points for proper protection of motor supplied.
   2. Relay shall be designed for DIN-rail mounting.
   3. Provide sensor with sufficient length of cable to allow splicing for connection to the remote mounted temperature monitoring relay.

D. For motors controlled by variable frequency drives, provide factory installed, maintenance free, circumferential, conductive micro fiber shaft grounding ring to discharge shaft currents to ground. Motors rated 100HP and greater shall provide an insulated opposite drive end bearing.

E. Motor conduit boxes shall be oversized to permit solderless connection of external leads and shall be designed to accept the number and size of conduits indicated.
   1. Motor leads permanently identified and of sufficient length to allow easy connection of external leads.

F. Provision for grounding motor frame.

2.08 BELT GUARDS:

A. Fully enclose belts on both sides except where equipment forms one side.
B. Size to enclose next larger size driven pulley.
C. Two-piece construction when driven equipment and motor are on opposite sides of the belt guard.
D. Provide with tachometer holes and covers.
E. Protective guard shall conform to ANSI B11.19 – Performance Requirements for Safeguarding.

2.09 BELT DRIVES:

A. Single or multiple V-belt.
B. Rated 140% of motor horsepower.
C. Adjustable speed with maximum belt speed of 4,500 fpm.
D. Matched sets of belts on multiple belt drives.
E. Adjustable slide rail motor mounts.
F. Adjustable screw type LVP or MVP for over one groove on motors less than 50 hp.
G. Motors 50 hp and larger may be furnished with two nonadjustable motor pulleys, one for testing and for final operation.

2.10 COUPLINGS:

A. Type as required for specific application as acceptable to Engineer.
B. Protective guard shall conform to ANSI B11.19 – Performance Requirements for Safeguarding.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. Install to conform to manufacturer's instruction.
B. Lubricate all bearings, gears and items requiring lubrication before placing equipment in operation.

3.02 FIELD QUALITY CONTROL:

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust motors, assemblies, and associated equipment installations, including connections.
B. Field Testing:
   1. Provide manufacturer recommended testing prior to startup of motors.
   2. Testing shall be performed in accordance with IEEE 112.
   3. Check equipment ground to assure continuity of connections as specified in Division 26.
   4. Measure the insulation resistance of the stator winding before applying voltage. Compare this measured value against the manufacturer's value. If there is no insulation resistance value furnished by manufacturer, use the following:

Motor Voltage	Insulation Resistance
600 volts and below	5 megohms

a. If measured resistance values are lower than above, record room temperature and humidity and submit readings to Engineer before energizing. Dry out motors as required by accepted method of application of external heat, and do not apply voltage to motor until substandard resistance condition is corrected. Megger readings are to be one-minute duration, using a 500V megger for all motors 600V and below.

5. After the motor is placed in operation, observe the motor for heating at the bearings or windings. If the motor appears to be running hot, notify Engineer.
   a. Note: General purpose motors may reach temperatures up to 176ºF with a room temperature of 104ºF.
6. Take motor full load amps readings on all phases. Record voltage and current for each phase at time of measurement.
7. Prepare all results and submit field testing and startup report to Engineer.

3.03 FINISHES:

A. Equipment coatings shall be free from scratches, rust, or other defects.
B. All damaged or defective coatings shall be repaired prior to final acceptance.
C. Field Painting:
   1. Touch Up:
      a. Contractor shall prepare surfaces and touch up manufacturer applied coatings as required for any damage during shipment and installation.
      b. Field painting shall be performed based on manufacturer's recommended procedures.
      c. Motor manufacturer shall furnish Contractor with an adequate quantity of touch-up paint to match the factory applied finish.

END OF SECTION 46 05 13

SECTION 46 21 13 – COARSE SCREENING EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the supply of two screens and all associated control systems as shown on the Drawings and specified herein. The treatment objective for the screens is to capture and remove particles from raw wastewater. The screenings are to be collected in a roll-off dumpster.

B. All equipment specified in this Section shall be suitable for installation in the structures as indicated. Any revisions necessary to accommodate the equipment furnished shall be the responsibility of the Supplier.

C. Related Work Specified Elsewhere:
   1. Contract Drawings.
   2. General Requirements: Division 1.
   3. Painting: Division 9.
   4. Section 40 66 00 – Process Control Networks
   5. Section 40 67 00 – Process Control Panels and Hardware
   6. Section 40 70 00 – Instrumentation for Process Systems
   7. Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment

1.02 REFERENCES:

A. Applicable Standards:

   2. American Gear Manufacturers Association (AGMA).
   3. American Iron and Steel Institute (AISI).
   4. American National Standards Institute (ANSI).
   5. American Society of Mechanical Engineers (ASME)
   6. American Society for Testing and Materials (ASTM):
      a. A36 - Structural Steel.
      b. A126 - Gray Iron Castings.
   7. National Electric Code (NEC)
   8. National Electrical Manufacturers Association (NEMA).
   9. National Fire Protection Association (NFPA).
   10. Occupational Safety and Health Act (OSHA).
   11. Underwriters Laboratories (UL).
   12. Institute of Electrical and Electronic Engineers (IEEE).

1.03 QUALITY ASSURANCE:

A. Refer to Division 01 for requirements.

1.04 SUPPLIER SUBMITTALS:

A. Submit as specified in DIVISION 01.

B. Includes, but is not limited to the following:
   1. Complete manufacturer's data, specifications, and detailed drawings for all equipment and materials which shall include complete descriptive data to define materials sizes, capacities, types, models, accessories, etc. Drawings and other information shall be suitable for erection and installation of equipment and materials.
   2. Recommended spare parts list.

3. Electric power requirements, wiring diagrams, and schematics for all electrical equipment and devices.
4. Control panel HMI screens.
5. All structural loads imparted to the structure.
6. Anchoring details.
7. Submit screen headloss calculations at peak and design flows. The calculations shall include clean screen 0% blinded and 30% of screen panel area blinded.
8. Manufacturer's surface preparation, shop priming, and machined metal surface rust inhibitive compound requirements.
9. List of installations, as described in Quality Assurance, including current Owner representative name, address, telephone number, and email.

C. Operation and Maintenance Manual includes, but not limited to, the following:
1. Special shipping, storage, protection, and handling instructions including dimensions of each container or package shipped.
2. Recommended unloading method at project site including implement (e.g., forklift, etc.) and maximum container or package weight.
3. Manufacturer’s printed installation instructions.
4. The manual shall be prepared specifically for this installation and shall include all required cuts, drawings, equipment lists, descriptions, etc. that are required to instruct operating and maintenance personnel unfamiliar with such equipment. The maintenance instructions shall include trouble shooting data, full preventative maintenance schedule and complete spare parts lists with order information. In addition, the manuals shall include the following at a minimum:
a. Complete parts list cross-referenced to an exploded view assembly or equivalent drawing.
b. Dimensional drawings of all provided equipment with component weights.
c. Complete preventative maintenance procedures (including recommended intervals).
d. Alignment, adjustment, and repair instructions.

1.05 DELIVERY, STORAGE, AND HANDLING:

A. Deliver, store and handle all equipment and materials in accordance with the requirements in Division 01.

1.06 WARRANTY:

A. Shall be as specified in DIVISION 01.

PART 2 - PRODUCTS

2.01 ACCEPTABLE SUPPLIERS:

A. Subject to compliance with the specifications, provide one of the following suppliers:
1. Screens:
a. Duperon Corporation.
b. Parkson Corporation.

2.02 SERVICE CONDITIONS:

A. The screening system shall be used to screen raw domestic wastewater gravity fed from the collection system and prior to influent pumping.
B. Screenings captured and collected from the screens are to be collected in a roll-off dumpster supplied by the Owner.
C. Equipment to be installed indoors in Kansas City, Missouri.

2.03 DESIGN AND PERFORMANCE REQUIREMENTS:

A. Screens:
   1. Number of units: 2.
   2. Maximum effective spacing: 1/4 inch.
   3. Angle of screen: 80 degrees from horizontal.

B. Design Flows and Screenings Load:
   1. Peak flow per screen: 15 MGD.
   2. Current average daily plant flow: 2.2 MGD.
   3. Design average daily plant flow: 4.6 MGD
   4. Design screenings volume rate: 15 ft^3 per MG.

C. Dimensions and Elevations:
   1. Screen channel width: 3 feet.
   2. Screen channel depth: 42.33 feet (from screening structure floor to channel invert).
   3. Water level downstream at design average daily plant flow: 1.80 feet
   4. Water level downstream at peak flow: 2.75 feet.
   5. Maximum allowable hydraulic headloss at peak flow (at 30% blinding): 6 inches.
   6. Channel bottom elevation: 813.67 feet.
   7. Screen Room operating floor elevation: 856.0 feet. Screening equipment supports shall be mounted on 6-inch concrete bases.

D. All materials shall be 304L stainless steel unless otherwise specified.

2.04 MECHANICALLY CLEANED BAR SCREEN:

A. General:
   1. The mechanically cleaned screen shall be a stainless-steel link driven, front-cleaning, front-return type mechanically cleaned bar screen. The screen will be self-contained and shall capture and transport wastewater debris to the discharge point. The screen shall consist of 316SSTL teardrop shaped bars, spaced to create a fabricated and stiffened grid which is carried on supports spanning the channel. Back cleaned or rear-return type mechanically cleaned screens will not be acceptable.
   2. The screenings are mechanically cleaned from the bar rack by rakes with tine plates mounted on carriers attached to the links of the roller chains on each side of the screen. The complete screen is constructed such that it forms a strong and rigid integral structure which is secured to the support beams which span the width of the chamber.
   3. The mechanically cleaned screen shall clean continuously, from bottom to top, the entire width of the rake. The debris will be removed from the bar racks by the cleaning rakes, conveyed up the dead plate to the discharge point where the rakes will be cleaned by the rake wiper.
   4. The bar screen will include: cleaning rakes, rake wiper, links, shafts, bearings, drive unit complete with reducer, motor, side frames with lifting lugs, bar rack, dead plate, discharge chute, head section, side wall sealing plates, controls, and any other appurtenances required for a complete operating system.
   5. Wear parts requiring periodic inspection, maintenance, and replacement should be fully replaceable without having to remove the screen from the channel.
   6. The screen frame shall be supplied in one piece requiring no field assembly other than that necessitated by shipping requirements and protection of the equipment.
   7. All fasteners, bolts, and nuts shall be of AISI Type 316 stainless steel and furnished by the supplier. Anchor bolts shall be AISI Type 316 stainless steel and at least 1/2-inch diameter. Anchor bolts shall be provided by supplier.
   8. All non-corrosive materials shall be used in components traveling underwater.

9. The design shall be such to enable all maintenance to be accomplished at the operating floor level.

B. System Components:
   1. Side Frames:
      a. The side frames will be constructed of minimum 1/4 inch thick type 304 stainless steel plate and braced as required.
      b. The side frame will have a stainless steel guide system for both the carrying and return run of the screen chain. The guides will provide minimal clearance to prevent debris from coming in contact with the screen chains.
      c. Lower return guides shall allow for proper alignment of rakes as they engage the bar screen.
      d. Closures shall be provided to assure that there is no space wider than the opening between the bars, to prevent passage of larger solids, than allowed through the screen. Closures shall be incorporated into the side fabrication framework and return guides.
      e. Side wall seal plates with 1/4-inch thick neoprene strip will be furnished with the screen to close off the area between the side frames and channel walls. Stainless steel may be used in lieu of neoprene for closeout between side frame and channel wall as long as no opening greater the 1/4-inch is present. The seal plates will be not less than 14 gauge type 304L stainless steel and extend from the channel floor to at least 12-inches above maximum sewage depth.
      f. Lifting lugs or pick points will be provided on the side frames near the channel floor.
   2. Bar Screen:
      a. The bar rack will extend from the invert of the channel to the height indicated in Part 2.03.C where it will be connected to a dead plate on which the screenings will be lifted to the discharge apex prior to discharging into dumpster.
      b. The bar screen shall be of AISI Type 316 stainless steel and shall be spaced to maintain a 1/4 inch clear opening. The bar screen shall be able to withstand a 2 foot head differential.
      c. The bar screen anchors and fasteners shall be of stainless steel.
      d. Bars shall be removable from the bar rack assembly in individual bars or multiple bar subassemblies. Bars shall not be welded in place. Bar racks that use welded bars are not acceptable.
   3. Link System:
      a. The chain links shall be 316 stainless steel and shall be joined with stainless steel pins.
      b. The drive shaft will be stainless steel and be supported on each side by grease lubricated take-up bearing assemblies. The bearings may also be self-lubricating.
   4. Rakes:
      a. The rakes will be stainless steel, reinforced, and bolted to the stainless steel links on each side.
      b. The stainless steel rake tines shall penetrate into the screen bar spacing to such that screenings are completely cleared during each lifting operation. The rake tines shall be suitable shape to effectively clean the front and sides of the bars and shall have adequate stiffness and strength to cope with the specified duty cycle. The rake bar will be at least 1/4 inch thick stainless steel and shall be replaceable.
      c. Spacing between rakes shall be as determined by supplier to effectively remove the design screenings volume rate listed in part 2.03.D.
      d. The rake speed shall be as determined by the supplier to effectively remove the design screenings volume rate listed in part 2.03.D.

e. If scrapers are included, they shall be made of 1" thick wide UV resistant UHMW-PE and span the width of the bar rack. Scrapers shall have a serrated edge designed to clean the face of the bar rack. Units shall be provided with a stainless steel backing angle.

5. Dead Plate:
   a. Dead plate shall be at least 1/4 inch thick, AISI Type 304L stainless steel. Dead plate shall span the entire width of the screen and transition from bar rack to discharge point.
   b. The rake head teeth shall ride no closer than 1/16-inch from the dead plate and no further than ¼-inch from the dead plate.
6. Rake Wiper/Debris Blade:
   a. The wiper will be 304L stainless steel, pivoting and be easily adjustable.
   b. The wiper will have a replaceable UHMW Polyethylene blade.
   c. The design shall be such that the rack repositions the wiper mechanism. The wiper mechanism design shall allow the rake assembly to operate in reverse, through the wiper mechanism, without the need to manually lift the wiper assembly.
7. Discharge Chute:
   a. An enclosed discharge chute of minimum 11 gauge (1/8 inch) AISI Type 304 stainless steel shall be bolted or welded to the dead plate per supplier's recommendation and will discharge to the roll-off dumpster.
   b. The height of the discharge chute will be as required to accommodate roll-off dumpster as shown on Drawings.
8. Side Shields:
   a. Side shields shall be stainless steel 304L and shall be present from intermediate deck to operating deck.
9. Channel Bottom Plate:
   a. An AISI Type 304L stainless steel channel bottom plate shall be utilized as recommended by the supplier to fully engage rakes in the bar screen at the bottom of the channel.
   b. The channel bottom plate may require anchoring dependent upon site configuration and as recommended by the supplier.
10. Screen Enclosure:
    a. The portion of the screen above the top of operating level will have stainless steel guards.
    b. The guards will provide quick access panels for equipment maintenance.
    c. The panels shall be manufactured of 304L stainless steel held in place by latches. Each panel shall be provided with handles for panel removal/replacement. All handles and latches shall be 304L stainless steel.
11. Upper Bearings:
    a. Bearing shall be a non-lubricated no maintenance engineered polymer Thordon® or Vesconite® bearings and shall have a PV value that is less than the limiting PV value of the material. Bearings containing grease are not acceptable.
12. Drive Unit:
    a. Each mechanically cleaned screen unit shall operate independently and will have its own drive unit and driven components.
    b. The electric motor shall be TEFC, NEMA Design B with Class F insulation, rated for Class I, Division 2, Group D hazardous environment. The motor shall be no larger than 1 Hp, and run from a 460V, 3-phase, 60-hertz electrical supply.
    c. The enclosure shall be of weather protected design.

d. The drive unit speed reducer will be of the helical gear or spiral bevel type, fully housed, running in oil or grease, with anti-friction bearings throughout.
e. The drive unit will be assembled by the Supplier and shipped as a complete assembly to ensure proper assembly of all components.
f. Refer to the Drawings for orientation of drive units.

13. Spare Parts and Special Tools:
    a. Refer to 40 67 00
    b. One (1) wiper blade.
    c. Ten (10) retaining rings.
    d. Four (4) chain pins.
    e. Four (4) rake screws, nuts, and hardware.
    f. Four (4) scraper screws, nuts, and hardware.
    g. One (1) tube of Never Seez.
    h. Any additional recommended spare parts.

2.04 PROTECTIVE COATINGS:

A. Motor, gear reducer, and all metallic surfaces except aluminum and stainless steel shall be factory painted with the Supplier's standard coating equal to the 09 90 00 E-1 system and field touched-up.
B. Coatings other than those listed in 09 90 00, System E-1 may be submitted but must receive the approval of the Purchaser.
C. Provide field touch-up paint kit.

2.05 SCREEN SYSTEM CONTROLS AND INSTRUMENTATION:

A. The Screen System shall be supplied with a main system control panel designed to house all components required to control the screen system and associated equipment.
B. The screening equipment supplier shall provide all control components and instruments as specified herein.
C. System Components and Function:
    1. Screen System Main Control Panels: IPS-MCP-010, IPS-MCP-020.
        a. As described below.
    2. Bar Screens: IPS-SCR-010, IPS-SCR-020.
        a. Mechanical screen designed to remove solids and debris from the liquid stream
    3. Radar Level Transmitters as defined in the following table:

Bar Screen	Upstream Level Sensor	Downstream Level Sensor	Level Indicating Transmitter	High-Level Switch
IPS-SCR-010	IPS-LT-010A	IPS-LT-010B	IPS-LIT-010	IPS-LSH-010
IPS-SCR-020	IPS-LT-020A	IPS-LT-020B	IPS-LIT-010	IPS-LSH-020

D. Description of Operation
    1. The screening equipment shall be provided with a control panel equipped with a PLC and an operator interface for setpoint adjustment and monitoring.
    2. The system shall have control stations provided and mounted adjacent to the equipment to allow for local operation of the equipment.
    3. The supplier supplied control panel shall serve as the primary control point for the equipment and all controls described shall be available through an operator interface screen (HMI).

4. Bar Screens IPS-SCR-010 and IPS-SCR-020
   a. The screens shall be started and stopped at the HMI by Hand/Off/Auto operation selection. The functionality described below shall be per screen (i.e. each screen will have a dedicated differential measurement and control sequence)
      (1) In HAND mode, the equipment will run continuously until stopped by the operator.
      (2) In OFF mode the equipment will not run.
      (3) In AUTO mode, the equipment will be started and stopped by the screen system PLC. The PLC programming shall be as described below.
         (a) The screen shall be started and stopped by the system PLC based upon channel head differential across the screens as measured by the corresponding level transmitters.
         (b) The screen system shall start at normal speed when the upstream level reaches start level setpoint. An operator-adjustable start level setpoint shall be programmed.
         (c) The screen system shall run at high speed when the calculated differential level reaches differential level setpoint. An operator adjustable level differential setpoint shall be programmed.
         (d) The screen system shall operate continuously at high speed until the differential level falls below the differential level setpoint. The screen should then return to normal speed.
         (e) The screen system shall operate at normal speed until the upstream level falls below the start level setpoint. The screen system shall then operate for an operator adjustable length of time before stopping.
         (f) A backup timer shall be provided to operate the screens periodically and if a failure occurs with the level controls, the timer setpoint shall be adjustable through the operator interface mounted on the face of the main control panel.
         (g) The parameters for the upstream start level, channel head differential level, and cycle time between operations shall be set at the supplier provided operator interface on the main control panel.
         (h) A “CYCLE START” operator soft push button shall be provided on the face of the local control panel. If the CYCLE START push button is depressed, the PLC shall immediately initiate a screen cycle for the associated screen.
         (i) High Flow Mode and Remote Cycle:
            1) While in AUTO, the screen system shall accept a start signal from the plant control system for remote start capability.
   b. System Upsets and Procedures for Recovery:
      (1) If a screen failure occurs, the control system shall alarm the operator via the operator workstation.
      (2) If a power failure occurs, the equipment that was in operation prior to the power failure shall be automatically restarted by the manufacturer-provided control panel.
      (3) If a level transmitter signal is lost, the control system shall alarm the operator via the operator workstation.
      (4) If a jam or over-torque condition occurs in the screen that cannot be cleared by the system, the associated equipment shall automatically stop and initiate a failure alarm at the operator workstation.
      (5) Safety Devices:

(a) Emergency stop push buttons and pull cord switches, as applicable, shall be interlocked with the corresponding screen starting circuit.
(b) In the event of an emergency stop push activation, the corresponding equipment will shut down and alarm the operator. The emergency stops shall require a manual reset to restart the equipment.
(c) An emergency stop condition shall initiate an e-stop alarm at the operator workstation.

c. The upstream and downstream levels for each of the screens shall be available for display on the operator interface in units of feet. Operator adjustable upstream and differential level alarms shall be programmed for the screen.

E. Setpoints and Ranges:
1. Level Transmitters
a. All level transmitters shall be calibrated and configured to provide a range of measurement from the blanking distance of the transmitter to the bottom of the channel.
2. Screen System Operator Interface:
a. Screen Level Transmitters
(1) Display range measure value in feet for each level transmitter.
(2) High level alarm adjustable between 0-1 feet, initially set at 0.8 feet for the upstream level transmitter.
(3) Differential level setpoint adjustable between 0.25-2.00 feet, initially set at 0.5 feet for each screen.
b. Backup cycle timer adjustable between 0-30 minutes, initially set at 15 minutes.
3. System Upsets and Procedures for Recovery:
a. The system shall send an alarm for the screen to the Process Control System under any of the following conditions:
(1) Any motor or other component critical to the operation of the screens is faulted.
(2) If a level transmitter signal is lost.
(3) If a jam is not cleared.
b. If a power failure occurs, the screen shall be automatically restarted by the supplier provided main control panel without requiring a manual reset.
c. If a jam occurs in a screen, the screen control system shall automatically initiate the supplier standard reversing sequence and attempt to clear the jam. If the jam is not cleared, the control system shall initiate a failure alarm at the operator workstation.
d. If an overload occurs in the screen, the screen shall automatically stop and initiate and failure alarm at the operator workstation.
e. System in AUTO mode:
(1) If a level signal is lost, the screen shall operate on a timer. If the level signal is restored, the screen shall be returned to normal operation.
f. Safety Devices:
(1) Emergency stops shall be interlocked with all motor circuits in the screen.
(2) In the event of an emergency stop situation, the equipment will shut down and alarm the operator via the operator workstation.
(3) The system shall not restart until the operator clears the alarm from the equipment and/or the main control panel as applicable.
(a) The emergency stop pushbuttons require a manual reset to deactivate the alarm.

F. The screening equipment supplier shall provide all control components and instruments as specified herein.

G. Screen System Control Panel:
   1. Control panels and components shall conform to Section 40 67 00.
   2. The control panel shall be designed for installation within a conditioned electrical room.
   3. The control panel shall be a NEMA 12 rated enclosure with use of ventilation for thermal management as required.
   4. The control panel shall be equipped with an Allen-Bradley CompactLogix PLC to provide control and monitoring of the supplied equipment.
   5. The supplier supplied PLC shall be connected to the Plant Control System through an Ethernet network connection. Provide a network switch as required for communicating the Screen system data over an Ethernet/IP network as well as providing connectivity to the operator interface. The panel programmer shall provide a data/memory map to the project's systems integrator which includes all produced tags and assigned IP addresses as required to enable communication between the control panel and the communication network. Provide a network switch as required to provide a complete and functional system as specified in 40 66 00.
   6. IP address assigned to PLC for uplink to plant network shall be reconfigurable and on a separate subnet than the Screen System's local network.
   7. The enclosure width shall not exceed 3'-0".
   8. The control panel shall be powered from a single 480V, 3-phase power source.
   9. The control panel shall be supplied with a 480-120V control power transformer to provide power to 120V devices in the panel.
   10. The control panel shall include provisions for connection of one (1) 120Vac, 20-Amp field supplied circuit and the internal derived 120Vac circuit from the specified 480V-120V CPT. The CPT derived circuit shall be used as "House" power for lights, fans, receptacles, etc. The field connected circuit shall be derived from the centralized UPS system and shall power all PLC, network, OIT, and control system related loads within the control panel.
   11. The control panel shall contain all required components for complete control and monitoring of the screening units, level controls and other associated equipment. As a minimum, the following components shall be installed in the panel:
       a. Door interlocked main disconnect circuit breaker.
       b. Motor starters with solid state overloads and/or VFD's for the screen units.
       c. Control power transformer.
       d. Programmable Logic Controller (PLC).
       e. Operator interface touch screen.
       f. Required circuit breakers, control relays, power supplies, selector switches and indicating lights.
   12. Operator Interface Touch Screen:
       a. The control panel shall include a 15-inch operator interface touch screen.
       b. Provide an Allen-Bradley PanelView Plus as specified in Section 40 67 00.
       c. All supplier supplied graphics and applications shall be developed with FactoryTalk View Machine Edition.
       d. The screens developed shall utilize high performance graphic styles using gray scale color palettes for all equipment when possible.
       e. In addition to controlling the Suppliers equipment the supplied touch screen shall be used for interfacing with the Plant Control System. Supplier shall provide the developed screen system application files to the Systems Integrator to allow further development and addition of the screens.

f. Supplier shall provide the necessary coordination with the Systems Integrator to ensure a fully functional application.

13. All devices shall be factory installed, wired and tested. Terminal blocks shall be provided and labeled as required for power, control and instrumentation.
14. The Screen System Control Panel shall provide the following discrete signals for use by the Plant Control System. The signals shall be communicated via the Ethernet/IP network.
    a. Screen "Auto" Mode for both screens.
    b. Screen "Hand" Mode for both screens.
    c. Screen Run Status for both screens.
    d. Screen Emergency Stop for both screens.
    e. Screen Failure for both screens (Common alarm for all associated equipment with the associated screen).
15. The Screen System Control Panel shall provide the following analog values over the Ethernet/IP network for use by the Plant Control System.
    a. Screen Influent Level for both screens.
    b. Screen Effluent Level for both screens.
16. As a minimum the following functionality shall be available via the operator interface screen:
    a. Hand/Off/Auto switch position for each piece of equipment.
    b. Power On indication for each piece of equipment.
    c. Forward indication for each piece of equipment.
    d. Reverse indication for each screen.
    e. Fault or Failure indication for each piece of equipment.
    f. Motor overtemperature indication for each motor.
17. Additional status points and adjustment of set points and operating parameters shall be available via the operator interface screen. As a minimum, the following parameters and status points shall be viewable and/or adjustable via the operator interface screen:
    a. Upstream Start Level for each screen.
    b. Screen Head Differential for each screen.
    c. Screen Head Differential Set Point for each screen.
    d. Backup Timer Setting.
    e. Run Time.
    f. Run Status indication for all equipment.
    g. Identify cause of equipment Failure.

H. Screening Unit Local Control Station (one per screen):
1. Refer to Section 40 67 00 for control station requirements and component specifications.
2. The panel shall be a NEMA Type 4X 304 SST enclosure to be installed outside adjacent to each screen. All selector switches, pushbuttons, and indicators shall be hermetically sealed for installation in a Class I, Division 2, Group D area.
3. The panel shall contain all required components to implement the control functionality specified and allow for the electrical connection of the skid mounted equipment to the main control panel. As a minimum, the following components shall be installed in the face of the panel:
    a. Hand, Off, Auto selector switch
    b. Run/Stop indicating lights.
    c. Emergency stop pushbutton.
    d. Control Station Identification Label.
4. As a minimum the following shall be installed inside the panel.
    a. Terminal blocks for all field connections required.

I. Screen Level Sensors:
   1. The screening units shall be provided with radar level transmitters or laser level transmitters. The level transmitters shall initiate screen operation based on channel head differential and the parameters set in the operator interface.
      a. The PLC logic shall determine differential levels using signals from two separately mounted level transmitters.
      b. The first transmitter shall be installed upstream of the screen and measures the screen upstream head. The second transmitter shall be installed downstream of the screen and measures the downstream head of the screen.
      c. The head in front (upstream) of the screen shall be compared to the head downstream of the screen to determine the head differential.
   2. Level Transmitter IPS-LIT-010 and IPS-LIT-020:
      a. Provide a level transmitter mounted for each screening unit.
      b. The upstream and downstream sensors' 4-20mA level signal instrumentation cables shall terminate to the transmitter. The transmitter shall provide upstream and downstream levels to the main control panel via 4-20mA outputs. The transmitter shall display upstream, downstream, and differential level.
      c. The transmitter shall be rated for installation in a Class I, Division 2, Group D area. The transmitter shall provide intrinsically safe connections for the level transducers.
      d. Power for the level transmitter shall be provided from the main control panel via thermal magnetic circuit breaker.
   3. Level sensors shall be a 2-wire device and perform non-contacting liquid level measurements with signal outputs of 4-20mA to the screen system PLC.
   4. The level sensors shall be intrinsically safe and suitable for installation in a Class I, Division 2, Group D area. Required intrinsically safe barriers shall be installed in the main control panel if required for the indicating transmitter.
   5. Refer to Section 40 70 00 for level transmitter specifications. Provide quantity of sensors and transmitters as required with measurement ranges and blanking distances necessary for the measurement in the indicated screen channels.

J. High Level Probe:
   1. Provide a high-level conductivity probe for installation in each channel, upstream of each screen.
   2. The probes shall be intrinsically safe and suitable for installation in a Class I, Division 2, Group D area. Where required, provide and install intrinsically safe barriers in the main control panel.
   3. Provide and install an intrinsically safe control relay for each probe in the main control panel. Relay shall provide an alarm to the PLC via a N.O. and N.C. output contact upon high level detection by probe.
   4. Provide the necessary stainless steel hardware, mounting brackets or fittings, manufacturer cables, and strain relief for securing the probes in the channel. Installation shall be coordinated with the channel grating to allow access and removal.
   5. Refer to Section 40 70 00 – Instrumentation for Process Systems for conductivity probe specifications.

K.

L. Source Quality Control:
   1. The Screen System and controller shall be factory tested to ensure satisfactory operation.

M. Accessories:
   1. Provide all templates and special wrenches or tools necessary for proper installation and maintenance of equipment.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Motor, gear reducer, and all metallic surfaces except aluminum and stainless steel shall be factory painted for shipping purposes. Stainless steel and aluminum surfaces shall not be painted. Prepare surfaces in shop and finish all surfaces as specified in Division 9.
B. Store all Equipment as specified in Division 1 and as required to prevent damage.
C. Assemble and test drive units in factory.

3.02 INSTALLATION:

A. In accordance with manufacturer's instructions and as indicated.
B. Install all electrical conduits, wires, tubing, instrumentation and other appurtenances as required for satisfactory operation.
C. Prepare surface and paint or touch up all surfaces as specified herein and in Division 9.

3.03 FIELD QUALITY CONTROL AND ADJUSTMENTS:

A. Manufacturer's Field Services: Provide all services as specified in Division 1 and as follows:
B. The equipment suppliers shall furnish the services of a factory-trained representative on site for a period of no less than four days and two trips. The representative shall inspect, adjust, calibrate and place the system into operation. If additional services are required to produce a fully operational system, they shall be provided at no cost to the Owner.
C. Training:
    1. The on-site services provided by the factory-trained representative shall include training.
    2. The representative shall provide two complete training sessions to the Owner operating personnel in equipment operation and maintenance. Sessions shall be a minimum of two hours in length, or as required to complete the entire training.
    3. One of the sessions shall be video recorded, placed on a USB, and transmitted to Owner for use in training future personnel.
D. After installation and after all equipment and components are in operable condition, a field mechanical and electrical performance test shall be performed in the presence of the Engineer.
    1. Each piece of equipment shall be tested for normal start, stop, and emergency stop cycles.
    2. Each piece of equipment shall be field tested, and the equipment calibrated to demonstrate to the Engineer that all equipment will satisfactorily perform the functions and criteria specified.
    3. Furnish test forms and procedures for field testing and provide all test apparatus required at no additional cost to the Owner.
    4. Follow testing procedures recommended by the equipment manufacturer and approved by the Engineer.
    5. The equipment supplier shall modify or replace any equipment necessary to obtain satisfactory performance.
E. All labor, materials, and test apparatus necessary for conducting the above tests shall be furnished by the Contractor at no additional cost to the Owner, unless stated otherwise.

END OF SECTION 46 21 16

SECTION 46 21 16 - SCREENING EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the furnishing and installation of two screens, two screenings washer/compactors, and all associated control systems as shown on the Drawings and specified herein. The treatment objective for the screens is to capture and remove particles from wastewater that has gone through coarse screening and influent pumping. The screenings are to be transported to a disposal container/roll-off dumpster.

B. All equipment specified in this Section shall be suitable for installation in the structure as indicated. Any revisions necessary to accommodate the equipment furnished shall be the responsibility of the Contractor.

C. Related Work Specified Elsewhere:
   1. Contract Drawings.
   2. General Requirements: Division 1.
   3. Painting: Division 9.
   4. Motors: Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment

1.02 REFERENCES:

A. Applicable Standards:
   1. American Bearing Manufacturers Association (ABMA).
   2. American Gear Manufacturers Association (AGMA).
   3. American Iron and Steel Institute (AISI).
   4. American National Standards Institute (ANSI).
   5. American Society of Mechanical Engineers (ASME)
   6. American Society for Testing and Materials (ASTM):
      a. A36 - Structural Steel.
      b. A126 - Gray Iron Castings.
   7. National Electric Code (NEC)
   8. National Electrical Manufacturers Association (NEMA).
   9. National Fire Protection Association (NFPA).
   10. Occupational Safety and Health Act (OSHA).
   11. Underwriters Laboratories (UL).
   12. Institute of Electrical and Electronic Engineers (IEEE).

1.03 QUALITY ASSURANCE:

A. Refer to Division 1 for requirements.

1.04 SUBMITTALS:

A. Submit as specified in Division 1.

B. Includes, but is not limited to the following:
   1. Complete manufacturer's data, specifications, and detailed drawings for all equipment and materials which shall include complete descriptive data to define materials sizes, capacities, types, models, accessories, etc. Drawings and other information shall be suitable for erection and installation of equipment and materials.
   2. Recommended spare parts list.
   3. Electric power requirements, wiring diagrams, and schematics for all electrical equipment and devices.
   4. Control panel HMI screens.

5. All structural loads imparted to the structure.
6. Anchoring details.
7. Submit screen headloss calculations at peak and design flows. The calculations shall include clean screen 0% blinded and 30% of screen panel area blinded.
8. Manufacturer's surface preparation, shop priming, and machined metal surface rust inhibitive compound requirements.
9. List of installations, as described in Quality Assurance, including current Owner representative name, address, telephone number, and email.

C. Operation and Maintenance Manual includes, but not limited to, the following:
1. Special shipping, storage, protection, and handling instructions including dimensions of each container or package shipped.
2. Recommended unloading method at project site including implement (e.g., forklift, etc.) and maximum container or package weight.
3. Manufacturer’s printed installation instructions.
4. The manual shall be prepared specifically for this installation and shall include all required cuts, drawings, equipment lists, descriptions, etc. that are required to instruct operating and maintenance personnel unfamiliar with such equipment. The maintenance instructions shall include trouble shooting data, full preventative maintenance schedule and complete spare parts lists with order information. In addition, the manuals shall include the following at a minimum:
a. Complete parts list cross-referenced to an exploded view assembly or equivalent drawing.
b. Dimensional drawings of all provided equipment with component weights.
c. Complete preventative maintenance procedures (including recommended intervals).
d. Alignment, adjustment, and repair instructions.

D.

1.05 DELIVERY, STORAGE, AND HANDLING:

A. Deliver, store and handle all equipment and materials in accordance with the requirements in Division 1.

1.06 WARRANTY:

A. Shall be as specified in Division 1.

PART 2 - PRODUCTS

2.01 ACCEPTABLE SUPPLIERS:

A. Subject to compliance with the specifications, provide one of the following suppliers:
1. Screens and screenings washer/compactor:
a. Huber Technology Inc.
b. JWC Environmental.
c. Kusters Water, a Zima brand.
d. Parkson Corporation.
e. SAVECO North America, Inc.

2.02 SERVICE CONDITIONS:

A. The screening system shall be used to screen domestic wastewater that has been coarse screened and pumped from the collection system.

B. Screenings captured and collected from the screens are to be conveyed and deposited into a roll-off dumpster supplied by others.

2.03 DESIGN AND PERFORMANCE REQUIREMENTS:

A. Screens:
   1. Number of units: 2
   2. Maximum effective spacing: 6 mm
   3. Minimum Angle of screen: 60 degrees from horizontal

B. Washer/Compactors:
   1. Number of units: 2

C. Design Flows and Screenings Load:
   1. Peak flow per screen: 13.2 MGD
   2. Average daily plant flow: 4.6 MGD
   3. Minimum daily plant flow: 2.0 MGD

D. Dimensions and Elevations:
   1. Screen channel width: 4.0 feet.
   2. Screen channel depth: 6.0 feet (from operating floor to channel invert)
   3. Water level downstream at design average daily plant flow: 1.05 feet
   4. Water level downstream at peak flow: 1.75 feet
   5. Maximum allowable headloss at peak flow (at 30% blinding): 27 inches
   6. Channel bottom elevation: 932.50 feet.
   7. Screen Room operating floor elevation: 938.50 feet.
   8. Screening equipment supports shall be mounted on 6-inch concrete bases.

2.04 MECHANICAL PERFORATED PLATE TYPE SCREEN:

A. General:
   1. The screening of debris shall be accomplished by using a screen system comprised of a filter screen belt, rotating brush assembly, and drive unit.
   2. The screens shall be designed to be tilted out of the channel.

B. System Components:
   1. Screen Belt:
      a. Comprised of inclined, stainless steel, minimum 1/8-inch thick panel elements.
      b. The belt shall be continuous and travel in one direction within the screen frame.
      c. Clear spacing between adjacent panel elements, as measured in the horizontal direction, shall be 2.5 mm or less.
      d. A flange shall be provided, if required, on the bottom of each panel element to limit the separation at any point between adjacent elements to the thickness of the element material. Panel elements shall be interchangeable, one with the other.
      e. The screening rollers, if required, shall be minimum 1-3/4-inch diameter and shall ride on 1/2-inch thick type 304 stainless steel rails. A submerged, curved 1/2-inch thick stainless steel rail shall be provided at the foot of the screen. Alternatively, rotating guides may be provided to guide the chain and panel elements around the bottom of the screen.
      f. The screen shall be automatically self-cleaning through the interaction of the panel elements with or without external mechanical devices such as cleaner brushes. The driving force must be transmitted to clean, trash-free components to avoid mistracking or binding which render the screen inoperable and require manual cleaning and realignment. No auxiliary cleaning devices which cause trash to be dropped into the interior of the filtration belt will be allowed as this would tend to require periodic cleaning of trash from this area and may lead to jamming of the filtration belt.
   2. Rotating Brush Assembly:
      a. The screen belt assembly is cleaned by the interaction of the panel elements and the rotating brush assembly without other mechanical devices capable of jamming to remove the captured material.

b. The rotating brush assembly is supported by bearings on each side of the machine mounted externally to the machine frame. The brush is chain driven by the belt drive shaft or driven by a separate motor and gear reducer.
c. The brush is comprised of two separate components, the brush shaft, and the brush core. The shaft is made of stainless steel, type 304. The brush core is made of UHMW or PVC, with tufted nylon or polypropylene bristles.

3. Brush Drive Unit:
   a. The unit shall be driven by a 460 volt, 3-phase, 60 Hz TEFC motor connected to a reducer equipped with antifriction bearings and designed in accordance with AGMA recommendation for 24-hour, Class II service.
   b. The motor shall be rated for a service factor of 1.15, and operation with variable frequency drive. Motor shall conform to Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment.
   c. The motor shall be no larger than 2.0 hp and suited for operation in a Class I, Division 2, Group D.
   d. Provide electronic overload protection. Overload device shall sense motor current draw and provides overcurrent and jam protection.
   e. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
4. Frame Assembly:
   a. Screen frame shall be fabricated of type 304 stainless steel plate, minimum 3/16-inch thickness, and shall be provided with cross-bar supports as required to ensure a structurally sound assembly for the anticipated operation conditions.
   b. Frame shall be provided with floor-level baseplates.
   c. The tension of the moving screen belt assembly shall be completely supported by a stainless steel link chain. The chain must connect the shaft ends on both sides of the belt assembly so that no weight is supported by the panel elements. The chain assembly shall provide a minimum cross-section of 0.144 in^2 at the weakest point of any complete, individual link.
   d. The portion of the screen which is above the channel shall be fitted with minimum 14-gage covers constructed of type 304 stainless steel. The covers shall be removable for unobstructed access to the screening belt and any affected maintenance items.
   e. A discharge chute shall be provided integral to the machine to direct the screenings to the collection equipment below.
   f. A manual lubrication system shall be provided with lubrication lines and grease fittings extending from all grease points to a centrally located area accessible from the operating floor to facilitate lubrication of the equipment.
   g. All moving wetted parts, all wetted parts on which the moving parts ride, or all screen belt components under guiding, bearing or driving loads including, but are not limited to, the shafts, links, guide rails shall be fully corrosion-resistant and shall be made of type 304 stainless steel or wear-resistant heat treated 400 series stainless steel except as noted below or in specific descriptions:
      (1) The roller and bushings shall be of 400 series heat treated stainless steel with a minimum Rockwell of 39C hardness for reduced wear and long life.
      (2) The side seals shall be made of 304 stainless steel or neoprene rubber with type 304 stainless steel backing plates.
      (3) All nuts and bolts will be type 316 stainless steel.
      (4) The discharge chute shall be type 304 stainless steel.
      (5) The take-up screws shall be constructed of type 304 stainless steel.
      (6) The brush shaft shall be type 304 stainless steel.

5. Chain and Sprockets:
    a. Each screen panel shall be mounted to the stainless steel roller or box link type chains driven by stainless steel sprockets mounted on the drive shaft.
    b. The chains shall be roller or box link type with stainless steel side plates. The rollers (if applicable), pins and bushings shall be hardened stainless steel.
    c. The stainless steel drive shaft shall be supported on each side by grease lubricated take-up bearing assemblies.
    d. The chain shall be 304 stainless steel.
    e. Chain guides shall be secured to the screen frame for the full height of travel. A guide track or rotating sprocket shall also be located at the bottom of screen to allow the chain to travel from a downward to an upward direction. The chain guides shall accurately guide the chain and panels.
6. Screen Drive Unit:
    a. Provide motors and accessories as specified in Section 46 05 13.
    b. The unit shall be driven by a 460 volt, 3-phase, 60 Hz TEFC motor connected to a reducer equipped with antifriction bearings and designed in accordance with AGMA recommendation for 24-hour, Class II service.
    c. The motor shall be rated for a service factor of 1.15, and operation with variable frequency drive. Motor shall conform to Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment.
    d. The motor shall be no larger than 5.0 hp and suited for operation in a Class I, Division 2, Group D.
    e. Provide electronic overload protection. Overload device shall sense motor current draw and provides overcurrent and jam protection.
    f. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
7. Discharge Chute:
    a. An enclosed stainless steel discharge chute shall transport the discharge to a washer/compactor.
    b. The upper section of the discharge chute shall be hinged to allow complete access to the rotating brush assembly.SCREENINGS WASHER/COMPACTOR:

A. General:
1. The screw compactor shall be designed to dewater the screenings discharged from the screen and transport them to a screenings roll-off container. The dewatering screw compactor shall significantly reduce the volume of screenings, increase the solids content of the screenings, and reduce the overall weight of the screenings. The installed unit shall meet the EPA paint filter testing requirements when properly maintained and serviced.
2. Compactor Type: Shafted screw consisting of a sieve zone, wash zone, press zone, transport zone, discharge tube, drive system, and controls.
3. The washing operation occurs in a perforated plate underdrain section prior to the compaction section of the compactor. The spray system consists of a header, solenoid valves, and spray nozzles.
4. Operation: The washer/compactor is designed to be interlocked with the screen and will operate when the screen is operating.
5. Washwater shall be collected in a pan located beneath the screw trough and shall drain to screen channel by gravity.

B. Components:
1. Compactor Housing: The compactor housing shall be constructed of AISI Type 304 stainless steel and be a minimum of 11 gauge and connect to 3/8-inch flanges.
2. Augers: The shafted screw shall be manufactured from one concentric flight formed from carbon plate or hardened stainless steel and welded to form a single spiral. The

mechanical tubing shall be welded to an end shaft. The shafted screw diameter shall be 7.5-inches minimum.

3. Discharge Tube: The discharge tube shall be cylindrical and constructed of minimum 14 gauge AISI Type 304 stainless steel. The discharge tube shall increase in diameter over its length in order to reduce the potential for plugging. The discharge tube shall direct and discharge screenings at a maximum clear discharge height of 4 feet.
4. Hood Position Switch: The position switch shall be interlocked with the main control panel to prevent equipment operation when hood is not in position.

1. Motor: The electric motor shall be TEFC, NEMA Design B with Class F insulation, rated for Class I, Division 2, Group D hazardous environment. The motor shall be rated for 460-volt, 3 phase, 60-hertz operation, service factor of 1.15, and operation with variable frequency drive. Motor shall conform to Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment.
    a. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
5. Gear Reducer: The design shall utilize a shaft mounted, helical type gear reducer driven by a direct coupled motor. The reducer shall have a cast iron housing and shall have a maximum output of 14 rpm. Service factor shall be a minimum of 1.0.
6. Spare Parts and Special Tools:
    a. A minimum of one standard spare parts package shall be provided which includes the following as applicable to the unit furnished:
        (1) One set of special tools required for maintenance.

2.06 PROTECTIVE COATINGS:

A. Motor, gear reducer, and all metallic surfaces except aluminum and stainless steel shall be factory painted with the Manufacturer's standard coating equal to the 09 90 00 "E-1" system and field touched-up as specified in Division 9.
B. Coatings other than those listed in Division 9, System "E-1" may be submitted but must receive the approval of the Purchaser.
C. Provide field touch-up paint kit.

2.07 SCREEN SYSTEM CONTROLS:

A. The Screen System shall be supplied with a main system control panel designed to house all components required to control the screen system.
B. System Components and Function:
    1. Screen System Main Control Panels (GRSC-MCP-100 and GRSC-MCP-200)
        a. As described below
    2. Fine Screens GRSC-SCR-110 and GRSC-SCR-210
        a. Mechanical screens designed to remove solids and debris from the liquid stream.
    3. Brush Drives GRSC-BR-115 and GRSC-BR-215
        a. Brush designed to remove material from screen.
    4. Deflector Roller Drives (if required) GRSC-DR-116 and GRSC-DR-216
        a. Deflector designed as a safety feature to remove stringy material, such as rags that may cling to panel lifting tines.
    5. Level Transducer GRSC-LE-100A and GRSC-LE-200A
        a. Ultrasonic level transducer for measuring fine screens GRSC-SCR-110 and GRSC-SCR-210 upstream level.
    6. Level Transducer GRSC-LE-100B and GRSC-LE-200B
        a. Ultrasonic level transducer for measuring fine screen GRSC-SCR-110 and GRSC-SCR-210 downstream level.

7. Level Transmitters GRSC-LIT-100 and GRSC-LIT-200
    a. Ultrasonic level transmitter for measuring fine screen GRSC-SCR-110 and GRSC-SCR-210 upstream and downstream levels. The transmitter shall monitor signals from the associated screen system transducer and provide analog level signals for each to the main control panel.
8. Level Switches GRSC-LSH-100 and GRSC-LSH-200
    a. Conductivity point level switch to provide a high level alarm for fine screen GRSC-SCR-110 and GRSC-SCR-210 located in the fine screen influent channel.
9. Temperature Switches GRSC-TSH-110 and GRSC-TSH-210
    a. Temperature switch to provide a high temperature alarm for fine screens GRSC-SCR-110 and GRSC-SCR-210.
10. Washer/Compactors GRSC-WC-120 and GRSC-WC-220
    a. Washes and separates solids and compacts materials for transport and disposal with discharge into the screening dumpster

C. Description of Operation:
1. The screening equipment shall be provided with a manufacturer supplied control panel equipped with a PLC and an operator interface for setpoint adjustment as specified in Section 40 67 00 – Process Control Panels and Hardware.
2. The system shall have a control panel provided and mounted at the indicated location to allow for local operation of the equipment.
3. The manufacturer supplied control panel shall serve as the primary control point for the equipment and all controls described shall be available through an operator interface screen (HMI).
4. A System Inhibit signal shall be provided to each main control panel from the Plant Control System. The signals shall be communicated via the Ethernet/IP network. If an inhibit signal is received, all associated system equipment shall be prevented from running.
5. Fine Screen GRSC-SCR-110 and GRSC-SCR-210
    a. The screen shall be started and stopped at the HMI by Hand/Off/Auto operation selection.
        (1) In HAND mode, the equipment will run continuously until stopped by the operator.
        (2) In OFF mode the equipment will not run.
        (3) In AUTO mode, the equipment will be started and stopped by the screen system PLC. The PLC programming shall be as described below.
            (a) The screen shall be started and stopped by the system PLC based upon channel head differential across the screen as measured by the corresponding level transmitters.
            (b) The screen system shall start when the calculated differential level reaches differential level setpoint. An operator adjustable level differential setpoint shall be programmed.
            (c) The screen will operate at high speed if the level reaches the high-speed differential level setpoint. The screen will continue to operate at high speed until the differential level falls below the differential level setpoint.
            (d) The screen system shall operate continuously until the differential level falls below the differential level setpoint. The screen system shall then operate for an operator adjustable length of time before stopping.
            (e) A backup timer shall be provided to operate the screen periodically and if a failure occurs with the level controls, the timer setpoint shall be adjustable through the operator interface mounted on the face of the main control panel.

(f) The parameters for the channel head differential and cycle time between operations shall be set at the manufacturer provided operator interface on the main control panel.

(g) A "CYCLE START" operator soft push button shall be provided on the face of the local control panel. If the CYCLE START push button is depressed, the PLC shall immediately initiate a screen cycle for the associated screen.

(4) The brush system shall operate in tandem with the screen in all modes of operation.

b. Refer to System Upsets and Procedures for Recovery section for additional programming requirements.

c. The upstream and downstream levels for each of the screens shall be available for display on the operator interface in units of feet. An operator adjustable level differential alarm shall be programmed for the screen.

6. Washer/Compactors GRSC-WC-120 and GRSC-WC-220

a. The washer-compactor shall be started and stopped at the HMI by Hand/Off/Auto operation selection

(1) In HAND mode, the equipment will run continuously until stopped by the operator.

(2) In OFF mode, the equipment will not run.

(3) In AUTO mode, the washer/compactor will be interlocked with the operation of the screen as described below:

(a) The screen system control panel shall start the washer/compactor when the screen starts.

(b) During normal flow conditions, the washing press shall be operated in a forward and reverse sequence via the main control panel's PLC. The screenings will be transported into the washing zone where the screw shall stop rotation.

(c) During peak loading conditions, the washing process shall automatically switch to operate in the forward direction to handle the larger amount of screenings with only short intervals of reversing to ensure that material does not accumulate on the shaft of the screw.

(d) Solenoid valves providing the wash water for the washer/compactor shall be operated by the manufacturer's control system when the equipment is in operation. The screen system main control panel shall operate the washer/compactor continuously until a configurable delay time after the fine screen stops running. This is to ensure complete separation and disposal of screened material.

(e) The compactor may optionally operate independent of the screen system as specified by the manufacturer.

b. Refer to System Upsets and Procedures for Recovery section for additional programming requirements.

c. The status points and alarms shall be displayed on the plant control system operator workstations for each screen. Alarm and status setpoints shall be communicated to the plant control system via the Ethernet/IP network.

7. Remote Control Stations:

a. The system (Screen and Washer/Compactor) shall be remotely controlled by a control station with an Hand/Off/Auto switch for each motor and valve that provides the following control:

(1) In Hand Mode, the equipment (screen, brush, and compactor) shall run.

(a) While in Hand Mode, the Washer/Compactor will operate in the direction selected by the Forward/Off/Reverse selector switch.
(2) In Off Mode, the equipment (screen, brush, and compactor) will not run.
(3) In Auto Mode, equipment operation will be based off the mode set in the HMI.

b. Remote indication shall reflect screen run/stop status.

D. Setpoints and Ranges:
1. Level Transducer GRSC-LE-100A and GRSC-LE-200A:
a. Ultrasonic level transducer provided by the screen system supplier.
b. Refer to 40 70 00 Instrument List for calibration Ranges.
2. Level Transducer GRSC-LE-100B and GRSC-LE-200B:
a. Ultrasonic level transducer provided by the screen system supplier.
b. Refer to 40 70 00 Instrument List for Calibration Ranges.
3. Level Switch GRSC-LSH-100 and GRSC-LSH-200:
a. Submersible level switch provided by the screen system supplier.
b. Refer to 40 70 00 Instrument List for Calibration Ranges.
4. Screen System Operator Interface:
a. Screen Level Transducers (GRSC-LE-100A, GRSC-LE-200A, GRSC-LE-100B, GRSC-LE-200B)
(1) Display range of 0-6 feet for each level transmitter.
(2) High level alarm adjustable between 0-5.5 feet, initially set at 4.0 feet for the upstream level transmitter.
(3) Differential level setpoint adjustable between 0.25-2.00 feet, initially set at 0.5 feet for each screen.
b. Backup cycle timer adjustable between 0-30 minutes, initially set at 15 minutes.
c. Washer/Compactor off delay timer adjustable between 0-300 seconds, initially set at 30 seconds

E. System Upsets and Procedures for Recovery:
1. The system shall send an alarm for the screen to the Process Control System under any of the following conditions:
a. Any motor or other component critical to the operation of the screen or compactor is faulted.
b. If a level transmitter signal is lost.
c. If a jam is not cleared.
2. If a power failure occurs, the equipment that was in operation prior to the power failure shall be automatically restarted by the manufacturer provided main control panel without requiring a manual reset.
3. Failure of a screen shall not inhibit the operation of the washer/compactor.
4. If an overload occurs in the screen or washer/compactor, the respective equipment shall automatically stop and initiate and failure alarm at the operator workstation.
5. System in AUTO mode:
a. If a level signal is lost, the screen shall operate on a timer. If the level signal is restored, the screen shall be returned to normal operation.
6. Safety Devices:
a. Emergency stops shall be interlocked with all motor circuits in the screen and compactor system.
b. In the event of an emergency stop situation, the equipment will shut down and alarm the operator via the operator workstation.
c. The system shall not restart until the operator clears the alarm from the equipment and/or the main control panel as applicable.

(1) The emergency stop pushbuttons and pull cord require a manual reset to deactivate the alarm.

F. The screening equipment supplier shall provide all control components and instruments as specified herein.

G. Screen System Control Panel:
1. Control panels and components shall conform to Section 40 67 00.
2. The control panel shall be a NEMA 12 free standing mild steel enclosure and be installed in the Electrical Room separate from the screening units.
3. The control panel shall be equipped with an Allen-Bradley CompactLogix PLC to provide control and monitoring of the supplied equipment.
4. The manufacturer supplied PLC shall be connected to the Plant Control System through an Ethernet network connection. Provide network switch and communications card as required for communicating the Screen system data over an Ethernet/IP network. The panel programmer shall provide a data/memory map to the project's systems integrator which includes all produced tags and assigned IP addresses as required to enable communication between the control panel and the communication network.
5. IP address assigned to PLC for uplink to plant network shall be reconfigurable and on a separate subnet than the Screen System's local network.
6. The control panel shall be powered from a single 480V, 3-phase power source.
7. The control panel shall be supplied with a 480-120V control power transformer to provide power to 120V devices in the panel.
8. The control panel shall include provisions for connection of one (1) 120Vac, 20-Amp field supplied circuit and the internal derived 120Vac circuit from the specified 480V-120V CPT. The CPT derived circuit shall be used as "House" power for lights, fans, receptacles, etc. The field connected circuit shall be derived from the centralized UPS system and shall power all PLC, network, OIT, and control system related loads within the control panel.
9. The control panel shall contain all required components for complete control and monitoring of the screening units, compactors, level controls and other associated equipment. As a minimum, the following components shall be installed in the panel:
   a. Door interlocked main disconnect circuit breaker.
   b. Motor starters with solid state overloads and/or VFD's for the screen units and washer/compactors.
   c. Control power transformer.
   d. Programmable Logic Controller (PLC).
   e. Operator interface touch screen.
   f. Required circuit breakers, control relays, power supplies, selector switches and indicating lights.
10. Operator Interface Touch Screen:
   a. The control panel shall include a 15-inch operator interface touch screen.
   b. Provide Allen-Bradley PanelView Plus 7 series as specified in Section 40 67 00.
   c. All manufacturer supplied graphics and applications shall be developed with FactoryTalk View Machine Edition.
   d. The screens developed shall utilize high performance graphic styles using gray scale color palettes for all equipment when possible.
   e. In addition to controlling the Manufacturers equipment the supplied touch screen shall be used for interfacing with the Plant Control System. Manufacturer shall provide the developed screen system application files to the Systems Integrator to allow further development and addition of the screens.
   f. Manufacturer shall provide the necessary coordination with the Systems Integrator to ensure a fully functional application.

11. Jam Protection for the Screening Units:
    a. Jam protection shall be provided for the screening units.
12. All devices shall be factory installed, wired and tested. Terminal blocks shall be provided and labeled as required for power, control and instrumentation.
13. The Screen System Control Panel shall provide the following discrete output signals for use by the Plant Control System. The signals shall be communicated via the Ethernet/IP network.
    a. Screen "Auto" Mode.
    b. Screen "Hand" Mode.
    c. Screen Run Status.
    d. Screen High Speed Status.
    e. Screen Emergency Stop.
    f. Screen Failure (Common alarm for all equipment associated).
    g. Screen Overtemperature Alarm.
    h. Brush Drive "Auto" Mode.
    i. Washer/Compactor "Hand" Mode.
    j. Brush Drive Run-Forward Status.
    k. Brush Drive Run-Reverse Status.
    l. Brush Drive Failure (Common alarm for all equipment associated with Wash/Compactor).
    m. Brush Drive Overtemperature Alarm.
    n. Washer/Compactor "Auto" Mode.
    o. Washer/Compactor "Hand" Mode.
    p. Washer/Compactor Run-Forward Status.
    q. Washer/Compactor Run-Reverse Status.
    r. Washer/Compactor Emergency Stop.
    s. Washer/Compactor Failure (Common alarm for all equipment associated with Wash/Compactor).
    t. Washer/Compactor Overtemperature Alarm.
    u. Screen High Level Switch status
14. The Screen System Control Panel shall provide the following analog outputs over the Ethernet/IP network for use by the Plant Control System.
    a. Screen Influent Level.
    b. Screen Effluent Level.
    c. Screen Differential Level.
15. As a minimum the following functionality shall be available via the operator interface screen:
    a. Hand/Off/Auto switches for each piece of equipment.
    b. Power On indicating light for each piece of equipment.
    c. Forward indicating lights for each piece of equipment.
    d. Reverse indicating lights for applicable equipment.
    e. Fault or Failure indicating lights for each piece of equipment.
    f. Motor overtemperature indicating light for each motor.
16. Additional status points and adjustment of set points and operating parameters shall be available via the operator interface screen. As a minimum, the following parameters and status points shall be viewable and/or adjustable via the operator interface screen:
    a. Screen Head Differential.
    b. Screen Head Differential Set Point.
    c. Screen High Speed Set Point.
    d. Backup Timer Setting.
    e. Jam protection current set point.

f. Run Time.
g. Run Status indication for all equipment.
h. Identify cause of equipment Failure.

H. Screening Unit Local Control Station GRSC-CST-110 and GRSC-CST-210:
1. Refer to Section 40 67 00 for panel requirements and component specifications.
2. The panel shall be a NEMA Type 4X 304 SST enclosure to be installed in an interior unconditioned area. All selector switches, pushbuttons, and indicators shall be hermetically sealed for installation in a Class I, Division 2, Group D area.
3. Refer to Section 40 67 00 – Process Control Panels and Hardware for panel requirements and component specifications.
4. The panel shall contain all required components to implement the control functionality specified and allow for the electrical connection of the skid mounted equipment to the main control panel. As a minimum, the following components shall be installed in the face of the panel:
   a. Screen:
      (1) Hand/Off/Auto selector switch.
   b. Brush Drive:
      (1) Hand/Off/Auto selector switch.
      (2) Forward/Off/Reverse selector switch. Switch shall be spring return from "Reverse" to "Off" and manual return from "Forward" to "Off".
   c. Solenoid Valve:
      (1) Open/Close/Auto selector switch.
   d. Emergency stop pushbutton.
   e. Control Station Identification Label.
5. As a minimum the following shall be installed inside the panel.
   a. Terminal blocks for all field connections required.

I. Screen Level Sensors:
1. The screening units shall be provided with ultrasonic level transducers and transmitters. The level transmitter level signals shall initiate screen operation based on channel head differential and the parameters set in the operator interface.
   a. The PLC logic shall determine differential levels using signals from two separately mounted ultrasonic transducers to a shared transmitter.
   b. The first transducer shall be installed upstream of the screen and measures the screen upstream head. The second transducer shall be installed downstream of the screen and measures the downstream head of the screen.
   c. The head in front (upstream) of the screen shall be compared to the head downstream of the screen to determine the head differential.
2. Level Transmitter GRSC-LIT-100 and GRSC-LIT-200:
   a. Provide a level transmitter mounted for each screening unit.
   b. The upstream and downstream transducers' 4-20mA level signal instrumentation cables shall terminate to the transmitter. The transmitter shall provide upstream and downstream levels to the main control panel via 4-20mA outputs. The transmitter shall display upstream, downstream, and differential level.
   c. The transmitter shall be rated for installation in a Class I, Division 2, Group D area. The transmitter shall provide intrinsically safe connections for the level transducers.
   d. Power for the level transmitter shall be provided from the main control panel via thermal magnetic circuit breaker.
3. The ultrasonic transducers shall be a 2-wire device and perform non-contacting liquid level measurements with signal outputs of 4-20mA to the screen system PLC via a shared transmitter.

4. The ultrasonic transducers shall be intrinsically safe and suitable for installation in a Class I, Division 2, Group D area. Required intrinsically safe barriers shall be installed in the transmitter enclosure.
5. Provide the required stainless-steel mounting hardware to allow mounting directly above, and centered in, the channel. Flanged connection shall be provided and allow for the installation of the transducer centered between the channel walls. Installation shall be coordinated with channel grating to allow access and removal. Refer to contract drawing for mounting details.
6. Refer to Section 40 70 00 for ultrasonic elements and transmitter specifications.
7. High Level Probe:
    a. Provide a high-level conductivity probe for installation in each channel, upstream of each screen.
    b. The probes shall be intrinsically safe and suitable for installation in a Class I, Division 2, Group D area. Where required, provide and install intrinsically safe barriers in the main control panel.
    c. Provide and install an intrinsically safe control relay for each probe in the main control panel. Relay shall provide an alarm to the PLC via a N.O. and N.C. output contact upon high level detection by probe.
    d. Provide the necessary stainless steel hardware, mounting brackets or fittings, manufacturer cables, and strain relief for securing the probes in the channel. Installation shall be coordinated with the channel grating to allow access and removal.
    e. Refer to Section 40 70 00 – Instrumentation for Process Systems for conductivity probe specifications.

J. Emergency Stop Switches:
1. The Washer/Compactor shall be equipped with an emergency stop safety switch pull cord; with two normally closed double break contacts.
    a. Contacts shall be manually reset.
    b. Switches shall be equipped with a latching mechanism, a weight and cable along the length of the screw conveyor for operation of the switch.
    c. Switches shall be opened by cable linkage mounted on all sides of the conveyor. Cables shall be plastic covered stainless-steel cable (orange color) and located within easy reach of operating personnel.
    d. NEMA 4X enclosure suitable for installation in a Class I, Division 2, Group D area.
    e. Shall be suitable for installation in a Class I, Division 2, Group D area.
    f. The screen equipment shall include the necessary brackets, cable eyes, and other necessary hardware required to mount the switch and pull cord to the unit.

K. Washer/Compactor Local Control Station GRSC-CST-120 and GRSC-CST-220:
1. Refer to Section 40 67 00 for enclosure requirements and component specifications.
2. The control station shall be a NEMA type 4X 304SS enclosure to be installed in an interior unconditioned area. All selector switches, pushbuttons, and indicators shall be hermetically sealed for installation in a Class I, Division 2, Group D area.
3. The control station shall contain all required components to implement the control functionality specified and allow for the electrical connection of the skid mounted equipment to the main control panel. As a minimum, the following components shall be installed in the face of the panel:
    a. Washer/Compactor:
        (1) Hand/Off/Auto selector switch
        (2) Forward/Off/Reverse selector switch. Switch shall be spring return from “Reverse” to “Off” and manual return from “Forward” to “Off”.
    b. Solenoid Valves:

(1) Open/Close/Auto selector switch for each associated wash valve.

c. Control Station Identification Label.

L. Source Quality Control:
1. The Screen System and controller shall be factory tested to ensure satisfactory operation.

M. Accessories:
1. Provide all templates and special wrenches or tools necessary for proper installation and maintenance of equipment.

N. Spare Parts:
1. The following spare parts shall be supplied for the supplier supplied control panel:
a. One spare LED indicating lamp for each type and color used.
b. One spare indicating light assembly.
c. Five spare control fuses of each voltage and current rating used.
d. One spare relay and base for each type used.

PART 3 - EXECUTION

3.01 PREPARATION:

A. Motor, gear reducer, and all metallic surfaces except aluminum and stainless steel shall be factory painted for shipping purposes. Stainless steel and aluminum surfaces shall not be painted. Prepare surfaces in shop and finish all surfaces as specified in Division 9.

B. Store all Equipment as specified in Division 1 and as required to prevent damage.

C. Assemble and test drive units in factory.

3.02 INSTALLATION:

A. In accordance with manufacturer's instructions and as indicated.

B. Install all electrical conduits, wires, tubing, instrumentation and other appurtenances as required for satisfactory operation.

C. Prepare surface and paint or touch up all surfaces as specified herein and in Division 9.

3.03 FIELD QUALITY CONTROL AND ADJUSTMENTS:

A. Manufacturer's Field Services: Provide all services as specified in Division 1 and as follows:

B. The equipment suppliers shall furnish the services of a factory-trained representative on site for a period of no less than four days and two trips. The representative shall inspect, adjust, calibrate and place the system into operation. If additional services are required to produce a fully operational system, they shall be provided at no cost to the Owner.

C. Training:
1. The on-site services provided by the factory-trained representative shall include training.
2. The representative shall provide two complete training sessions to the Owner operating personnel in equipment operation and maintenance. Sessions shall be a minimum of two hours in length, or as required to complete the entire training.
3. One of the sessions shall be video recorded, placed on a USB, and transmitted to Owner for use in training future personnel.

D. After installation and after all equipment and components are in operable condition, a field mechanical and electrical performance test shall be performed in the presence of the Engineer.
1. Each piece of equipment shall be tested for normal start, stop, and emergency stop cycles.
2. Each piece of equipment shall be field tested and the equipment calibrated to demonstrate to the Engineer that all equipment will satisfactorily perform the functions and criteria specified.
3. Furnish test forms and procedures for field testing and provide all test apparatus required at no additional cost to the Owner.

4. Follow testing procedures recommended by the equipment manufacturer and approved by the Engineer.
5. The equipment supplier shall modify or replace any equipment necessary to obtain satisfactory performance.

E. All labor, materials, and test apparatus necessary for conducting the above tests shall be furnished by the Contractor at no additional cost to the Owner, unless stated otherwise.

END OF SECTION 46 21 13

SECTION 46 23 00 – GRIT REMOVAL AND TREATMENT EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY

A. This Section includes the supply, delivery, installation, and commissioning of one (1) grit removal unit, one (1) horizontal vortex-type slurry pump, one (1) uninstalled complete shelf spare pump, and one (1) grit washing/classifying/dewatering unit as specified herein.

B. Related Work Specified Elsewhere.
   1. General Requirements: Division 1.
   2. Concrete Anchors: Section 05 05 19.
   3. Protective Coatings: Division 9.
   4. Process Control Panels and Hardware: Section 40 67 00.
   5. Common Motor Requirements for Water and Wastewater Equipment: Section 46 05 13.

   10. American Iron and Steel Institute (AISI).

1.03 SUBMITTALS:

A. Submit as specified in Division 1.

B. Technical Submittal includes, but not limited to, the following:
   1. Complete manufacturer’s data, specifications, and detailed drawings for all equipment and materials, which shall include complete descriptive data to define materials, sizes, capacities, types, models, accessories, etc. Drawings and other information shall be suitable for erection and installation of equipment and materials.
   2. General arrangement drawing of pump, motor and base with proposed equipment data highlighted. Manufacturer shall submit a statement indicating that the proposed installation is in compliance with HI and manufacturer requirements.
   3. All submittal data shall be labeled in English units. All Drawings shall be drawn to scale, and text shall be in English.
   4. Technical description of equipment.
   5. All structural loads imparted onto the structure.
   6. Anchor bolt design calculations sealed by a Professional Engineer licensed in the state of Missouri.
   7. Potable and/or non-potable water requirements.
   8. Catalog bulletins describing construction, dimensional sketches, equipment weights, list of materials used for construction and performance data for the grit classifier.
   9. Manufacturer’s surface preparation, shop priming, and machined metal surface rust inhibitive compound requirements.
   10. List of installations, as described in Quality Assurance, including current Owner representative name, address, telephone number, and fax number.

11. Control schematics and wiring diagrams for power, control, and instrumentation that clearly indicate factory and field wiring requirements. All field wiring shall terminate on terminal blocks clearly marked with identification matching control schematics.
12. Electric power requirements, wiring diagrams, schematics and datasheets for all electrical equipment and devices.
13. Panel layout including dimensions, bill of materials, and catalog data sheets. Provide power and control wiring diagrams and schematics to clearly show factor and field wiring.
14. Touch screen graphics (for each piece of grit removal system equipment) subject to Engineer approval.
15. Control wiring diagram showing wiring into and out of the control panel and terminal landing points.
16. Functional description of internal and external instrumentation and controls to be supplied including list of parameters monitored, controlled, and alarmed.
17. Refer to Section 40 67 00 for additional submittal requirements pertaining to control panels.
18. Refer to Section 46 05 13 for additional submittal requirements pertaining to motors.
19. Recommended spare parts list.
20. Standard performance curves for pump model furnished. Curves shall cover range from shutoff to 120 percent of design flow rate at the conditions specified, and shall be submitted for the following parameters as a function of pump capacity and speed at design temperature:
    a. Total developed head.
    b. Required brake horsepower.
    c. Pump efficiency.
    d. Required NPSH.
    e. Minimum recommended submergence.
21. Mechanical details including impellers, bearings, couplings, and seals.
22. Manufacturer's standard protective coating system.
23. Motor performance data and results of shop test.
24. Pump nameplate data.
25. Motor nameplate data.
26. Weights:
    a. Total each unit.
    b. Pump.
    c. Motor.

C. Operation and Maintenance Manual includes, but not limited to, the following:
1. Special shipping, storage, protection, and handling instructions including dimensions of each container or package shipped.
2. Recommended unloading method at project site including implement (e.g., forklift, etc.) and maximum container or package weight.
3. Manufacturer's printed installation instructions.

D. Certifications:
1. Manufacturer's Certificate of Proper Installation.
2. Field mechanical test procedures.
3. Submit complete, signed report of results of field inspection, operation, adjustments, and tests. Include the Manufacturer's certificate that the equipment is ready for permanent operation and that nothing in installation will affect Manufacturer's warranty in any manner, or render warranty null and void.

1.04 DELIVERY, STORAGE, AND HANDLING MATERIALS:

A. Equipment shall be shipped pre-assembled to the degree that is practicable.
B. Manufacturer shall provide storage instructions indicating specific requirements to ensure there is no damage to or deterioration of components.

1.05 QUALITY ASSURANCE:

A. All items of equipment specified herein shall be furnished by one Manufacturer. This Manufacturer shall have the responsibility of providing the equipment, accessories, installation supervision, and testing services required to provide a functioning system.
B. Like items of equipment provided hereunder shall be the products of one Manufacturer in order to achieve standardization for appearance, operation, maintenance, spare parts, and Manufacturer's service.
C. Products used in the Work of this Section shall be produced by the Manufacturer regularly engaged in the manufacture of equipment of this type.

1.06 WARRANTY:

A. As specified in Section 01020 – Record Documents and herein.
B. The Manufacturer shall warrant that all Equipment shall be free of defects caused by faulty material or workmanship and shall replace those parts for at least a period of one (1) year from the date of start-up.
C. Multiple warranties for individual components shall not be acceptable.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. The following Manufacturers are acceptable and the minimum equipment requirements that are allowed to meet the specified performance include:
    1. Grit Concentrator unit:
        a. Hydro International, HeadCell® grit removal unit
    2. Grit Pump:
        a. Gorman Rupp.
        b. Hayward Gordon.
        c. ITT Goulds.
        d. Wemco.
        e. Engineer approved equal.
    3. Grit Washer/Classifier unit:
        a. Hydro International, OpTeaCup® grit washing/classification unit
    4. Grit Dewatering unit:
        a. Hydro International, Grit Snail® grit dewatering unit
B. Manufacturers shall provide projects of similar size for municipal wastewater applications and shall furnish performance test results documenting that the System has achieved the specified performance requirement. Performance test reports must clearly show the performance of the entire grit removal system, including grit washing and/or dewatering units.

2.02 GENERAL REQUIREMENTS

A. Screened raw wastewater will continuously flow by gravity into the Grit Concentrator.
B. Nonpotable water shall be supplied and distributed to the Grit Concentrator fluidizing line. Manufacturer to provide nonpotable water valves and accessories.

C. Grit slurry from the Grit Concentrator shall be pumped to the Grit Classifying and Handling System continuously. Manufacturer to provide one (1) grit pump specifically designed to pump slurries of grit, debris, and organic solids without clogging and one (1) uninstalled shelf spare. De-gritted effluent will flow by gravity into the AGS Basins.
D. Each grit concentrator unit shall be placed in a concrete tank and receive the incoming screened flow. The grit concentrator shall provide sufficient surface area to remove the specified grit particles from the specified peak flow and concentrate the grit in a sump at the bottom of the unit.
E. The Grit Removal and Treatment Equipment and all appurtenances shall be supplied by a single Manufacturer.
F. The Grit Removal and Treatment Equipment shall include all equipment shown on the Contract Drawings and as specified herein. The system shall include, but not be limited to the following equipment:
    1. Grit Concentrator unit, stainless steel inlet connection and distribution header, stainless steel grit slurry underflow collector, and grit sump.
    2. Grit Classifier unit, flanged inlet and outlet connections.
    3. Grit Dewatering unit, stainless steel settling compartment, stainless steel housing, drive unit and motor, belt, rinse spray system, integrated controls and instrumentation, and programming.
    4. PLC, with OIT, based Control Panel.
    5. All items necessary for complete assembly.
    6. All appurtenances and safety devices required for proper operation.
    7. Lubricants (if required) for start-up procedure specified.
    8. Tool storage cabinet for any special tools required for operation and maintenance.
    9. Spare parts as required for the complete installation and operation of the system.
G. The Grit Classifier shall be designed to separate the grit collected from the Grit Concentrator unit.
H. The Grit Dewatering unit shall be designed to dewater grit from the Grit Classifier and thus reduce the volume and moisture content.
I. All Equipment shall be delivered completely assembled or in convenient sections as permitted by common carrier and required for installation.
J. All Equipment shall be designed and built for 24-hour intermittent or continuous service and for moderate shock without overheating, excessive vibration or strain.
K. The Grit Classifier and dewatering unit shall be constructed of 304 stainless steel.
L. All bolts, nuts, and washers shall be 304 stainless steel.
M. All electrical Equipment that is located in the Process Building shall be rated for installation in a Class 1, Division 1, Group D area; all such equipment shall be rated appropriately for installation in a classified space.
N. The control panel will be installed remotely from the grit equipment in an unclassified space.
O. The grit pumps shall be specifically designed to pump slurries of grit, debris, and organic solids without clogging.
P. The pumps shall be furnished complete with pump casings, shafts, bearings, mechanical seals, lubrication, motors, controls, and all other parts and accessories indicated, specified, or required for proper installation, operation, and maintenance.
Q. Pumps shall be capable of pumping settled grit containing 1% coarse solids.
R. All internal passages, impeller vanes, and recirculation ports shall all pass a 3.0-inch diameter solid.
S. Provide pump capable of operating continuously for extended periods of time without damage.
T. Pump shall operate at 80 to 120-percent of the best efficiency point.

U. The pump head-capacity curve shall be continuously falling from shutoff head.
V. Pump shall be easily removable for inspection or service.
W. Pump rotating assembly, which includes impeller, shaft, mechanical shaft seal, lip seals, bearings, sealplate, and bearing housing, must be removable as a single unit without disturbing the pump casing or piping.
X. Pump mounting feet shall be sized to prevent tipping or binding when pump is completely disassembled for maintenance.
Y. Pumps shall be specifically designed to both optimize wear resistance and maintain hydraulic performance as wear occurs.
Z. The pump's head vs. capacity curve shall slope upward toward shutoff in one continuous curve with no points of inflection capable of causing hunting at any pump operational speed.
AA. Pump(s) shall be equipped with slotted raised face flanges to receive 125 lb. standard bolting. Special case slots shall be cast in to retain bolts and to fasten the case to the bearing housing and to the intake for easy case removal.

2.03 DESIGN REQUIREMENTS:

A. The Equipment furnished shall be designed to classify, wash, and dewater grit from screened wastewater at a peak flow rate of 13.2 MGD. Screened wastewater will be pumped to the grit removal system. The washed grit will be collected in a dumpster, at the ground level in the Headworks Building. Processed effluent will continue by gravity to the AGS Basins.
B. The Grit Concentrator unit shall be placed in a concrete tank and receive the incoming screened flow. The Grit Concentrator shall provide sufficient surface area to remove the specified grit particles from the specified peak flow and concentrate the grit in a sump at the bottom of the unit. The de-gritted effluent from the Grit Concentrator shall be weir discharged.
C. The design parameters to be used for design of the Grit Removal and Treatment Equipment include:
    1. Design Flows:
        a. Avg Day Flow: 4.6 MGD
        b. Peak Hourly Flow: 13.2 MGD
    2. Grit Concentrator (see drawings for additional dimensions):
        a. Location of Grit Concentrator: Adjacent to the Headworks Building, as shown on the drawings.
        b. Number of Grit Concentrators: 1
        c. Diameter: 12 feet
        d. Number of Trays per Unit: 7 (expandable to 9)
        e. Maximum Head Loss at Peak Flow: 12 inches
        f. Maximum Head Loss at Avg Day Flow: 2 inches
        g. Length of Effluent Weir: 10 feet
        h. Location of Grit Discharge: Underflow outlet to Grit Pump in the Headworks Building.
        i. Location of Grit Pump: Headworks Building, as shown on the Drawings.
    3. Grit Pumps:
        a. Pump, motor, and sheave assembly shall be designed for the following:
            (1) Number of pumps: 2 (1 duty/1 shelf spare)
            (2) Design Capacity at Maximum Flow and Head: 200 gpm
            (3) Minimum Efficiency at 100% Speed: 50%
            (4) Total Dynamic Head: < 10 ft
            (5) Shutoff Head (minimum): 30 ft
            (6) Shutoff Head (maximum): 37.5 ft

(7)	Maximum Motor Speed:	1200 rpm
(8)	Maximum Motor Horsepower:	7.5 hp
(9)	Suction Diameter:	4 inches
(10)	Discharge Diameter:	3 inches

4. Grit Classifier Unit:
   a. Location of the Grit Washer/Classifier Unit: Process Building, as shown on the Drawings.

b.	Number of Units:	1
c.	Size:	24" diameter
d.	Performance:	95% removal of all grit Specific gravity 2.65 ≥ 75 microns at design flow
e.	Influent Solids Concentration:	≤ 1.0%
f.	Design Flow/Unit:	200 gpm with 27” of maximum headloss
g.	Influent Connection:	4” flanged pipe
h.	Effluent Connection:	8” flanged pipe
i.	Underflow Connection:	3” flanged pipe
j.	Material of Construction:	304 SS
k.	Operation:	Continuous / Intermittent minimum 10-15 minutes

5. Grit Dewatering Unit:

a.	Number of Units:	1
b.	Maximum Grit Load:	1.0 yd^3/hr
c.	Performance:	95% removal of all grit Specific gravity 2.65 ≥ 75 microns
d.	Belt Width:	6"
e.	Clarifier size:	48" square
f.	Min. Free Water Surface area:	10 ft^2
g.	Overflow Connection:	6" flanged pipe
h.	Drain Connection:	3" flanged pipe
i.	NPW Connection:	1" NPT
j.	Body Material:	304 SS
k.	Belt Material:	Neoprene Rubber, re-inforced with Polyester

2.04 GRIT CONCENTRATOR:

A. One (1) Grit Concentrator shall concentrate and remove grit from the wastewater.
   1. All flow passages shall be self-cleaning and free of sharp projections or fittings that may snag stringy or fibrous material. The Concentrator shall have no protruding screws or bolts within the water flow paths of the Concentrator’s inlet duct, nozzles, or stacked tray manifolds, to prevent ‘ragging’ and debris accumulation.
   2. Flow shall transition from the inlet channel or pipe to the trays via an inlet duct positioned above the trays. Each tray shall be connected to the inlet duct by a horizontal nozzle with a rectangular cross section and large clear openings. Round nozzles, which reduce cross-sectional area and can contribute to eddy currents and non-laminar flow shall not be allowed. Designs with hydraulic turns greater than 45 degrees shall not be allowed.

3. The velocity at the influent of the Grit Concentrator at its design peak flow shall be no more than 3 ft/s.
4. The Grit Concentrator shall have a maximum surface loading rate of 11.8 gpm/square foot to ensure adequate surface area for settling and specified particle removal efficiency. This modularity allows for more precise flow management of influent flow. No exceptions shall be allowed.
5. The unit shall contain a grit sump for the collection and removal of settled solids to the grit pump. The grit sump shall be installed in the contractor supplied concrete tank.
6. The Grit Concentrator shall be all-hydraulic, with no internal moving parts, and shall consist of self-cleaning, corrosion resistant, non-metallic trays.
7. Grit Concentrator trays shall be constructed with a minimum ¼-inch thick LDPE on the pans and sidewalls. Grit Concentrator trays shall be a seamless, smooth surface, molded thermoplastic. Trays shall be single-piece construction. Multi-piece fabricated plastic, ie…plastic welded, or stainless steel trays shall not be allowed.
8. A stainless steel grit collector shall be provided with the Grit Concentrator for collection and removal of settled solids.
9. Equipment using paddles or air to supplement or induce a vortex is not acceptable.

2.05 GRIT PUMPS:

A. Materials and Construction:

1. Casing:
   a. The parts exposed to abrasive wear – case, removable suction piece, impeller, and wearplate shall be of Hi-Chrome Iron ASTM A532, Class III, Type A material, and be a minimum of 650 Brinell hardness for maximum wear resistance.
   b. Test bars shall be cast integrally with the case and suction piece and shall remain attached to the casting upon final delivery to the owner. Test bars shall be of sufficient thickness to represent the average thickness of the cast part. After receipt of final delivery, the owner may at any time prior to the final acceptance, remove the test bar and independently verify compliance to the material and hardness specification. Failure of the tested bars to meet the specified requirements shall be cause for rejection.
2. Impeller:
   a. The pump(s) shall be of a fully recessed, slurry type design, with the impeller mounted completely out of the flow path between the pump inlet and discharge connection, so that solids are not required to flow through the impeller. All flow path clearances within the pump shall be equal to or greater than the discharge diameter, so that all solids which will pass through the discharge will pass through the pump.
   b. The impeller shall be constructed of 650 Brine Hi-Chrome Iron ASTM A532, Class III, Type A and specifically designed to maintain hydraulic pumping performance as wear occurs.
   c. The impeller shall be of cup design such that the deepest portion of the vane is not located at the vane tips and the tips are surrounded by a thick-sectioned rim.
   d. The hydraulic design shall be such that the length of the impeller vane increases as wear occurs to the rim, allowing as-new or better pumping performance throughout the wear cycle of the impeller.
   e. The hydraulic design of the impeller shall preferentially direct flow to a sacrificial, independently replaceable suction piece. The suction piece shall be easily

accessible and replaceable, without the need to disassemble any other component of the pump.

3. Bearing Housing:
   a. The bearing housing shall be of cast iron, ASTM A48CL-25A.
   b. The shaft shall be of AISI Grade 1045 (or equal) steel, and shall be protected throughout the packing area by a removable, hardened 416 or 420 stainless steel shaft sleeve.
   c. Bearings shall be oil bath lubricated. The oil reservoir shall be sealed at both ends to prevent entrance of foreign matter. The thrust bearings shall consist of three angular contact ball bearings for maximum protection from all thrust loads. The bearing housing will be equipped with a pressure venting device and oil fill and drain taps. A built-in sight glass shall be furnished to check proper oil level. The bearings shall be rated for a minimum B10 life of 100,000 hours, without credit for any rear pump-out vanes to balance hydraulic thrust.
4. Shaft Sealing:
   a. Mechanical Seal: A single cartridge mechanical seal requiring no external flushing shall be furnished in the pump.
   b. Manufacturer shall provide all components necessary for seal water for the grit pump to be field installed on the potable water line by Contractor.
   c. The seal shall utilize a rotational sealing ring with an o-ring or elastomeric cup mounted rotational ring, a stainless steel rotating body with an o-ring mounted stationary ring loaded by a non-fouling, conical spring encapsulated in Viton. Installation of the seal shall require no measurements or scribe marks on the shaft.
   d. The rotational sealing ring shall be made of tungsten carbide with a 6% cobalt binder, the surface of which shall be lapped to a flatness not to exceed three helium light bands.
   e. The stationary sealing ring shall be constructed of sintered silicon carbide. The surface shall be lapped to a flatness not to exceed three helium light bands. The stationary ring shall be o-ring mounted into the stainless steel stationary body.
   f. The spring that loads the rotational sealing ring shall be cone-type, non-fouling design and shall run in the pumped product without fouling or hang-up. The spring metal material shall be SAE1075 Carbon Steel, ASTM A-684 heat-treated to a Rockwell C hardness of 42 to 46 and be totally encapsulated in Viton for protection from the pumped fluid. The product side of the spring shall have a minimum 1/4" thick Viton rubber covering for corrosion/abrasion protection.
   g. To minimize the number of points where the slurry must be sealed, the mechanical seal assembly shall have no more than four (4) o-rings: two (2) seal face o-rings, one (1) shaft sleeve o-ring, and one (1) retainer o-ring. O-rings are to be made of Viton.
   h. The seal shall be fitted with an integral shaft sleeve. The shaft sleeve shall be made of CD4MCu ASTM A-743 duplex stainless steel or type 316 stainless steel. The rotating body of the seal shall be positively driven by no less than two (2) stainless steel drive keys.
   i. All metal components not encapsulated in Viton shall be constructed of abrasion-resistant CD4MCu ASTM A-743 duplex stainless steel or type 316 stainless steel. Surface finish shall be a maximum of 64 RMS.
   j. The seal shall be capable of running with up to ± 0.025" radial shaft deflection and ± 0.040" axial shaft deflection without damage or loss of performance.

k. A seal chamber of Hi-chrome iron, ASTM A-532, minimum 600 Brinell hardness, shall be provided to mount the seal and to provide a reservoir of adequate volume for the pumped product to contact and to lubricate the seal faces. The seal shall be installed into the seal chamber from the impeller side of the pump so that only the casing/suction piece and impeller need to be removed to gain complete access to the seal for inspection and/or maintenance.

5. Accessories:
   a. Mounting:
      (1) The pump manufacturer shall provide a common pump and motor base, constructed of minimum 3/8 inch thick fabricated steel, suitably reinforced to support the full weight of the pump, motor, belt drive and guards.
      (2) The pump manufacturer shall furnish and install a separate, vertically adjustable motor base. The motor base shall be provided with four (4) threaded screws for adjustment so that the motor can be easily moved for V-belt tensioning and adjustment. Each threaded screw shall be provided with four (4) nuts: two (2) for adjusting the height and two (2) for locking the motor into position.
      (3) The motor base shall be mounted directly above the pump bearing frame so as to minimize the footprint of the pump and motor assembly.
      (4) The pump manufacturer shall supply and install belts and sheaves to drive the pump at the speed necessary to meet the rated conditions.
      (5) The drive shall be of the stationary control variable speed TB Woods type JVS, type SVS, or equal, which allows a speed change by means of an adjustment to the motor sheave when the drive is not in operation.
      (6) An approved fabricated steel belt guard shall be provided to safely enclose the belt drive. If metal guards are furnished, they shall be of all 316 stainless steel construction.
   b. Pump Discharge Connection:
      (1) Cast or ductile iron.
      (2) Flanges shall conform to ANSI B16.1.

2.06 GRIT CLASSIFIER:

A. One (1) Grit Classifier unit shall wash and classify lighter organic material from heavier grit particles.
   1. The Grit Classifying unit shall receive the underflow from the Grit Concentrator. The unit shall be mounted above the Grit Dewatering unit and discharge the concentrated grit slurry into the Grit Dewatering unit. The de-gritted overflow shall be discharged upstream of the Grit Concentrator.
   2. The unit shall require only gravity flow from the Classifier grit underflow to the Grit Dewatering unit.
   3. Grit screw classifiers, grasshoppers, reciprocating rakes and similar type of units shall not be accepted.
   4. No mechanical or electrical components shall be required. Separation shall be achieved using only gravitational and centrifugal forces derived from the pumped grit or additional supply water.
   5. The unit shall be constructed of minimum 3/16-inch thick, 304 stainless steel with flanged inlet,outlet, and overflow connections.
   6. The unit shall contain a minimum 18” diameter access portal sufficiently sized to remove all internal elements.

7. The Grit Classifier unit shall be free standing on minimum three legs and mounted above the Grit Dewatering unit. Clearance shall be provided between the bottom of the grit underflow pipe and the Grit Dewatering unit clarifier surface.

2.07 GRIT DEWATERING UNIT

A. One (1) Grit Dewatering unit shall utilize the combination of a settling compartment and an inclined conveying mechanism to dewater and transport all grit discharged from the Grit Classifier unit to a disposal container.
   1. The Grit Dewatering unit shall be provided with an integral square clarifier which shall provide at least 3 inches of freeboard.
   2. The housing shall be fitted under the clarifier. The housing for the belt shall be stainless steel with urethane bonded to the internal surfaces inclined at 30 degrees.
   3. The belt housing shall be provided with clean out plates and one (1) flanged drain.
   4. The unit shall be supplied with a belt made of two-ply polyester-reinforced continuous conductor belting. The belt cleats shall be molded 90 Durometer neoprene and shall be vulcanized on the belt. The cleats shall attach to the belt with neoprene hinges.
   5. The unit shall be provided with a lagged headroll. The headroll shall be adjustable to allow take-up of slack in the belt. Adjustment of the headroll shall not affect the headroll retainer plate, scraper, or drive unit.
   6. The unit shall be provided with a headroll scraper having high density polyethylene (HDPE) contact surfaces with a HDPE retainer plate. Both retainer plate and scraper shall be loaded to keep belt cleats closed tightly around the headroll during operation.
   7. A tailroll shall be provided designed to mount internally to the unit belt housing with external sealed bearings.
   8. The unit shall be supported on a structure and anchored to a stable base.
   9. The unit shall be supplied with a factory installed rinse bar system. The system shall include:
      a. Two spray bars located above the belt and below the clarifier liquid level to enhance grit washing.
         (1) One spray bar located at the bottom of the clarifier as a tailroll area rinse.
         (2) All structural support members for the dewatering unit and separation unit shall be provided by Manufacturer.
   10. The unit shall be supplied with all equipment and accessories necessary to regulate and automate the system water supply.
   11. The unit shall be provided with a drive unit consisting of the motor and the helical gear reducer, mounted as a single integrated unit. All Bearings shall be anti-friction, ball, or roller type bearings.
      a. The motor shall be 3 phase, 460 VAC, 60 Hz, NEMA Design B, XPFC enclosure.
      b. The helical gear reducer shall have hardened alloy steel gears accurately cut to shape.
      c. A mechanical torque-limiting clutch shall be mounted on the headroll gear assembly to prevent an accidental overload of the drive unit and belt.
      d. The drive speed shall be adjusted by a variable speed drive housed in the control enclosure. The belt speed shall be adjustable from 1-5 ft/min.

2.08 MOTORS:

A. Shall be in accordance with Section 46 05 13 and herein.
B. All motors shall be of single-speed, premium-efficient, XPFC, squirrel cage induction design.

C. All motors shall be rated for 480V, 3-phase, 60-Hz operation with the service factor of 1.0. RPM rating shall be as required.
D. Designed for operation with variable frequency drive.
E. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
F. Provide factory installed, maintenance free, circumferential, conductive micro fiber shaft grounding ring to discharge shaft currents to ground.
G. Rated horsepower as required at 40° C ambient with Class F insulation.
H. Comply with the applicable provision of NEMA with a minimum B-10 bearing life of 100,000 hours.
I. The motor shall be UL listed for Class 1, Division 2, Groups D locations.

2.09 ELECTRICAL DEVICES:

A. Electrical devices associated with the Grit Pump, and the Grit Washer/Classifier and Dewatering units will be located in a Class 1, Division 2, Groups D area. Solenoid valves, proximity sensors, etc. shall be rated for Class 1, Division 2, Group D locations or shall be wired to meet the requirements for hazardous locations as defined in the applicable articles of the National Electrical Code.
B. Electrical devices shall be corrosion resistant and shall be housed in NEMA 4X enclosures for protection against corrosion. All selector switches, pushbuttons, and indicators shall be hermetically sealed for installation in a Class I, Division 2, Group D area.

2.10 CONTROLS AND INSTRUMENTATION

A. Control Panel
1. One (1) control panel shall be furnished in accordance with Section 40 67 00
a. Panel mounted combination main disconnect switch and circuit breaker shall be accessible without opening the door.
2. The control panel shall adhere to the following specifications:
(1) Enclosure Rating: NEMA 12
(2) Voltage: 480 Volt
(3) Phase: 3 Phase
(4) Frequency: 60 Hz
(5) SCCR: 65 kA
(6) Load: NTE 30A
(7) Logic: PLC
3. The Control panel shall contain all timers, starters, VFDs, switches, indicator lights, and other components necessary to operate the following equipment:
(1) One (1) Grit Pump
(2) One (1) Grit Pump Discharge MOV.
(3) One (1) Grit dewatering Unit
4. Control panel shall be PLC based.
a. PLC shall be Allen-Bradley CompactLogix. Refer to Section 40 67 00 for requirements.
5. Control panel shall contain an OIT for local control, located on the exterior of the control panel.
a. Provide Allen-Bradley PanelView Plus 7 series as specified in Section 40 67 00. All manufacturer supplied graphics and applications shall be developed with FactoryTalk View Machine Edition.

b. The screens developed shall conform to ISA 101 "high performance" standards. High use of color and animation graphics will not be accepted.
c. Manufacturer shall provide the necessary coordination with the Systems Integrator to ensure a fully functional application.
d. The OIT shall not be the sole source of equipment control and shall be supplemented with the door mounted operators as required to operate the grit removal system in the event the OIT fails.

6. The control panel shall be supplied from a single 480V, 3-phase power source.
7. The control panel shall be supplied with a 480-120V control power transformer to provide power to 120V devices in the panel.
8. The control panel shall include provisions for connection of one (1) 120Vac, 20-Amp field supplied circuit and the internal derived 120Vac circuit from the specified 480V-120V CPT. The CPT derived circuit shall be used as "House" power for lights, fans, receptacles, etc. The field connected circuit shall be derived from the centralized UPS system and shall power all PLC, network, OIT, and control system related loads within the control panel.
9. The control panel shall be supplied with applicable control relays and time delay relays with a minimum one extra normally closed and one extra normally opened contact is provided for each relay.
10. The Automatic Grit Discharge Valve (GRSC-VLV-314) shall be supplied and powered by Others. The grit handling control panel shall provide open/close control to the valve with the following signals:
    a. Discrete outputs:
        (1) Open.
        (2) Close.
    b. Discrete inputs:
        (1) Open indication
        (2) Closed indication.
        (3) Fail indication.
11. The following signals shall be provided to the grit handling control panel from the Plant Control System. The signals shall be communicated via the Ethernet/IP network. Refer to Section 40 61 96 – I/O List for all other signal requirements.
    a. Grit Slurry Flow Meter, GRSC-FIT-311.
        (1) Analog signal measured at the grit pump/bypass discharge.
    b. System Inhibit.
        (1) Discrete signal which prevents all associated system equipment from running.
12. The grit handling control panel shall communicate with the plant PLC via an EtherNet/IP network, all controller I/O shall be accessible via the Ethernet network, including but not limited to:
    a. Grit Handling System running status.
    b. Grit Handling System alarm.
    c. Grit Pump "Auto" Mode status.
    d. Grit Pump "Hand" Mode status.
    e. Grit Pump running status.
    f. Grit Pump fail status.
    g. Grit Pump high temperature alarm.
    h. Grit Pump high discharge pressure
    i. Grit Dewatering "Auto" Mode status.
    j. Grit Dewatering "Hand" Mode status.
    k. Grit Dewatering run status.

l. Grit Dewatering fail status.
m. Grit Dewatering E-Stop alarm.
n. Grit Dewatering zero speed alarm.
o. Grit Dewatering valve status (typical all valves).

13. The OIT graphics shall include the following functionality and indication:
    a. System Alarm Reset.
    b. Grit Pump:
        (1) Running indication.
        (2) HOA.
        (3) Fail indication.
        (4) Manual start/stop.
    c. Grit Discharge Valve:
        (1) Open indication
        (2) Closed indication.
        (3) Fail indication.
    d. Grit Slurry Flow Meter:
        (1) Flow output indication.
        (2) Fail indication.
        (3) High Flow Alarm.
        (4) Low Flow Alarm.
    e. Grit Dewatering Unit:
        (1) Running indication.
        (2) HOA.
        (3) Alarm/fail indication.
        (4) Manual start/stop.
        (5) Manual speed adjustment.
        (6) Rinse water valve HOA.
        (7) Rinse water valve position indication.
        (8) Alarm reset.
        (9) Local/remote selection for escalator speed control.
14. The following devices shall also be provided in the control panel door.
    a. Push-to-test Control Power On indicating light.
    b. System Emergency Stop push button .
    c. Hand/Off/Auto switches for each piece of equipment.
    d. Power On indicating light for each piece of equipment.
    e. Fault or Failure indicating lights for each piece of equipment.
15. The panel manufacturer shall provide a data/memory map to the project's systems integrator which includes all produced tags and coordinated IP addresses as required in order to enable communication between the control panel and the communication network.
    a. The manufacturer shall be responsible for programming and verifying the IP Addresses, Subnet, and Default Gateways, when applicable, for all devices on the network.
    b. The network IP addresses shall be defined based on the Ethernet Network TCP/IP Addresses provided later.

B. Emergency Pull-Cord Stop Switch:
1. The grit washer/classifier unit shall be equipped with an emergency stop safety switch; with two normally closed double break contacts.
2. Contacts shall be manually reset.

3. Switches shall be equipped with a latching mechanism, a weight and cable along the length of the equipment for operation of the switch.
4. Switches shall be opened by cable linkage mounted on all sides of the equipment. Cables shall be plastic covered stainless-steel cable (orange color) and located within easy reach of operating personnel.
5. Shall be suitable for installation in a Class I, Division 2, Group D area.

C. Sequence of Operation
1. The system shall be controlled to provide automatic or manual operation, manual starting and stopping and system shut down when a fault is detected.
   a. When HOA switches are placed in "Hand", the associated equipment will start and run.
   b. When HOA switches are placed in "Auto", the associated equipment operate according to the specified timers and setpoints.
2. Screened raw wastewater will flow by gravity from the Perforated Plate Screens into the Grit Concentrator.
3. Plant Reuse / Process Water shall be supplied and distributed between the Grit Concentrator fluidizing line, the Grit Washing/Classifier Unit and the Grit Dewatering Unit.
4. Grit Classifier Unit
   a. Grit slurry shall be continuously transferred from the Grit Concentrator to the Grit Classification unit. Grit slurry shall normally be transferred using the Grit Pump.
   b. The control system shall be capable of running in a Grit Pump Bypass mode wherein plant staff must isolate the pump and open a bypass pinch valve around the pump. Automatic Grit Discharge Valve GRSC-VLV-314 (provided by Others), shall be controlled by the Grit Removal System manufacturer as needed to achieve acceptable performance. The automatic grit discharge valve shall be provided with an electric motor actuator and shall be operated as an OPEN/CLOSE valve.
   c. An accumulating timer (AT) shall reset and begin timing out when a signal is received indicating flow of plant influent to the Grit Classification unit. The AT regulates the length of time between Grit Blowdown Cycles. When the AT times out, it shall send a signal to initiate a Grit Blowdown Cycle. The AT shall be adjustable between 5 min to 480 minutes, initially set at 180 minutes. The panel shall be equipped with two timers, one for dry weather, and one for wet weather. For higher grit loads, the wet weather timer shall increase the frequency of the Grit Blowdown Cycle as compared with the dry weather timer. The timer being used shall be selected by a local switch or by remote contact closure on terminals provided in the panel.
   d. During the Grit Blowdown Cycle, the grit pump will stop and the contents of the Grit Classification unit will empty into the Grit Dewatering Escalator. In Grit Pump Bypass mode, GRSC-VLV-314 shall close during the blowdown cycle, and reopen once the cycle is completed.
5. Grit Dewatering Unit
   (1) The grit dewatering belt shall run whenever grit slurry is being transported to the unit.
   (2) While the Dewatering Unit is running, water shall be directed to the tailroll self cleaning mechanism and grit rinse system.
   (3) The belt speed shall be adjustable via a manual input at the OIT.
   (4) A motion sensor shall be installed on the side of the Grit Dewatering Unit takeup frame and shall detect movement of the headroll scraper arm. Lack of

motion of the headroll scraper arm shall indicate lack of belt movement, drive unit failure and/or scraper arm overload. Lack of belt movement or scraper arm overload shall interrupt signal from the motion sensor to the timer. If the motion sensor fails to reset the timer, the Grit Dewatering Unit shall stop and the failure light illuminate.

(5) After a system shut down the Grit Dewatering Unit shall continue to operate for a pre-determined amount of time to allow for the removal and dewatering of all grit accumulated in the clarifier.

D. Setpoints and Ranges:
   1. Grit Slurry Flow Meter GRSC-FIT-311.
      a. Refer to 40 70 00 Instrument List for calibration range.
      b. High Flow Alarm adjustable between 0-400 gpm, initially set at 250 gpm.
      c. Low Flow Alarm adjustable between 0-400 gpm, initially set at 150 gpm.

2.11 PROTECTIVE COATINGS:

A. All non-stainless-steel surfaces shall be factory painted with protective coating according to Manufacturer's recommendation.
B. Color shall be standard of the Manufacturer’s.
C. Stainless steel or aluminum components shall not be painted.
D. Moving parts of operating units, mechanical and electrical parts, linkages, sensing devices, motor and fan shafts, etc., shall not require finish painting.
E. Miscellaneous accessories such as gear boxes, motors and controls may be finished with Manufacturer's standard paint finish.
F. Provide field touch-up coating system which includes the Manufacturer’s standard prime coating system.
G. Coatings are subject to the review and approval of the Engineer.

2.12 SPARE PARTS:

A. All spare parts shall be properly packaged for storage and labeled. Store as recommended by the equipment Manufacturer.
B. Spare parts shall include, but not be limited to, the following:
   1. Lubricants sufficient for one year’s operation at Manufacturer’s recommended service intervals.
   2. One (1) of each part designed for wear.
   3. Pump spare parts:
      a. One mechanical seal
      b. One set of bearings
      c. One set of V-belts
      d. One wear plate
      e. One set of gaskets and o-rings
   4. Manufacturer’s recommended spare parts.
C. Special Tools and Accessories:
   1. Manufacturer shall supply one set of all special tools as required to assemble and disassemble the screening equipment.

2.13 ANCHOR BOLT ASSEMBLY:

A. Complete anchor bolt assembly (studs, nuts, washers, etc.) to be designed by the Manufacturer and provided by the Contractor. Anchor material shall be 316 SST. Anchor size and embedment shall be clearly shown on the equipment drawings.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. The Contractor shall install equipment in conformance with the Manufacturer's written instructions.
B. The Contractor shall accurately place anchor bolts using templates furnished by the Manufacturer.
C. The Contractor shall coordinate and arrange with Manufacturer an appropriate time to verify and accept proper installation. Manufacturer shall provide certificate of proper installation to Contractor, Owner, and Engineer prior to mechanical testing.

3.02 FIELD QUALITY CONTROL:

A. Installation Check:
   1. The Manufacturer shall provide the services of a factory field engineer to initially check installation of the equipment, make electrical control panel modifications as necessary, and to place the equipment in service in accordance with the quality control section.
   2. The field engineer shall also be responsible for instructing operating personnel as to proper operational process and maintenance procedures.

B. Mechanical Startup Tests:
   1. After equipment is completely installed and the qualified representative of the Manufacturer has checked the installation and found it to be in accordance with the Manufacturer's recommendations, a field mechanical startup test shall be performed by the Contractor with the assistance of the Manufacturer's field representative. The Owner and Engineer will observe all tests. The date for the start of testing shall be set in mutual agreement with the Owner.
   2. All equipment shall be calibrated in the presence of the Engineer before and after the tests. Contractor and equipment Manufacturer shall provide any information requested by the Engineer.
   3. All labor, materials, and test apparatus necessary for conducting the field acceptance test shall be furnished by Manufacturer at no additional cost.

3.03 MANUFACTURER'S SERVICES:

A. The equipment shall be started by a Manufacturer's representative, who shall certify to the Engineer that all equipment is properly installed and the plant operator has been instructed concerning proper operation and maintenance. Operator training shall include all items contained in the operation and maintenance manual.
B. Manufacturer's Authorized Representative: Present at work site or classroom designated by the Owner, for the minimum person-days listed below, travel time excluded.
   a. One (1) person-days for installation assistance, inspection, and certification of installation.
   b. One (1) person-days for testing.
   c. One (1) person-days for pre-startup classroom or job site training. Training shall include, at a minimum, proper operation, proper maintenance, troubleshooting, handling/disposal of lamps, safety, and calibration of instrumentation. The session shall also be attended by the local equipment Manufacturer's representative.

END OF SECTION 46 23 00

SECTION 46 33 33 – POLYMER PREPARATION AND FEED SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

A. This Section includes the fabrication, delivery, installation and placement into successful operation of two (2) complete polymer systems including a liquid emulsion polymer handling system, flexible suction piping, polymer activation system, metering pump, tote/drum mixer, post dilution assembly and all accessories and appurtenances as indicated and required for complete operation.

B. The automatic polymer preparation, metering, and post dilution system shall be an integrated equipment package capable of automatically preparing a high molecular weight flocculent-type polymer into a homogenous polymer solution. The system shall be an automatically controlled unit capable of preparing a polymer solution from liquid emulsion polymer. The system shall continuously supply polymer solution and be designed to automatically meter, dilute, and feed polymer solution upstream of the rotary drum thickener.

C. The system shall be capable of preparing a homogeneous polymer solution within the time limitations resulting from the maximum feed rates specified.

D. Homogenous polymer solution shall be defined as having no visible "fish-eyes" and exhibiting a viscosity at the end of the mixing cycle within ±10% of the polymer manufacturer's published value for an activated solution at the prepared solution strength (e.g., 0.5% solution by weight).

E. Electrical and Controls:

1. Primary control for the polymer preparation and metering system shall be through the Rotary Drum Thickener (RDT) Control System. The RDT Control System will have the ability to control all elements of the thickening process including: the feed pumps, flocculation tank, RDT, thickened sludge pumps, polymer feed system, and wash water system. The RDT Control System will interface with the polymer system local control panel for feed start/stop, system fail, metering pump feed rate, and polymer pacing rate. See Rotary Drum Thickener 46 71 33.
2. A local control panel shall be provided for each polymer preparation metering system meeting the minimum control requirements of this Section.

F. Polymer will be provided by the Owner.

1.02 QUALITY ASSURANCE:

A. Polymer preparation system, pumps, control panels, post dilution assembly, and accessories shall be furnished from a single source. This source being responsible for coordinating system components to provide a complete functioning system. The polymer unit shall be pre-wired and pre-piped with minimal field assembly required.

B. Prior to shipment the system shall be inspected for quality of construction verifying all fasteners and fittings are tight, all wires are secure and connections whisker-free.

C. The complete system shall be fully factory tested prior to shipment. Testing shall include: setting and verification of all instrumentation and sensors per the design requirements of the application; pressure testing all plumbing systems for a minimum of one hour at 125 psi. If leaks are found they shall be fixed and a new test shall be conducted for one hour at 125 psi until the plumbing system is verified to be leak free; verification of system design flow rates, and complete functional simulation of operation.

D. Polymer preparation systems utilizing eductors, conventional wetting bowls, or systems that merely meter polymer into a water vortex for initial wetting of polymer shall not be allowed under any circumstances.

12. Underwriters Laboratories, Inc. (UL).

B. Related Work Specified Elsewhere:
1. Rotary Drum Thickener – Section 46 71 33.
2. Process Control Panels and Hardware – Section 40 67 00
3. Instrumentation for Process Systems – Section 40 70 00
4. Common Motor Requirements for Water and Wastewater Equipment – Section 46 05 13.

1.04 SUBMITTALS:

A. Submit in accordance with Division 01.

B. Provide motor nameplate information consisting of manufacturer's name and serial number, horsepower output, temperature rise, maximum ambient temperature, altitude rating (and derating, if applicable), insulation class, rpm at rated load, frequency, number of phases, voltage, full load current, locked rotor current, service factor, maximum noise level (dBA), efficiency determined by IEEE 112, Method B, and weight information.

C. Equipment and Accessories:
1. Manufacturer's name, type, and model.
2. Detailed calculations showing compliance with specified conditions and requirements.
3. Protective coating systems.
4. General arrangements, dimensions and mounting details.
5. All details for accessories including materials of construction, pressure ratings, and specific information that addresses specified criteria.
6. Pump characteristic curves (head vs. flow) and all mechanical details.
7. Control panel schematic diagrams, bill of materials, details, and elevations. Identify field and factory wiring.
8. General arrangement drawings of all equipment.
9. Anchor bolt requirements
10. Weights of all components.
11. Operation and Maintenance Manuals including, but not limited to:
    a. System operation.
    b. Schedule of maintenance requirements, routine maintenance procedures, complete with specifications for consumable items.
    c. Calibration procedures.
    d. Trouble shooting.
    e. Listing of common spare parts along with prices and ordering information.
    f. Appendices containing O&M manuals of ancillary equipment.
    g. Project bill of materials including mechanical and electrical components utilized.

1.05 WARRANTY:

A. The manufacturer shall warrant that all Equipment shall be free of defects caused by faulty material or workmanship and shall replace those parts for at least a period of one (1) year from the date of start-up.

B. Multiple warranties for individual components shall not be acceptable.

1.06 DELIVERY, STORAGE, AND HANDLING:

A. Delivery, storage, and handling shall conform to the following requirements:

1. Ship equipment as completely assembled as is possible.
2. Tag each item of equipment with contract number and equipment number.
3. Protect connections with suitable pipe end protection.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

1. Velodyne.
2. UGSI.
3. Wallace & Tiernan.
4. Fluid Dynamics.

2.02 GENERAL

A. The polymer feed systems shall prepare, dilute, and feed a uniform homogenous solution of polymer from emulsion dispersion or solution type neat polymer.

B. The systems shall include, but not be limited to neat polymer metering pump, mechanical activation chamber, flow indicator, pressure regulator, integral controls and all necessary valves and piping necessary to make a complete package unit.

C. The unit shall be skid-mounted and factory pre-piped and wired and ready for connection to power and water supply indicated.

D. Polymer will be provided by the Owner.

E. In addition to the requirements listed in this section, all electrical equipment and components shall conform to requirements in DIVISION 26 and DIVISION 40.

2.03 SYSTEM PERFORMANCE REQUIREMENTS:

A. General: The system will be used to condition waste activated sludge from aerobic granule process prior to thickening and shall be capable of preparing homogeneous polymer solution according to the design criteria outlined below:

1. Polymer type: liquid emulsion
2. Dilution Water Range:
    a. Minimum: 180 gph
    b. Maximum: 1,800 gph
3. Neat Polymer Feed Range:
    a. Minimum: 0.5 gph
    b. Maximum: 4.2 gph
4. Stock emulsion polymer active concentration: 30%-40%.
5. Water Pressure Available: 50-75 psi.
6. Water Type Available: Non-Potable.
7. Neat polymer viscosity range 200-6,000 cps.

2.04 MANUFACTURED UNITS:

A. Number of units: 2.
B. Each system shall be an integrated package pre-piped, pre-wired, skid-mounted system. This configuration shall provide for complete polymer preparation systems occupying the available floor space.

2.05 POLYMER STORAGE EQUIPMENT

A. Emulsion polymer will be stored in and fed from two 330-gallon totes.
B. Manufacturer shall include flexible PVC spiralite piping (or equal) suitable for pump suction. Flexible piping shall include two isolation ball valves, cam-lock or similar connection and threaded connection compatible with a standard 330-gallon tote. Adequate length shall be provided for connecting polymer preparation system to tote location as indicated drawings.
C. Manufacturer shall provide a vertical mechanical mixer suitable for mounting on each drum and tote to keep the emulsion polymer in suspension.

2.06 POLYMER PREPARATION EQUIPMENT:

A. Polymer Preparation System:
    1. Polymer Activation Device:
        a. Provide one polymer activation device for each polymer feed skid.
            (1) Liquid polymer shall be pumped to the Manufacturer's standard mechanical and liquid polymer activation chamber.
                (a) Include all necessary accessories.
                (b) Provide a neat polymer check valve specifically designed to isolate neat polymer from dilution water. Check valves which are installed inside the mixing chamber, or which require mixing chamber disassembly for servicing will not be accepted.
                (c) The mechanical polymer activation devices shall be driven by a wash-down duty motor.
            (2) Provide two neat polymer metering pumps (1 duty, 1 standby).
                (a) The neat polymer metering pumps shall be a progressive cavity type.
                (b) Each neat polymer metering pump shall have a capacity to meet the requirements in ARTICLE 2.03.
    2. All polymer preparation system components shall be skid mounted, requiring single connection points for polymer feed, activation/dilution water, power, and controls.
    3. All polymer skid motors shall be adjustable speed. The speed of each motor shall be adjustable on the face of the control panel.
    4. Polymer tote mixer motor shall be rated for 120Vac, 1 phase, 60Hz operation. The motor shall be powered through a cord and plug, pre-wired to the motor. Motor-rated switch and timer shall be provided on the motor assembly to start/stop the motor.
    5. Polymer Preparation System Water Flow:
        (1) Dilution water flow shall be maintained by means of a flow control valve. A differential pressure indicator/switch shall be supplied to display water differential pressure. Low differential pressure switch shall shut down system and energize panel mounted alarm light and audible alarm after delay.
    6. Dilution Assembly:
        (1) The dilution water flow rate shall be monitored by a rotameter having the appropriate range for the minimum to maximum dilution water flow for the polymer system as specified in ARTICLE 2.03. Unions or flanges shall be provided on the rotameter to allow easy removal for cleaning.

(2) The unit shall have an electric solenoid valve for on/off control of total dilution water flow.
(3) A differential pressure type low water differential pressure alarm shall be provided. The switch shall be adjustable between 25 and 100 psig.
(4) Provide a pressure gauge to monitor dilution water inlet pressure.
(5) Provide a pressure gauge to monitor system discharge pressure.

b. The dilution system shall automatically cease water flow by shutting the water supply solenoid valve when polymer feed pumps are de-energized.

2.07 POLYMER PREPARATION SYSTEM CONTROL PANEL:

A. Each Polymer System shall be supplied with a single local control panel designed to house all components required to control the polymer system.
B. Control Panel shall be provided in accordance with requirements detailed in Section 40 67 00 in addition to specific panel requirements listed below.
C. Control panels will be installed indoors in a non-classified space.
D. Control panel shall be sized to provide heat dissipation such that, at a 110°F ambient temperature, the operating temperature rating of the lowest-rated component in the panel is not exceeded.
E. A panel mounted combination main disconnect switch and circuit breaker shall be accessible without opening the door.
F. Control panel shall include thermal magnetic circuit breakers for each motor load.
G. The control panel shall adhere to the following specifications:
1. Enclosure Rating: NEMA 4X, FRP or SST Type 316
2. Voltage: 120 Volt
3. Phase: 1 Phase
4. Frequency: 60 Hz
5. SCCR: 22 kA
6. Mounting: Skid Mounted
H. All Polymer Feed System devices and equipment requiring electrical power shall be supplied by 120Vac local control panel input power. Provide power distribution and power conversion devices as necessary, in accordance with Section 40 67 00.
I. All Polymer Feed System electrical devices and equipment shall be pre-wired to the local control panel. All wiring for analog 4-20mA signals shall be shielded, twisted cabling.
J. Control panel shall be attached to the system's frame and be positioned such that there are no obstructions in front of the control panel per related NFPA 70 requirements.
K. Control panel shall include the following switches on the front panel at minimum:
1. Local-Off-Remote three position selector switch
2. Pump 1-Off-Pump 2 three position selector switch
3. System Reset pushbutton
L. Control panel shall include the following push-to-test indicator lights on the front panel:
1. Power On
2. Feed Pump #1 Run
3. Feed Pump #1 Fail
4. Feed Pump #2 Run
5. Feed Pump #2 Fail
6. Polymer Activation Device Run
7. Polymer Activation Device Fail
8. System Fail
9. Feed Pump #1 High Pressure

10. Feed Pump #2 High Pressure
11. Low Polymer Flow
12. Dilution Water Low Differential Pressure

M. Control panel shall include potentiometers on the face of the panel for local speed control of the following motors:
   1. Feed Pump #1
   2. Feed Pump #2
   3. Polymer Activation Device

N. Control panel shall include an electronic flow metering display for each feed pump on the face of the panel. Metering displays shall meet the following requirements:
   1. Calculate flow with pump motor speed as input variable.
   2. Display feed rate in GPH.

O. The control panel shall interface with the Plant Control System PLC via hard-wired I/O points. The following points shall be provided as minimum with additional points available per manufacturer recommendations:
   1. Inputs to Polymer System from PCS:
      a. Feed Pump #1 Remote Start / Stop (Discrete)
      b. Feed Pump #2 Remote Start / Stop (Discrete)
      c. Feed Pump #1 Pump Speed Signal (Analog, 4-20mA)
      d. Feed Pump #2 Pump Speed Signal (Analog, 4-20mA)
   2. Outputs from Polymer System to PCS:
      a. System Running with Feed Pump #1 (Discrete)
      b. System Running with Feed Pump #2 (Discrete)
      c. Remote Mode (Discrete)
      d. Common Alarm (Discrete)
      e. Polymer Feed Pump #1 Rate (Analog, 4-20mA)
      f. Polymer Feed Pump #2 Rate (Analog, 4-20mA)

P. Description of Operation:
   1. The polymer system shall be capable of being controlled locally at the local control panel or remotely by the Plant Control System PLC when the HAND/OFF/REMOTE switch is in REMOTE.
      a. HAND Control:
         (1) When the polymer system is in HAND control, starting, stopping, and polymer feed rate adjustment of the feeder shall be controlled at the local control panel.
         (2) The pump selector switch shall determine which feed pump will begin to run when placed in HAND. The selected pump and mixing device will start and run if the LOR switch is in HAND and a feed pump is selected.
         (3) Speed rates of the feed pumps shall be controlled by potentiometers located on the face of the panel.
      b. REMOTE Control:
         (1) When the polymer feeder is in REMOTE control, starting, stopping, and polymer feed rate adjustment of the feeder shall be controlled by the Plant Control System PLC.
         (2) When the start/stop contact associated with the polymer feeder is closed, the polymer feeder and activation device shall start. When the start/stop contact associated with the polymer feeder is opened, the polymer feeder and activation device shall stop.
      c. Sequence of Operation

(1) As per manufacturer's recommended sequence of startup and shutdown of the polymer feed system and ancillary components.

d. System Upsets and Procedures for Recovery:

(1) If a pump failure or other system failure occurs, the polymer system shall alarm the operator via the control panel indicator lights and the common alarm discrete output.

2.08 ACCESSORIES:

A. Each polymer feed system shall be provided with the following in the minimum number indicated on Drawings, specified, or required for full proper operation.

B. Pressure Relief Valves:

1. Valve shall have materials of construction compatible with the specified chemical.
2. Valve shall be field adjustable from near zero to a maximum required pressure set point.
3. Discharge from relief valves shall be piped together to one connection point. Contractor shall route piping from connection point to polymer totes.
4. Valves shall be sized for maximum flow conditions of the supplied chemical pump system.
5. Supplier shall confirm maximum flow rate based on supplied units.
6. Valves shall have SCH 80 PVC body with connections as required.

C. Check Valves:

1. To minimize check valve plugging due to normally occurring polymer agglomerations, the minimum open area up to and including the valve seat shall be 3/16" without exception.
2. The valve body shall be constructed of Teflon with Viton seals. The valve poppet and spring shall be stainless steel. The spring shall be outside of the polymer flow path to prevent build-up and plugging.
3. The valve shall be readily accessible for cleaning and shall not require tools for removal, cleaning or replacement.

D. Calibration Column Ball Valves:

1. Quantity required shall be determined by manufacturer/supplier.
2. Acceptable Manufacturers:
   a. Chemtrol, Celanese Piping Systems, Inc., TU Series.
   b. Hayward.
   c. Plasts-O-Matic.
   d. Spears.
   e. No Substitutions Allowed.
3. Suitable for required chemical solution feed.
4. Suitable for working pressure of 125 psi.
5. All PVC Type 1 Grade 1.
6. 3-inch and Smaller Valves:
   a. Seals shall be Viton O-rings.
   b. Shall be double union design which permits removal of valve from line without cutting or disassembling pipe.
   c. Shall have socket ends.
   d. Seats shall be Teflon.
   e. Body shall have full unrestricted circular inlet and outlet with diameter equal to rated size of valve.
   f. Totally enclosed operating mechanism mounted on and attached to valve body.
   g. Movable ball having unobstructed circular opening.

h. Install in lines indicated.

E. Pressure Gauges:
1. Shall be Ashcroft Model 1379 or equal.
2. Minimum gauge diameter of 4-1/2 inches.
3. Gauge material shall be suitable for the intended service environment with the appropriate pressure range and reading for each chemical feed system.
4. Provide PVC diaphragm seal.
5. Refer to Section 40 70 00 for other requirements.

F. Diaphragm Pressure Switches:
1. Diaphragm sealed pressure switch with stainless steel wetted parts.
2. NPT process connection, size as required.
3. Snap action SPDT switch rated 4 amps at 120Vac minimum.
4. Housed in a NEMA 4X enclosure, unless specified otherwise.
5. Adjustable pressure set point.
6. Refer to Section 40 70 00 for other requirements.

G. Flow switches:
1. Refer to Section 40 70 00 for requirements.

H. Piping:
1. All polymer feed and dilution water piping shall be Schedule 80 PVC meeting ASTM D1785 and ASTM D2467.

I. Calibration Column
1. Provide a calibration column with Viton O-rings and full port PVC ball valves to allow isolation of each pump and calibration column.
2. The column shall be calibrated for a one minute draw-down at maximum pump rate and read in GPH and milliliters.
3. The calibration column shall be rigidly mounted to the system's frame.

J. Refer to Section 40 70 00 for requirements of all other instruments not specified herein.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. All work shall conform to manufacturer's recommendations.
B. Chemical feed equipment shall be installed in accordance with manufacturer's instructions and as indicated.
C. Install all equipment as required for successful operation.
D. The final routing shall be determined in the field by the Contractor prior to installation and after approval by the Owner. This work shall be performed at no additional cost to Owner.
E. Piping materials shall be schedule 80 PVC.

3.02 MANUFACTURER'S FIELD SERVICES:

A. Provide a minimum of two (2) days of field services for startup and training, excluding travel time.
B. Provide a minimum on one (1) day of installation supervision, excluding travel time.

3.03 PERFORMANCE TESTS:

A. Conduct in the presence of Contractor, Engineer, and Owner.
B. Equipment Tests:
1. Check performance of all components as a functioning unit.
2. Check alignment of each unit.

C. Operational Test:
   1. Conduct such operational tests as necessary to determine that the performance of equipment and controls is as specified.
D. Make all necessary equipment adjustments and corrective work indicated by tests.
E. Retesting: If any deficiencies are revealed during any test, such deficiencies shall be corrected, and the tests shall be reconducted.
F. Within 7 days, submit a written test report to General Contractor with one copy to Owner in the form of a letter, stating operations performed and results obtained for each unit.

END OF SECTION 46 33 33

SECTION 46 42 57 – LARGE BUBBLE MIXING SYSTEM

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section details the furnishing of a complete large bubble mixing system to mix thickened waste activated sludge stored in two (2) thickened sludge holding tanks. The complete large bubble mixing system shall include two (2) compressors, a receiver tank, two (2) valve control panels, compressed gas mixing system, instrumentation, auxiliary equipment, and accessories as specified herein and as required for a complete working system.

B. The system shall control the mixing of the sludge holding tanks through instrumentation feedback with the ability for manual operation of the mixing devices.

C. The mixing system shall intermittently and sequentially inject compressed air through fixed nozzles located on the basin floor to mix the tank contents with a total solids content of 4-8 wt %.

D. Related Work Specified Elsewhere:

1. Protective Coatings: Division 9.
2. Process Control Panels and Hardware: Section 40 67 00.
3. Common Motor requirements for Water and Wastewater Equipment: Section 46 05 13.

1.02 REFERENCES:

1.03 SUBMITTALS:

A. Submit in accordance with DIVISION 1.

B. Shop drawings.

C. Operation and maintenance data.

D. Installation, inspection and start-up report.

E. The following shall be submitted with the Shop Drawings:

1. Catalog data or illustrations showing principal parts and materials.
2. Detailed layout drawings.
3. Electrical schematics.
4. Operating and maintenance instructions and parts list.
5. Compressor support locations and loads transmitted to bases and foundations.
6. Compressor electrical schematics and field termination wiring.

7. Compressor performance data.
8. List of recommended accessories to maintain operation other than those specified.
9. Field inspection reports.
10. Qualifications of field service engineer.
11. Recommendations for short and long-term storage.
12. Testing procedures.
13. Special tool requirements.
14. Printed warranty.

1.04 QUALITY ASSURANCE:

A. The compressed gas mixing system shall be furnished by a single manufacturer.

B. Manufacturer must have at least five (5) municipal wastewater installations within North America that have been installed in the last 36 months. Manufacturer shall provide a list of said installations, including the Owner's name, address, contact name, telephone number, date of start-up, and system design summary.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. EnviroMix, Inc.
B. Pulsair
C. Engineer-Approved Equal.

2.02 GENERAL REQUIREMENTS:

B. Performance and design of the compressed gas mixing system shall be as follows:
   1. Sludge Holding Tanks:
      a. Number of basins: 2.
      b. Basin Length: 37.5 ft.
      c. Basin Width: 24 ft.
      d. Minimum Side Water Depth:4 ft.
      e. Maximum Side Water Depth: 20 ft.
      f. Maximum Volume: 134,658 gal / EA tank.
      g. Minimum Solids Content: 4 wt%
      h. Typical Solids Content:4-6%
      i. Maximum Solids Content: 8 wt%
   2. Basin Mixing shall be uniform throughout the basin with effective mixing confirmed through a Field Performance Test as specified.
   3. Minimum nozzle density in each thickened sludge tank shall be 41 ft^2/nozzle.
   4. Air Distribution and balancing shall be sufficient to maintain suspended solids in a state of suspension over entire depth of basins.
   5. Air mixing system equipment and piping shall be sized to thoroughly mix the contents of the basins for which the systems are designed.
   6. Air mixing system shall be capable of effectively mixing entire tank contents for both tanks when operating at a solids concentration up to 8% total solids.
   7. Mixing Process shall use the design as follows:
      a. Sludge Holding Tanks:
         1) Number of Valve Control Panels (VCPs): 1 per tank
         2) Number of Air Control Valves per VCP: Varies
         3) Number of Nozzle Headers: Varies.
         4) Number of Nozzles per Nozzle Header: Varies.
         5) Minimum Number of Nozzles: Varies
         6) Header Supply Pipe Diameter: 1.5 in.

2.03 MATERIALS AND CONSTRUCTION:

A. Header Supply Piping:
   1. Provide threaded connections only where required.
   2. Schedule 5S or Schedule 40S, stainless steel Press technology system (Victaulic, Viega, or equal), comprised of stainless-steel press technology fittings, couplings, and pipe, unless specified otherwise.
   3. Maximum working pressure of 150 psi.
   4. Couplings and fittings: Press technology products formed of Type 304/304L stainless steel tubing including a self-contained o-ring seal(s) molded of synthetic FKM rubber.
   5. Pipe: Type 304/304L ASTM A312 stainless steel.

B. Nozzle Headers:
   1. Schedule 10S or Schedule 40S, 304/304L stainless steel with 1” Schedule 40S, stainless steel nozzle offsets
   2. Nozzle couplings: 1” NPT, 150 lb, 304/304L stainless steel
   3. Delivered from the manufacturer pre-assembled to the extent practicable to minimize field assembly error and installation time.
   4. Pipe: Type 304/304L ASTM A312 stainless steel.
   5. Provide nozzle headers in maximum 20-ft segments with two bolt 304/304L stainless steel flexible gasketed coupling connections and removable end caps. Flexible couplings shall be rated for a maximum working pressure of 150 psi.

C. Nozzles:
   1. Top plate fabricated from 1/8” stainless steel plate, ASTM A240/A240M, Type 304/304L with a 2D finish.
   2. Bottom plate fabricated from HDPE and gasketed to prevent air from leaking between the top plate and the bottom plate.
   3. Top and bottom nozzle plates shall be joined together using Type 304/304L stainless steel hardware. Nozzles shall come pre-assembled.
   4. Adequate strength to withstand vertical thrust of mixing air.
   5. Threaded Rod Anchors: Use Hilti HIT-RE 500 adhesive or equal to be provided by the contractor. A minimum of two threaded rods shall be installed per nozzle for flat floor installations, one each on opposite diagonal corners. Three threaded rods shall be installed per nozzle for slope floor installations.
   6. Nozzles shall be installed in the locations as shown on the Drawings.

D. Appurtenances:
   1. Miscellaneous: Nuts, bolts, washers, threaded rod, and other non-welded parts shall be stainless steel, ASTM A240/A240M, Type 304/306L. Threaded assemblies shall be chemically treated or lubricated prior to assembling to prevent galling.

E. Fabrication:
   1. The piping used for the air mixing system shall be Type 304/304L stainless steel unless otherwise noted.
   2. Shop fabricate welded metal parts and assemblies from stainless steel, ASTM A240/A240M, Type 304/304L with a 2D finish.
   3. Shop fabricate non-welded parts and pieces from sheets and plates of stainless steel, ASTM A240/A240M, Type 304 or from bars of stainless steel ASTM A276, Type 304, unless specified otherwise.
   4. Welds and Welding Procedure
   5. Shop weld with filler wire using MIG, TIG or shield-arc, or plasma-arc welding inert gas processes. Provide a cross-section equal to or greater than parent metal.
   6. Provide full penetration welds to interior surface with gas shielding to interior and exterior of joint
   7. Provide smooth, evenly distributed interior weld beads with an interior projection not exceeding 1/16 inch beyond inner diameter of nozzle header or fittings

8. Field welding is not permitted
9. Clean all welded stainless steel surfaces and welds after fabrication to remove weld splatter and finish clean all exterior welds, carbon deposits and contaminants per ASTM A380 Section 6.2.11.

2.04 VALVE CONTROL PANELS

A. Each tank shall be equipped with a Valve Control Panel (VCP).
B. Valve Control Panels (VCP) shall be provided in accordance with requirements detailed in Section 40 67 00 in addition to specific panel requirements listed below.
C. Valve Control Panels will be installed outdoors at grade on the south wall of sludge holding tank No. 2 and north wall of sludge holding tank No. 1. Refer to drawings for locations of VCPs.
D. Valve Control Panels shall be sized to provide heat dissipation such that, at a 110°F ambient temperature, the operating temperature rating of the lowest-rated component in the panel is not exceeded.
E. The valve control panel shall be provided with a hinged lockable cover.
F. All panels shall accept a single source 120 VAC power connection.
G. Control panel shall have short circuit current rating (SCCR) of 22 kA.
H. Lightning and surge protection shall be provided on the incoming line power.
I. The air control valves shall be poppet style valves, mounted to a common manifold. The valves shall have a life expectancy of 20,000,000 cycles.
J. Each valve control panel shall be equipped with a manually adjustable regulator to adjust the pressure to the air control valves and corresponding header supply piping. The regulator shall be pre-plumbed into the valve control panel and be equipped with a pressure gauge. The regulator shall have an aluminum body and bonnet, plated steel screws, brass internals, and Buna N seals.
K. Each valve control panel shall include a pre-plumbed maximum 40-micron filter with an auto-drain to remove fine particles, water vapor, and oil from the air supply. The filter shall be Watts F603D or approved equal.
L. The VCP shall be supplied with a means to alarm operators should a valve fail to open or close.
    1. A flow switch or pressure switch in the valve control panel to initiate a valve failure alarm should a switch fail to operate when a valve is commanded open or closed.
    2. When either a fail to open or fail to close alarm occurs the controller shall send an alarm signal to the Plant Control System. The output shall be provided through dry, form C contacts, rated 5A at 120Vac.
    3. The VCP shall include a top mounted exterior alarm beacon that shall provide an indication of an active alarm.
M. A stainless steel nameplate shall be provided on the valve control panel. The nameplate shall be securely fastened in a conspicuous place and clearly inscribed with the manufacturer's name, year of manufacture, and serial number.

2.05 CONTROL AND OPERATION:

A. All control features shall be adjustable from the VCP provided by the manufacturer.
B. Control features shall be adjustable at any time during the operation of the system.
C. Control features shall be initially set according to manufacturer recommendations.
D. Mixing Parameters:
    1. The operator shall be able to enable/disable mixing operation, the firing duration and the frequency of firing.
    2. Minimum control features selected through the VCP shall include the following:
        a. Enable / Disable: ACV firing can be started and stopped at any point during operation without powering down the system.
        b. Firing Duration: Length of time an individual ACV is open during a firing event. The duration shall be operator adjustable within programmed limits and configurable for each ACV individually.

c. Firing Frequency: Length of time to complete the firing sequence. Frequency shall be operator adjustable within programmed limits.
d. Valve Isolation: Individual ACVs or specific groups of ACVs may be added and/or removed from the firing sequence at any point during operation.

E. Alarm Indication:
1. When the following alarms occur, a red general alarm light shall be illuminated on the VCP:
a. Low system pressure.
2. The specific alarm shall be indicated and shall remain indicated until the fault is corrected or the system is turned off.

2.06 AIR COMPRESSORS:

A. High Pressure Air Compressors:
1. Two (2) air compressor module shall be as noted in the design requirements below.
2. Each compressor module shall be completely factory assembled requiring only field connection of electrical power and air pipe and condensate drain piping.
3. Each compressor shall be of the single stage, positive displacement, oil-flooded, rotary screw type.
4. The two compressors shall be designed to operate in a duty standby configuration and will be located indoors.
5. The compressor shall be provided with an integral skid or lifting lugs for unloading and placement.
6. Compressor rotor shall be asymmetrical, steel or high strength ductile iron integral shafts, and dynamically balanced. Housings shall be cast iron. Rotors and housings shall be precision machined for accurate bearing positioning and running clearances. The drive arrangement shall be a gear driven design.
7. Positive pressure lubrication shall be provided by an inherent pressure differential system. Lubricant shall be provided as recommended by the manufacturer. A lubricant filter shall have a high-capacity 10 micron rating.
8. An air/oil separator reservoir shall be provided for each compressor. The reservoir shall be designed and constructed in accordance with the ASME Code for Unfired Pressure Vessels and shall bear the code stamp. The reservoir shall include two-stage filtration to remove oil from air stream. Oil carry-over downstream of compressor modules shall not exceed 3 mg/m^3.
9. Each air compressor module shall have automatic controls integral to the unit which open (loaded condition) and close (unloaded condition) the inlet valve to the air end to deliver appropriate volume to meet demand and maintain system target pressure. On sensing a low demand, the motor will keep running but the air end inlet valve will close, resulting in a decreased “idling” power draw on the motor. The valve shall reopen when system pressure drops below the set point.
10. Each baseplate shall be constructed of one-piece folded mild-steel with structural members and shall be designed for no measurable deflection with the equipment mounted thereon and the baseplate supported around its perimeter.
11. Each base shall be designed so that all equipment bolted to it can be removed without access to the underside of the plate and with a flat top surface for ease of cleaning. Structural stiffeners shall be located under the compressors at the compressor anchor points.
12. Valves and piping within the enclosure shall be the compressor manufacturer’s standard. Relief valves shall be provided for equipment protection on the air and coolant systems as required.
13. Each compressor shall be provided with an integral, dry-type intake filter. Intake filters shall have replaceable filter element(s). Particle arrestance shall be not less than 99.9% efficient at 10 microns and above.
14. Each compressor shall be supplied in a sound attenuated enclosure. The enclosure shall reduce the measured sound to a maximum of 70 decibels, while the compressor is operating and the sound level is measured a distance of three feet from the enclosure.

15. A high air/fluid temperature shutdown system shall be provided. The unit must have safety devices mounted and wired. Safety devices shall include motor thermal overload and high compressor discharge temperature shut-down. These systems must be designed to prevent the compressor from running in an over-temperature situation or motor from running in an overload condition.

B. Refrigerated Dryer:
   1. An air dryer shall be provided of cycling refrigerated air type.
   2. The dryer shall produce an ISO Class 5, 7°C dew point at the dryer exit when operating continuously at the rating conditions of 2°C and RH of 60%.
   3. The dryer shall be capable of continuously drying the maximum discharge capacity of the air compressor.
   4. The dryer shall be integral or separately mounted to the compressor package.

C. Compressor System Particulate and Coalescing Oil Filters
   1. Replaceable-cartridge primary particulate and secondary high-efficiency oil-removal filters shall be provided for the compressor packages. Following both filters, the maximum particulate size removal shall be to 1 micron and coolant removal shall be to 0.1 mg/m3 at 21°C.
   2. The filters shall be rated for the maximum discharge capacity of the air compressor.

D. Compressor System Electrical:
   1. All electrical and control equipment for the air compressor module shall be furnished as required for a complete installation, requiring only field connection of 480 VAC, three phase power supply
   2. The compressor electric motor shall be rated 460 volts, 60 Hz, three phase and meet the requirements of Section 46 05 13.
   3. Remote mounted fusible disconnects with time delay fuses shall be provided by the Contractor.

E. Compressor System Control Panel:
   1. All control panel devices shall meet the requirements of Section 40 67 00.
   2. An enclosure-integrated control panel mounted on the compressor module shall include:
      a. Full voltage, non-reversing, motor starters sized as required by the manufacturer. Disconnects with time delay fuses shall be provided by others.
      b. Control power transformers shall have both primary leads fused, one secondary lead fused, and one secondary lead grounded.
      c. Control panel shall have short circuit current rating (SCCR) of 65 kA.
      d. Terminal blocks for all system wiring. Internal panel wiring shall be neatly bundled and tied and shall be identified with suitable wire markers
      e. Controller shall be provided to indicate the following conditions:
         1) Differential pressure across fluid filter.
         2) Discharge pressure.
         3) Compressor discharge temperature.
         4) Power on.
         5) Hours of operation.
         6) Operating mode.
         7) Differential separator.
         8) Percent capacity.
         9) Air filter.
      f. A contact which closes under alarm conditions shall be provided for the compressor for remote “FAIL” alarm. The contact shall close when any alarm occurs for the compressor.
      g. The control panel shall interface with the Plant Control System PLC via hard-wired I/O points. Discrete outputs shall be provided through dry, form C contacts, rated 5A at 120Vac. The following points shall be provided as minimum with additional points available per manufacturer recommendations:
         1) Air Compressor Running (Discrete Output).
         2) Dirty Filter Warning (Discrete Output).
         3) Common Alarm (Discrete Output, See Above).

F. Compressor System Performance and Design Requirements
   1. The compressed air equipment shall be designed for the following operating conditions:
      a. Ambient conditions:
         1) Maximum air temperature: 100 deg F.
         2) Minimum air temperature: 0 deg F.
         3) Relative humidity: 80%.
         4) Barometric pressure: 14.2 psia.
      b. Compressors:
         1) Number of units: 1 duty / 1 standby.
         2) Maximum discharge pressure: 104 psig.
         3) Capacity at operating target pressure: 44 CFM.
         4) Maximum Motor size: 10 HP.
         5) Maximum motor speed: 3600 rpm.
         6) Maximum free field noise ± 3 dB(A) when measured in free field conditions at a distance of 1 m according to ISO 1217: 70 dB.
      c. Receivers:
         1) Number of units: 1.
         2) Nominal volume: 120-150 gal.
         3) Receiver shall be external to compressors and located indoors.
         4) Solenoid valve to drain shall be powered by 120Vac NEMA 5-15 power cord.

2.07 SPARE PARTS:
A. Provide spare parts that are identical to and interchangeable installed parts:
   1. One (1) Air Control Valves (ACVs) rebuild kit.
   2. One (1) pilot air filter assembly.
   3. One (1) solenoid.
   4. One (1) valve plug and cable assembly.
   5. One (1) relay.
   6. One (1) 5-micron pilot air filter.
   7. One (1) compressor intake air filter element per compressor provided.
   8. One (1) compressor air-oil separator filter element per compressor provided.
   9. One (1) each compressor primary/secondary element per compressor provided.
   10. Any other standard parts recommend by the Manufacturer.

PART 3 – EXECUTION

3.01 INSTALLATION:
A. Make all electrical connections.
B. Install items in accordance with approved shop drawings, manufacturer's printed instructions and as indicated.

3.02 MANUFACTURER'S FIELD SERVICES:
A. Refer to DIVISION 1.
B. The services of a qualified manufacturer's technical representative shall be provided for installation inspection, testing, startup and training. The system manufacturer shall include the following site visits and days on site:
   1. Installation Inspection and Testing:
      a. Number of Trips: 2.
      b. Number of Days/Trip: 2.
   2. Compressor Installation Inspection and Testing:
      a. Number of Trips: 1.
      b. Number of Days/Trip: 1.

3. Startup and Training:
   a. Number of Trips: 1.
   b. Number of Days/Trip: 1.

3.03 FIELD PERFORMANCE TESTING AND GURANTEE:

A. All mixer components shall be field tested with the respective basins full to the maximum water surface elevation.

B. Exposed air piping shall be tested by Contractor for leaks using soapy water on all joints and applying 100 psi test pressure. Buried air piping shall be tested using this method before the trench is filled. Air piping in the tanks may be tested by submersing the piping in non-potable water and pressurizing the piping to 100 psi, in lieu of using soapy water on all joints. Pressure testing requirement shall not apply to supply piping downstream from VP or pre-manufactured nozzle headers.

C. The Contractor shall operate each mixing system at the maximum water surface elevation in the basins for a continuous period of not less than 72 hours. The Contractor shall correct and resolve all operating problems, deficiencies, etc., determined as a result of the tests.

D. After the above testing is complete, field mixing performance testing of the installed Air Mixing System shall be performed by the manufacturer as described below:
   1. Mixing performance testing shall be conducted in both basins.
   2. All personnel and equipment necessary to conduct and supervise all testing shall be provided by the mixer manufacturer. Engineer and Owner shall be notified of the test to witness at their option and expense.
   3. Prior to performing the tests, the basin which will be tested must have been in normal operating mode for at least two days with TSS in typical operating ranges of 50,000 – 70,000 mg/L. No flow shall enter or exit the respective basin for two hours prior to and during the test.
   4. The compressed gas mixing system manufacturer shall conduct total suspended solids (TSS) testing using a Cerlic TSS probe, or equal, suspended solids analyzer.
   5. Testing Procedure:
      a. Four horizontal-plane sample sites for the basin to be tested shall be selected by the Engineer. At each sample site, three vertical samples shall be collected as follows: 24-inches from the surface, tank sidewall mid-point and 24-inches above the tank sidewall bottom. Each sample site must be a minimum of 4 ft away from any structure within the tank. The samples for each location shall be analyzed as described above.
      b. The Coefficient of Variation (Cv) shall be determined for the sample set, excluding the maximum and minimum samples. The Cv shall be calculated by taking the resultant set of ten (10) samples as follows: Cv = (100 x Standard Deviation of Ten Samples)/(Mean Value of Ten Samples).“
      c. If the Cv is less than or equal to 10%, then the mixer performance shall be acceptable for that location.
      d. If the Cv is greater than 10%, then the mixer performance shall be unacceptable for that location and the Contractor and/or Manufacturer shall make all necessary improvements (at no additional cost to the Owner) and repeat the testing procedure at no additional cost to the Owner until the Cv is less than or equal to 10% for that location.

END OF SECTION 46 41 47

SECTION 46 51 21 - MEDIUM BUBBLE MEMBRANE DIFFUSERS

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section defines the requirements for the air diffusers, air piping manifolds and laterals, piping supports, anchor bolts, pipe anchors, and any additional materials required by the manufacturer's design to be installed to aerate and mix sludge in two (2) Thin Sludge Holding Tanks.

B. Manufacturer shall furnish necessary diffuser equipment and configuration to meet the specified criteria. All diffused aeration equipment shall be suitable for installation as indicated. Any revisions required as a result of the equipment manufacturer selected shall be the responsibility of the Contractor and be made at no additional cost to the Owner.

C. All equipment specified in this Section shall be fabricated, assembled, and tested in full conformity with Drawings, Specifications, engineering data, instructions, and recommendations of the equipment Manufacturer unless exceptions are noted by the Engineer. All equipment shall be provided by the same manufacturer and shall be suitable for installation. Any revisions necessary to accommodate the equipment furnished shall be the responsibility of the Contractor.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

A. Contract Drawings.
B. General Requirements: Division 1.
C. Concrete: Division 3.
D. Electrical: Division 26.
E. Aeration Blowers: Section 43 11 33 – Positive Displacement Blowers.

1.04 SUBMITTALS:

A. Submit as specified in Division 1.

B. All submittal data shall be labeled in English units. All Drawings shall be drawn to scale, and text shall be in English. Submittals utilizing only metric units will be rejected.

C. Shop Drawings:

1. Manufacturer's catalog information, descriptive literature, specifications, and identification of materials of construction.
2. Detailed mechanical drawings showing equipment fabrications and interface with other items. Include dimensions, size, and locations of connections to other work, and weights of associated equipment.
3. Detailed drawings of proposed aeration equipment layout showing air line sizes and lengths, air distribution headers, and location of diffusers, supports, and expansion joints. Drawings shall include plan, elevation, cross sections, and anchor locations.
4. Supports, vibrations, anchors shall be approved and sealed by a Missouri Licensed Engineer.
5. Diffuser, diffuser connector, balancing orifices, and system head loss curves covering range of airflow rates specified.
6. Complete aeration system headloss calculations shall be provided by Manufacturer. Headloss calculations shall be derived using air at standard conditions.
7. Calculations for air requirements and numbers of diffusers to be provided.
8. Suggested spare parts list to maintain the equipment for a period of two years and five years. Include a list of special tools required for checking, testing, parts replacement, and maintenance with current price information.

D. Information Submittals:

1. Special shipping, storage and protection, and handling instructions.
2. Routine maintenance requirements prior to startup.
3. Manufacturer's printed installation instructions.
4. Diffuser membrane longevity test reports as specified.
5. Performance test reports as specified.
6. Startup test reports and certificates.
7. Operation and Maintenance Manual:
    a. See Section 01300 - Submittals.
    b. Include manufacturer's written/printed installation instructions with erection drawings indicating, by piece marking, how entire assembly is to be shipped and field assembled.

E. Submit complete, signed report of results of field inspection, operation, adjustments, and tests. Include the Manufacturer's certificate that the equipment is ready for permanent operation and that nothing in installation will affect Manufacturer's warranty in any manner.

1.05 QUALITY ASSURANCE:

A. Refer to requirements in Division 1.

B. The Work requires that the medium bubble diffuser system, complete with all accessories and appurtenances be the end product of one responsible system manufacturer. Unless otherwise indicated, the Contractor shall obtain each system from the responsible supplier of the equipment, which supplier shall furnish all components and accessories as necessary to place the equipment in operation in conformance with the specified performance, features, and functions indicated without altering or modifying the Contractor's responsibilities under the Contract Documents. The Contractor is responsible to the Owner for providing the equipment systems as specified herein.

C. The Contractor and Manufacturer shall assume responsibility for the satisfactory installation and operation of the entire medium bubble membrane diffuser system and controls as specified.
D. All materials and equipment supplied shall be new and free from all defects that might affect installation and operation of this system.
E. A manufacturer's representative with complete knowledge of the equipment and installation as specified herein shall be provided under this section to assist in the installation, testing, startup, and training for the equipment.
F. Manufacturer of equipment must have experience in the design and manufacture of the type of apparatus proposed. Manufacturer must be able to reference at least three similar installations, three years or older currently in operation.

1.06 DELIVERY:

A. Deliver, store, and handle all equipment and materials in a manner to protect equipment condition, to prevent damage from exposure to the elements, and in accordance with requirements of Division 1.

1.07 WARRANTY:

A. As specified in Division 1.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. Environmental Dynamics, Inc.
B. SSI Aeration.
C. Gummi Jaeger Aeration
D. Sanitaire.

2.02 DESIGN CRITERIA:

A. The influent to the Sludge Holding Tank consists of waste activated sludge from the aerated granular sludge process.
B. The aeration equipment shall mix and transfer oxygen in the basin contents by diffusing air into waste sludge.
    1. Solids Concentration: 0.5% to 2.0%.
    2. pH Range: 5.5-7.5.
    3. Temperature: 50-86 °F.
    4. Allowable diffuser mounting distance above basin floor:
        a. Minimum (Inches floor-to-diffuser element): 10.
        b. Maximum (Inches floor-to-diffuser element): 12.
    5. Basin Dimensions:
        a. Number of Sludge Holding Tanks: 2
        b. Length: 30 ft.
        c. Width: 37.5 ft.
    6. Minimum Sidewater Depth: 4ft
    7. Maximum Sidewater Depth: 20 ft.
    8. Maximum Volume Per Tank: 168,322 gallons

9. Total Airflow per Tank: 1,200 scfm per Tank
10. Maximum Available Pressure(psig): 11.5 psig at a maximum air rate of 1,200 scfm including static pressure, pressure loss through air piping, and pressure loss through the membrane.

2.03 GENERAL:

A. Shop fabricate welded metal parts and assemblies from Type 304L stainless steel conforming to ASTM A312 and A788. Field welding of stainless steel is not acceptable.

B. Shop fabricate nonwelded parts and pieces from sheets and plates of Type 304 stainless steel conforming to ASTM A240, unless specified otherwise. After fabrication, pickle and passivate stainless steel assemblies per ASTM A380 and parts by immersion in a pickling solution of 6% nitric acid and 3% hydrofluoric acid at 140°F (60°C) for 15 minutes. Neutralize by immersing in a hot water bath.

C. Header and Header Support System: Allow for expansion and contraction over a temperature range of 125°F when installed.

2.04 PERFORMANCE REQUIREMENTS:

A. Airflow Rate Output shall not differ by more than 10%, at minimum and maximum airflows, for any two system diffusers (based on diffuser with lower flow rate).

B. Air Distribution and Balancing: Control by use of orifices and proper header size selection only.

C. Do not use flow distribution control devices requiring automatic or manual operation.

D. Provide adequate mixing as defined by the following: the variation in suspended solids (total residue) shall be less than 10% between the mean value of samples taken at any two depths along any vertical line extending between water surface and elevation of the top of diffusers. Refer to paragraph 3.02.

2.05 DROPLEG, AIR MANIFOLD, AND DISTRIBUTION HEADERS:

A. Dropleg:
1. Diffuser manufacturer shall provide a Schedule 10 stainless steel dropleg to a point two (2) feet above the manifold for each Thin Sludge Holding Tank. A stainless steel flange will be provided at the end of each dropleg. Thickened Sludge Tank will be provided as shown on the Contract Drawings. The diffuser manufacturer will be responsible for providing a complete aeration system below the air main connection. As an alternative to a flanged connection, the diffuser manufacturer may coordinator with the contractor to provide a plain end stainless steel dropleg. The diffuser manufacturer shall be responsible for providing any required transition coupling for joining the stainless steel dropleg and the CPVC dropleg
2. Dropleg material shall be Type 304 stainless steel.
3. Transition to Schedule 40 CPVC shall occur 2 feet above the basin floor. If the CPVC to stainless connection is flanged, gasket between the flanges shall be suitable for a near wall temperature of 250 degrees F.

B. CPVC Air Manifold:
1. Perpendicular to air distribution headers, same nominal pipe size as Dropleg.
2. Connect air manifold to distribution headers at common pipe centerline. Manifold shall act as drainline.
3. Fabricate with minimum 4-inch diameter fixed threaded union of flanged joint connections to each air distribution header to prevent rotation and blow apart.
4. Fabricate manifolds in section up to 30 feet in length.

5. Construct from Schedule 40 CPVC. Piping, pipe joints, and supports shall be provided for long term exposure to 125 degrees F mean-wall temperature.

C. Distribution Headers:
   1. Minimum 3-inch Schedule 40 CPVC or equivalent wall thickness.
   2. Fabricate in sections up to a maximum of 20 feet in length, with fixed joints or expansion joints as required.
   3. Fabricate with diffuser element holders factory solvent welded to crown of header or with holed drilled for saddle mounted diffusers to be installed in the field. Attach diffuser elements to distribution headers to resist a dead load of 200 lbs applied vertically to the outer edge of the diffuser holder.
   4. Distribution headers shall be grouped, as necessary, to allow easy access for maintenance.
   5. Maximum spacing between distribution headers shall be as required by the manufacturer to maintain mixing and aeration.

D. Include an expansion/contraction system consisting of fixed joints and guide type supports. Fixed joints shall be positive-locking, anti-rotational flanged or threaded couplings. Longitudinal movement of piping shall be accommodated by sliding through non-gripping guide type supports.

2.06 FLEXIBLE MEMBRANE DIFFUSER ASSEMBLIES:

A. Diffusers type shall be non-clog medium bubble or low pressure type, suitable for intermittent or constant operation in sludge with up to 2.0% total solids.

B. Air diffusers shall be of the non-clog membrane disc or tube type with a flexible perforated air release membrane.
   1. Tube Membranes: Tube membranes shall provide a maximum of 380 in^2 of porous surface area each
      a. Diffuser tube shall be Schedule 40 CPVC and difuser membrane shall be EPDM
      b. Connection to air piping header shall be by saddle connection with stainless steel hardware.
   2. Disc Membranes: Maximum disc diameter shall be 9 inches. Hold down assembly shall consist of a threaded retainer ring with O-ring gasket assembly. Systems requiring multiple screws or bolts with a flange and gasket assemblies are not acceptable. Single through-bolt assemblies are not acceptable.
      a. CPVC Diffuser Element Holders:
         (1) Provide support plate to form an air plenum under the diffuser and support for the membrane when the air is off.
         (2) Mechanism to attach diffuser element to element holder.
         (3) Provide complete peripheral edge support for membrane diffuser.
         (4) Each diffuser element holder shall have an airflow control orifice.
         (5) Design distributors and holders to resist a dead load of 200 lbs applied vertically to the outer edge of the diffuser holder.
      b. Retaining Device:
         (1) Securely hold and seal diffuser element to element holder.
         (2) Diffuser Assembly and retaining device shall prevent air escape at diffuser element sealing gasket interface.
         (3) Design retainer ring threads with minimum cross section of 1/8 inch and allow for one complete turn to engage threads.

C. Backflow preventer assembly to prevent liquid from passing into aeration header. Diffusers shall require no special tools for attaching diffusers to diffuser connectors. If special tools are required, manufacturer shall provide the necessary tools to complete install.

D. Membrane: Ethylene propylene diene monomer (EPDM) suitable for application to continuous aeration of waste activated sludge without significant increase in headloss.
   1. Add carbon black to the material for resistance to ultraviolet light
   2. Replaceable without use of any special tools.
   3. Exterior surface shall be smooth to restrict biological film growth.
   4. Inflate during aeration and deflate when airflow is discontinued, further restricting biological film growth.
   5. Suitable for "Bumping" type cleaning.
   6. After 1 year of continuous operation without basin dewatering or diffuser cleaning, the pressure drop through the diffuser shall be measured at a flow rate of 1.0 cfm per diffuser. If the pressure has increased more than 0.5 psi compared to the pressure drop of a new diffuser membrane, then the basin shall be dewatered, and the diffusers cleaned. If the pressure of the diffusers is still greater than 0.5 psi over that of a new diffuser, then he manufacturer shall provide replacement membranes at no extra cost.
   7. Membrane Longevity:
      a. Longevity of the proposed membrane diffusers shall have been demonstrated in at least three full-scale municipal installations operating continuously for a minimum of three years.
      b. Test reports, prepared by an independent testing agency, shall confirm membrane longevity through compliance with the maximum allowed percent (plus or minus) change in each membrane property indicated. Tests conducted in-house by the Supplier shall not be acceptable. Data for a minimum of three diffusers from each installation shall be provided.

Property	Maximum Percent Change
Durometer	5%
Weight	5%
Permanent Set	0.5%

2.07 SUPPORTS AND ANCHOR BOLTS:

A. Fabricate from glass fiber reinforced polypropylene (GFPP) or Type 304 stainless steel, ASTM A240. Use Type 304L stainless steel for welded parts, ASTM A240.
   1. Support spacing to be limited to a maximum of 8 feet.
   2. Design all supports to allow for thermal expansion and contraction forces over a temperature range of 125° F (mean wall) and to minimize stress build up in the piping system.
   3. Design supports to be adjustable without removing the air distribution header from the support.
   4. Manifold Support – 6-inch diameter and larger
      a. Design supports to include hold down guide straps, support structure and anchor bolts.
      b. Design guide straps with a 2 inch minimum width to eliminate point load on manifold and minimize binding.
      c. Design support for a total of 4 inch vertical adjustment for leveling of manifold.
      d. Attach supports to tank floor with stainless steel anchor bolts.
   5. Air Distributor and Manifold Supports – 3 and 4-inch diameter

a. Provide guide and fixed type supports to allow expansion/contraction.
b. Design supports to include hold down straps, support structure and anchor bolt.
c. Design support for a total of 3 inch vertical adjustment for leveling air distribution headers within ¼ inch of a common plane.
d. Guide support
   (1) Guide straps to have 1 1/2-inch wide top and bottom contoured bearing surface with chamfered edges to minimize binding and resistance to movement of air distributor under full buoyant uplift load.
   (2) Design strap with 1/8 inch clearance around distributor so strap is self-limiting and cannot be over tightened.
e. Fixed supports
   (1) Fixed straps to have 1 1/2 inch wide top and bottom contoured bearing surface with punched burrs to positively grip the air distributor when tightened.
   (2) Design strap to be self-limiting to prevent stressing the distributor if the clamp is overtightened.

B. Anchor Bolts:
   1. Attach supports to basin with Type 304 stainless steel anchor bolts. Provide a chemical bond adhesive anchor bolt system.

2.08 DRAINLINE, SUMP, AND PURGE:

A. CPVC System: To drain entire submerged aeration piping system. The grid shall have an integral sump built into the air manifold header.
B. Sump:
   1. Bottom elevation shall be lower than invert of air distribution headers.
   2. Connect to a 1-inch diameter CPVC purge line extending from sump invert elevation to a point approximately 3-ft, 6-in above holding tank platform and terminate with a stainless steel ball valve.

2.09 HEADER JOINTS:

A. Special Flanged Joints or Between Section of Air Distribution Header:
   1. Connect air distribution header sections with threaded union or flange joints to prevent blow apart and rotation.
   2. Flanged Joints for Stainless Steel Piping: Face ring-follower flange type with through-bolts, capable of transmitting longitudinal forces caused by expansion and contraction in air distribution header.
B. Fixed Joints for CPVC Piping: Spigot section solvent welded to one end of a Distribution Header, a threaded socket section welded to mating distribution Header, and O-ring gasket and a threaded screw-on retainer ring.

2.10 APPURTENANCES:

A. Couplings: Van Stone type flanges ASTM A182 Type 304 stainless steel drill 150-pound ANSI B16.5 standard.
B. Face Rings: Stainless steel, ASTM A240, Type 304L, inside diameter (ID) drilled 1/16-inch larger than pipe outside diameter (OD).
C. Gaskets: Neoprene, 45 to 55 durometer; locate at expansion joints and couplings to form an airtight connection at 20 psig minimum.

D. Miscellaneous: Nuts, bolts, washers, and other nonwelded parts: Type 304 stainless steel, ASTM A240. Threaded assemblies shall be chemically treated or lubricated prior to assembly to prevent galling.
E. Anchors: Type 304 stainless steel expansion anchors (1/2 inch by 4-1/2 inches), unless otherwise indicated or specified.

2.11 SPARE PARTS AND SPECIAL TOOLS:
A. At a minimum, furnish, tag, and box for shipment and storage spare parts and special tools summarized below:
1. Diffuser Assemblies 3% of original quantity.
2. Joint Assemblies: six (6).
3. Couplings: six (6).

PART 3 - EXECUTION

3.01 INSTALLATION:
A. Install in accordance with these specifications and in accordance to manufacturer's instructions.
B. Diffusers shall be installed level as per manufacturer's recommendation or as specified, whichever is more stringent.

3.02 FIELD QUALITY CONTROL:
A. Level Test: The Thin Sludge Holding Tanks shall be flooded with non-potable water to the tops of the diffusers. The level of the diffusers shall then be checked to ensure that they are at the same elevation with plus or minus 0.125-inch. The elevations of the diffuser assemblies shall be adjusted as necessary.
B. Uniformity and Leakage Tests: The Thin Sludge Tanks shall be flooded to a depth of approximately 1-foot above the tops of the diffusers. Process air shall be supplied to the header in the tank. The surface of the water above the diffusers shall then be visually inspected for leaks and to ensure that airflow is uniformly distributed across the tank. Any leaks or non-uniformity discovered shall be repaired to full satisfaction of the Engineer.
C. Performance Test:
1. Perform under actual or approved simulated operating conditions. Airflow shall be as measured by plant instrumentation.
2. Test for a continuous 3-hour period without malfunction.
3. Adjust, realign, or modify units and retest if necessary.
4. Test as follows:
a. Pressure Test: Measure air pressure immediately upstream of elbow located at top of each dropleg, and at maximum airflows and submergences stated in paragraph 2.02.
b. Mixing Test (refer to paragraph 2.04):
(1) Perform at airflows stated in paragraph 2.02.
(2) Select three vertical lines and two depths in the sludge holding tank.
(3) Take three samples at each of two depths along each vertical line using Van Dorn sampler.
(4) Independent testing laboratory approved by Engineer will perform residue test on each Sample. Mean value of total residue for three samples at each depth will be used to determine conformance with requirements.

(5) All testing and sampling shall conform to procedures established in latest edition of Standard Methods for Examination of Water and Wastewater.

3.03 MANUFACTURER'S SERVICES:

A. As specified in Division 1 and as follows:

B. The equipment suppliers shall furnish the services of a factory-trained representative on site for a period of no less than three days (two visits). The representative shall inspect, adjust, calibrate and place into operation the system, then train Owner operating personnel in its use for a minimum of two sessions, two hours each. If additional services are required to produce a fully operational system, they shall be provided at no cost to the Owner.

C. After installation and after all equipment and components are in operable condition, a field mechanical and electrical performance test shall be performed in the presence of the Engineer.
   1. Each piece of equipment shall be tested for normal start, stop, and emergency stop cycles.
   2. Each piece of equipment shall be field tested and the equipment calibrated to demonstrate to the Engineer that all equipment will satisfactorily perform the functions and criteria specified.
   3. Furnish test forms and procedures for field testing and provide all test apparatus required at no additional cost to the Owner.
   4. Follow testing procedures recommended by the equipment manufacturer and approved by the Engineer.
   5. The equipment supplier shall modify or replace any equipment necessary to obtain satisfactory performance.

D. All labor, materials, and test apparatus necessary for conducting the above tests shall be furnished by the Contractor at no additional cost to the Owner, unless stated otherwise.

3.04 MANUFACTURER'S CERTIFICATE(S):

A. Provide manufacturer's certificate(s) in accordance with Division 1.

END OF SECTION 46 51 21

SECTION 46 53 60 – GRANULAR SLUDGE BIOLOGICAL TREATMENT SYSTEM

PART 1 - GENERAL

1.01 SUMMARY:

A. This section contains the requirements to furnish the design and equipment for a Granular Sludge Biological Treatment System (Treatment System) for the treatment of domestic wastewater. This section also specifies the overall performance requirements of the supplied Treatment System and includes the procurement, installation and operation of the biological treatment system and related services from the Equipment Supplier in accordance with the information contained herein. The Supplier will be responsible for the confirmation of the design of the bioreactors and provide a performance warranty of the biological process to meet permit requirements.

B. Description of Overall Treatment Process:

1. The system is for use in treating wastewater at the Todd Creek Wastewater Treatment Plant (TCWWTP).
2. Raw wastewater enters the treatment process at the existing influent screening structure, which includes an automatically cleaned, 1/4-inch-spaced mechanical bar screen. Screened effluent is discharged into a new influent wet well and subsequently pumped to the new wastewater treatment plant site. Influent wastewater passes through 1/4-inch automatically cleaned perforated plate screens and a stacked tray grit removal system. Screened and degritted influent flows into a header that serves the Treatment System. The Treatment System consists of four AGS Basins operated in parallel, with influent fed to one reactor at a time. The Equipment Supplier shall provide all non-concrete tank internals, pumps, instrumentation, and automatic valves required for complete operation of the treatment system.
3. Each basin in the Treatment System shall be capable of operating independently of all other basins including influent flow, effluent discharge, sludge withdrawal, and water level correction withdrawal, as outlined in these Specifications and on the Contract Drawings. The basins shall be synchronized to prevent sludge withdrawal from simultaneously occurring in more than one basin.

C. Requirements and materials not specified herein shall be selected by the Equipment Supplier for specified performance requirements and environmental conditions based on standard practice. The Equipment Supplier shall provide the required major equipment components, including but not limited to:

1. Biological process design calculations to assure the Treatment System can meet all performance requirements listed in this specification. Any process equipment provided by Others shall be recommended and approved by the Equipment Supplier for use as a single point of responsibility of the performance guarantee.
2. All motor-actuated and/or automatic valves required for a complete functional system:
    a. Influent header motor-actuated plug valves for each reactor (1 duty / 1 standby for each basin, 8 total).
    b. Air header motor-actuated air flow control valves (1 per basin, 4 total).
    c. Small air supply motor-actuated valves (2 per basin, 8 total).
    d. Sludge withdrawal and water level correction motor-actuated plug valves for each reactor (2 per basin, 8 total).
    e. Motor-actuated plug valves for influent to each of two (2) Sludge Buffer Tanks (2 total).
3. All internal reactor piping and connections as coordinated with Design Engineer.
4. Fine bubble diffuser grids for each AGS Basin, including drop leg to top of reactor wall.

5. Sludge / liquid withdrawal piping grid for each AGS Basin with any required air piping connections to top of reactor wall.
6. Effluent overflow weir launder system for each AGS Basin.
7. Five (5) positive displacement blowers in a 4 duty / 1 standby configuration.
8. Intake silencers for installation interior of the Blower Building for each blower provided.
9. Intake filter / silencer assemblies for installation exterior of the Blower Building for each blower provided.
10. Pumps for sludge processing system:
    a. Three (3) Sludge Pumps.
    b. Three (3) Supernatant Pumps.
11. Two (2) Water Level Correction (WLC) Pumps.
12. Furnish a complete operations and instrumentation package to control the Treatment System. The package shall consist of the following at a minimum:
    a. Furnish packaged equipment and devices with instrumentation and controls as specified.
    b. Furnish all instruments, meters, gauges, switches, controllers, thermometers, indicators, and transmitters as required for a complete system.
    c. Furnish instrumentation as required to properly monitor and control the equipment supplied by this Contract in a fully automatic mode. Include instrumentation for all equipment operation including startup, normal and shutdown modes.
    d. Design, shop install, and test all skid-mounted instruments.
    e. Furnish all materials for complete installation of shipped-loose instrumentation. Coordinate the physical arrangement and mechanical connections with equipment and structures furnished in this Section with the Design Engineer.
    f. Furnish and program a Programmable Logic Controller and Operator Interface Terminal (OIT) as specified for proper control and operation of the system. Design and factory acceptance test the complete main control panel.
    g. Provide controls integration for the complete system.

D. Work by Others:
1. Concrete Treatment System Basins.
    a. Four (4) AGS Basins, including concrete center effluent trough.
    b. Two (2) Sludge Buffer Tanks.
    c. One (1) Water Level Correction Tank.
2. Utility corridor with influent, sludge, and water level correction piping and appurtenances as required, including the following components.
    a. Influent check valves.
    b. Influent flow meters.
    c. Influent wastewater TSS instrument.
3. Utility corridor for pumping systems including the following components:
    a. Check valves.
    b. Sludge, supernatant, and WLC flow meters.
4. Air piping between blowers and reactor, up to the top of interior basin wall.
5. Sludge and WLC piping exterior of the AGS Basins.
6. All manually-operated valves shall be provided by Contractor.
7. Motor control centers, motor starters, and variable frequency drives shall be provided by the Contractor for all equipment without integral control equipment.
8. Configuration of the plant control system network.

1.02 RELATED WORK SPECIFIED ELSEWHERE:

A. Section 01
B. Section 01433 – Manufacturers Field Services
C. Section 01664 - Training
D. Section 01757 – Commissioning
E. Section 09 90 00 – Protective Coatings.
F. Section 33 11 00 – Pressure Piping.
G. Section 33 12 16 – Utility Valves and Accessories.
H. Section 40 66 00 – Process Control Networks.
I. Section 40 67 00 – Process Control Panels and Hardware.
J. Section 40 70 00 – Instrumentation For Process Systems.
K. Section 43 11 33 – Positive Displacement Blowers.
L. Section 46 05 13 – Common Motor Requirements for Water and Wastewater Equipment.

1.03 EXCEPTIONS TO WORK SPECIFIED ELSWHERE:

A. Aqua Aerobics International standard training, commissioning, and startup services shall take precedent over Div 1.

1.04 REFERENCES:

A. Applicable Standards:
   1. American National Standards Institute (ANSI).
   2. American Water Works Association (AWWA).
   3. National Sanitation Foundation (NSF).

1.05 SUBMITTALS:

A. Furnish submittals in accordance with SECTION 01300 - SUBMITTALS.
B. Initial Design Deliverables shall be submitted according to the schedule provided in the Bid Form.
   1. Biological design information on the following at a minimum:
      a. Process Flow Diagram.
      b. Tank Configuration and Volumes.
      c. Equipment Confirmation and Sizing.
      d. Sludge, WLC withdrawal rates.
      e. Sludge, supernatant, and WLC design flow ranges.
      f. Oxygen Demand.
      g. Sludge Production.
      h. SRT/HRT.
      i. BioWin Model demonstrating treatment at maximum month design loading.
   2. Assembly and installation drawings including arrangement, layout, and dimensions of all basin/tank internal components. Provide plan elevation views of all major components and subsystems, detailing orientation of equipment, piping, fittings, and valves (including valve actuators) and necessary supports for the equipment.
   3. Three-dimensional models of all equipment. Electronic copies of all models shall be provided in Revit Version 2024 or compatible alternative.
   4. P&ID drawings clearly identifying the termination points for piping connections, and electrical connections on the P&ID drawings where interfacing of the Treatment System supplied equipment and Contractor supplied equipment and/or piping exists.

5. Complete Bill of Materials including quantity, manufacturer, and custom tag number referenced to the P&IDs. The custom tags shall be developed by the Design Engineer and Owner. The Equipment Supplier shall not create their own tagging system.
    a. Equipment Supplier shall provide literature and Engineering data and specifications including dimensions, materials, size, and weight of major components.
6. Hydraulic calculations for reactor influent distribution grids and sludge/WLC withdrawal grids across the range of anticipated flows in tabular form.
7. Detailed design specifications, design criteria, and design calculations for pumps, blowers, and other ancillary equipment.
8. Basin dimensional requirements.
9. Anchorage requirements and details for all supplied mechanical equipment, influent distribution grids, sludge/WLC withdrawal grids, and effluent lauders.
10. Detailed control package summary including detailed control equipment cabinets layouts, associated cabinet wiring diagrams, I/O lists, alarms, control loops, and integration of associated ancillary equipment.
11. Detailed Control Narrative describing how the Treatment System operation works. The control narrative should describe the operation of the system in various operating modes including Hand and Auto.

C. Shop Drawings:
1. Provide setting drawings, templates for the installation of anchor bolts and other anchorage systems.
2. Final P&IDs, General Arrangement Drawings.
3. Complete power and control wiring diagrams and schematics with all field revisions.
4. Bill of Materials with Quantities for major electrical and control components like PLCs, OITs, Ethernet Switches etc.
5. Product Data: Submit the following for each type of product specified and included as minimum:
    a. Data sheets for all control panel components furnished.
6. PLC Control Panels: Provide the following as minimum:
    a. Fabrication drawings, front elevation, wiring diagrams, and bills of material for control panels.
    b. Electrical connection diagrams showing termination locations for all field wiring. External connection diagrams shall indicate cable number and wire color for field cables terminated at the panel.
    c. Engraving schedule and physical dimensions for nameplates.
    d. Provide heat dissipation calculations for all panels containing programmable logic controllers. Include calculation for ventilation fans if required.
7. Operator Interface Terminal (OIT) touch screen layouts (for each screen) subject to Owner and Engineer approval.
8. Testing Protocol. Submit to the Contractor and Owner, the Treatment System testing protocol as indicated below.
9. I/O list for SI programming of client SCADA system.
10. Final PLC program copy with complete documentation to be submitted after startup and acceptance of the system. The program shall be provided with the final O&M materials and stored on flash media.

D. Quality Control Submittals
1. Equipment Supplier’s Certificate of Proper Installation
2. Special shipping, storage and protection, and handling instructions for all components.
3. Equipment Supplier’s written/printed installation instructions.

4. Routine maintenance requirements prior to plant startup.
5. Two (2) hard copies and one (1) electronic copies of the Operation and Maintenance Manuals for the Treatment System and all associated equipment O&M Manuals. The Manuals shall include complete operations and maintenance manuals, maintenance procedures, spare parts lists, and field procedures according to SECTION 01300 – SUBMITTALS.
6. The Equipment Supplier's instructions for the handling, long and short-term storage, installation, maintenance, and cleaning of all provided equipment.
7. Maintenance procedures spare parts lists, and field procedures.

1.06 SITE CONDITIONS:

A. All Equipment provided as part of this system shall be rated for the temperature, seismic and elevations as specified in Section 01810 – Project Design Criteria and its appendices.

1.07 SYSTEM WARRANTIES:

A. A Process Performance Warranty shall be provided by Equipment Supplier for the Treatment System per the requirements outlined in Section 2.02 Treatment System Design Criteria, Section 3.03 Performance Test and Section 3.04 Monitored Test Period. This warranty shall include the required effluent values for BOD, TSS, TN, NH_3-N, and TP. The Process Performance Warranty shall be based on demonstrating the specified performance during a 60-day Performance Test, and maintenance of performance through the Monitored Test Period. The warranty shall include a protocol for provisions to make process adjustments, replace equipment and make any other modifications necessary to maintain plant performance through the warranty period.
   1. Equipment Supplier shall furnish a two-year, non-prorated, Process Performance Warranty. Required effluent values for BOD, TSS, TN, NH_3-N, and TP shall be met as long as Influent Wastewater Quality is maintained at or below the values listed in Section 2.02.
   2. The two-year warranty shall commence after the Performance Test has been successfully completed. The Equipment Supplier shall retroactively set the beginning of the warranty period at the date with which the process met and maintained the effluent requirements, up to a maximum of 60 days prior to the end of the Performance Test.

B. Equipment Supplier shall furnish a two-year, non-prorated, materials and workmanship warranty for all components comprising the Treatment System unless otherwise noted. Warranty shall be for two (2) years from the date of successful completion of commissioning activities as described in Section 3.02.

PART 2 - PRODUCTS

2.01 ACCEPTABLE TREATMENT SYSTEMS:

A. Aerated Granular Sludge (AGS) treatment system package, as provided by Aqua Nereda / Aqua Aerobics Systems, Inc.

2.02 TREATMENT SYSTEM DESIGN CRITERIA:

A. The Equipment Supplier shall provide the biological system design calculations to assure the Treatment System can meet all performance requirements listed in this specification.

B. Treatment System shall provide biological phosphorus removal without incorporation of a chemical phosphorus removal system.

C. The Treatment System shall be designed to remove phosphorus, biological oxygen demand, ammonia, and total nitrogen at a maximum month flow of 7.96 MGD. The biological system shall meet the following design criteria:
   1. Design Conditions:
      a. Average Day Flow (ADF): 4.59 MGD
      b. Maximum Month Flow (MMF): 7.96 MGD
      c. Peak Day Flow (PDF): 12.3 MGD
      d. Minimum Temperature: 10°C
      e. pH: 6.5-8.5
      f. Site Elevation: 915 ft
   2. Influent Wastewater Characteristics:

	Average Day	**Maximum Month**	**Peak Day**
BOD_5, lbs/d	7,200	13,300	16,800
TSS, lbs/d	7,600	15,400	23,500
TKN, lbs/d	1,600	2,230	3,180
TP, lbs/d	270	380	540

   3. Effluent Wastewater Quality Requirements:

Parameter, Units	**30-Day Avg**	**7-Day Avg**	**Daily Max**
pH, su	-	-	6.0-9.0
BOD_5, mg/L	15	15	-
TSS, mg/L	20	30	-
Oil and Grease, mg/L	10	-	15
Ammonia, mg/L	1.8 (Jan) 1.8 (Feb) 1.8 (Mar) 1.4 (Apr) 1.2 (May) 0.6 (June) 0.4 (July) 0.6 (Aug) 0.7 (Sept) 1.3 (Oct) 1.8 (Nov) 1.8 (Dec)	-	8.4 (Jan) 8.4 (Feb) 8.4 (Mar) 6.9 (Apr) 8.4 (May) 6.9 (June) 6.9 (July) 8.4 (Aug) 6.9 (Sept) 6.9 (Oct) 8.4 (Nov) 8.4 (Dec)
Total Phosphorus, mg/L	1.0	-	-
Total Nitrogen, mg/L	8.0	-	-

D. Include biological design information on the following, at a minimum:
   1. Process flow diagram.
   2. Tank configuration and volumes.
   3. Sludge and WLC withdrawal flows.
   4. Oxygen demand.
   5. Sludge production.
   6. SRT/HRT.

E. Treatment System shall be designed for four (4) AGS Basins, each with the dimensions below:

1. Reactor Width: 75 feet
2. Reactor Length: 80 feet
3. Maximum Sidewater Depth: 22 feet
4. Aeration Sidewater Depth: 21 feet
5. Top of Reactor Wall: 24 feet

F. Treatment System sludge processing system shall be designed for two (2) Sludge Buffer Tanks, each with the dimensions below:
1. Reactor Width: 20 feet
2. Reactor Length: 28 feet
3. Maximum Sidewater Depth: 14.2 feet
4. Top of Reactor Wall: 24 feet

G. Treatment System water level correction system shall be designed for one (1) WLC Tank with the dimensions below:
1. Reactor Width: 20 feet
2. Reactor Length: 20 feet
3. Maximum Sidewater Depth: 14.4 feet
4. Top of Reactor Wall: 24 feet

2.03 AERATION EQUIPMENT:

A. Equipment Supplier shall design aeration control system based on a common air discharge header with modulating control valves at each basin to balance air between basins as needed to meet process performance demands. A control system with blowers dedicated to individual basins shall not be acceptable.

B. Butterfly valves for air service:
1. All butterfly valves shall be provided with stainless steel disc, and FKM valve seat. All internal materials must be compatible with the highest anticipated blower discharge temperature and 25 degrees F safety factor.
2. Equipment Supplier shall provide four (4) electrically operated, modulating service butterfly valves for controlling airflow to each basin.
   a. Valves shall be 10-inch with lug-style or flanged connections.
   b. Electric motor actuators shall be 460V, 3ph, 60Hz service.
   c. Actuators shall include motor winding protection, integral disconnect switch (NEMA 4X), manual override and limit switch feedback to allow monitoring of valve position and whether valve is open or closed.
   d. Actuators shall include local controls, including push buttons for opening / closing, selector switches for placing actuator in hand or remote, and indicator lights to identify if valve is open / closed and if the valve is in a fault mode.
   e. Modulating electric motor actuator shall include the following control signals, at minimum:
      (1) Discrete outputs:
         (a) Dry contacts rated 5A, 120Vac.
         (b) Signals:
            i) Open limit switch.
            ii) Closed limit switch.
            iii) In-Remote status.
      (2) Discrete inputs:
            i) Open/Close.
      (3) Analog output:
         (a) 4-20mA range.

i) Position control.
ii) Position feedback.

3. Equipment Supplier shall provide eight (8) electrically operated, open/close service butterfly valves for use with the air supply at each basin.
   a. Valves shall be 4-inch with lug-style or flanged connection.
   b. Electric motor actuators shall be 460V, 3ph, 60Hz service.
   c. Actuators shall include motor winding protection, integral disconnect switch, manual override and limit switch feedback to allow determination whether valve is open or closed.
   d. Actuators shall include local controls, including push buttons for opening / closing, selector switches for placing actuator in hand or remote, and indicator lights to identify if valve is open / closed and if the valve is in a fault mode.
   e. Open/close electric motor actuator shall include the following control signals, at minimum:
      (1) Discrete outputs:
         (a) Dry contacts rated 5A, 120Vac.
         (b) Signals:
            i) Open limit switch.
            ii) Closed limit switch.
            iii) In-Remote status.
      (2) Discrete inputs:
            i) Open/Close.

C. Aeration Blowers:
   1. Equipment supplier shall provide blowers sized to accommodate projected peak day loadings into the WWTP, as indicated in Section 2.02C.1. The blowers shall be provided with a 4 Duty / 1 Standby arrangement. Other blower arrangements shall be subject to Design Engineer Approval.
   2. Aeration Blowers shall be positive displacement type and shall be as specified in Section 43 11 33 Positive Displacement Blowers.

D. Aeration Blower Intake Filter / Silencer Assemblies:
   1. Equipment supplier shall provide five (5) intake filter / silencer assemblies, as specified in Section 43 11 33 under Series 400 Blowers.

E. Aeration Blower Intake Silencer Assemblies:
   1. Equipment supplier shall provide five (5) intake silencer assemblies, as specificed in Section 43 11 33 under Series 400 Blowers.
   2. Equipment supplier shall coordinate connections to blower piping with Design Engineer.

F. Air Flowmeter:
   1. Function: Continuously measure, indicate, and transmit signals proportional to air flow being supplied to each AGS Basin. Each air flow meter shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
   2. Provide one (1) air flowmeter for each AGS Basin as specified in Section 2.11.

2.04 AGS BASIN, SLUDGE BUFFER TANK, AND WLC TANK INTERNALS

A. Treatment System shall be provided with tank internals required for a complete system. All piping connections shall be within 48 inches of reactor wall, and shall be coordinated with Design Engineer.

B. Fixed Fine Bubble Diffuser System:
   1. Equipment Supplier shall provide a complete fine bubble membrane diffuser system for each AGS Basin, with flanged dropleg connection located at the top of the reactor wall

for transition to contractor provided piping. Equipment Supplier shall provide dropleg connection for each independent diffuser grid provided.

2. Dropleg shall be minimum SCH10 304L stainless steel with 150# flange connection at top of dropleg.
3. Provide a manifold for connection to the air distribution headers. Fabricate maximum 30 feet long manifolds with threaded union or flanged joints to connect manifold sections and to connect to the air distribution headers to prevent rotation and blow apart. Fabricate manifolds of Schedule 40 CPVC conforming to ASTM D1784, D1785 and D2466. Design piping, pipe joints and supports to resist expansion/contraction thrust forces of the air distribution headers over a temperature range of 250°F. CPVC components to be produced from CPVC compound with a minimum tensile strength of 7000 psi. Design manifolds to withstand 180° F mean wall temperature. CPVC components shall have minimum 1.5 percent titanium dioxide to minimize ultraviolet light degradation. Factory solvent weld all CPVC joints and diffuser holders.
4. Fabricate maximum 24 feet long air distribution headers with diffuser holders factory solvent welded to the crown of the pipe for positive air seal and strength. Fabricate minimum 4-inch diameter air distribution headers conforming to ASTM D3915 and D3034. Connect air distribution header sections with threaded union or flange joints to prevent blow apart and rotation. Design joints with mating halves factory solvent welded to the ends of the air distribution header. Design threaded union joints with spigot and socket ends joined with a threaded ring and sealed with an O-ring gasket. Design union joints with threads of a minimum of 0.013 square inches to provide adequate strength of the socket and retainer ring. Design flange joints with an angle face ring, follower flange with 150 lb drilling and stainless-steel hardware. Diffuser holders shall have a continuous contact area of 13 square inches minimum to ensure structural integrity. Air distribution headers and diffuser holders to resist a dead load of 200 lbs applied vertically to the outer edge of the diffuser holder. Provide end caps at the end of each air distribution header.
5. Provide complete pipe support system for entire manifold and header assembly, including dropleg connections along reactor wall. Support spacing to be limited to a maximum of 8 feet. Design all supports to allow for thermal expansion and contraction forces over a temperature range of 125° F and to minimize stress build up in the piping system. Design supports shall be adjustable without removing the air distribution header from the support. Design supports shall include hold down guide straps, support structure and two anchor bolts. Design guide straps with a 2-inch minimum width to eliminate point load on manifold and minimize binding. Design support for a total of 4-inch vertical adjustment for leveling of manifold within ¼ inch of a common plane.
6. Provide guide and fixed type supports for air distributors and manifolds to allow expansion/contraction. Design supports to include hold down straps, support structure, locating plate and single anchor bolt. To prevent improper installation, the locating plate shall be able to be installed in either of two directions relative to the support. Design support for a total of 3-inch vertical adjustment for leveling air distribution headers within 1/4-inch of a common plane. Guide straps shall have 1 1/2-inch wide top and bottom contoured bearing surface with chamfered edges to minimize binding and resistance to movement of air distributor under full buoyant uplift load. Design strap with 1/8-inch clearance around distributor so strap is self-limiting and cannot be over tightened.
7. All supports shall be 304 stainless steel construction.

8. Provide diffuser assemblies including diffuser, holder, retaining ring, and air flow control orifice. Incorporate integral check valve into the membrane diffuser.
    a. Test diffuser using primary sampling criteria outlined in Military Standard 105E. Manufacture circular membrane diffuser with integral O-ring of EPDM synthetic rubber compound with precision die formed slits. Add carbon black to the material for resistance to ultraviolet light. Design diffuser as one piece injection molded part with a minimum thickness of 0.080 inches for 9 inch diameter unit. Extractable oil content shall not exceed 10%. Limit the maximum tensile strength of the diffuser to 10 psi when operating at 2.4 SCFM/sq. ft. of material.
    b. Visual Uniformity: Observe diffusers for uniform air distribution across the active surface of the diffuser at 1.0 SCFM/diffuser and 2 inches submergence. Active surface shall be defined as the perforated horizontal projected area of the diffuser. Factory test diffusers for a dynamic wet pressure (DWP) of 12 inches ± 20% water column @ 1.0 SCFM/diffuser and 2 inches submergence.

C. Influent Distribution System:
1. Equipment Supplier shall provide one (1) influent distribution system for each AGS Basin. System shall consist of PVC and HDPE components.
2. Complete support system shall be provided, including anchors. All support components shall be of 304 stainless-steel construction.
3. Influent distribution system shall connect to 36” flange provided by Contractor. Connection shall be internal to the tank and within 48 inches of interior wall as shown in the CONTRACT DRAWINGS.

D. Solids / WLC Waste Assembly:
1. Equipment Supplier shall provide one (1) HDPE withdrawal manifold for each AGS Basin to facilitate removal of sludge and WLC during applicable operational cycles.
2. Complete support system shall be provided, including anchors. All support components shall be of 304 stainless steel construction.
3. Solids / WLC waste assembly shall connect to 24” flange provided by Contractor. Connection shall be internal to the tank and within 24 inches of interior wall as shown in the Contract Drawings.

E. Effluent Weir Assembly:
1. Furnish one (1) effluent weir system for each AGS Basin, consisting of maximum eight (8) finger weirs to be installed between basin exterior concrete walls and center concrete effluent trough.
2. Effluent weirs shall be 304 stainless steel.
3. Complete support system shall be provided, inlcuding anchors. All support compoenents shall be of 304 stainless steel construction.

F. Solids Buffer Tank Sludge Withdrawal Assembly:
1. Furnish one (1) solids withdrawal assembly for each Sludge Buffer Tank.
2. Manifold shall be of PVC and HDPE construction and shall be provided with 10” flanged connection internal to each tank for connection to Contractor piping connection.
3. Supply all required supports and anchors. Supports and anchors shall be 304 stainless steel construction.

G. Tank internals shall be installed by Contractor per Equipment Supplier instructions and guidelines.

2.05 UTILITY CORRIDOR VALVES:

A. Influent Header Control Valves:

1. Equipment Supplier shall provide two (2) electronically actuated 30-inch plug valves for each AGS Basin (total of 8 valves). The valves shall be intended for use in 1 Duty / 1 Standby service.
2. Valve construction shall conform to Section 33 12 16 – Utility Valves and Accessories.
3. Electric motor actuators shall be 460V, 3ph, 60Hz service.
4. Actuators shall include motor winding protection, integral disconnect switch (NEMA 4X), manual override and limit switch feedback to allow monitoring of valve position and whether valve is open or closed.
5. Actuators shall include local controls, including push buttons for opening / closing, selector switches for placing actuator in hand or remote, and indicator lights to identify if valve is open / closed and if the valve is in a fault mode.
6. Open/close electric motor actuator shall include the following control signals, at minimum:
    a. Discrete outputs:
        (1) Dry contacts rated 5A, 120Vac.
        (2) Signals:
            (a) Open limit switch.
            (b) Closed limit switch.
            (c) In-Remote status.
    b. Discrete inputs:
            (a) Open/Close.

B. Sludge and WLC Modulating Control Valves
1. Equipment supplier shall provide two (2) electronically actuated 20-inch plug valves for each AGS Basin (total of 8 valves). The valves shall be intended for modulating service.
2. Equipment Supplier shall provide two (2) electronically actuated 20-inch plug valves to serve the Sludge Buffer Tanks. The valves shall be intended for open / close service.
3. Valve construction shall conform to Section 33 12 16 – Utility Valves and Accessories.
4. Electric motor actuators shall be 460V, 3ph, 60Hz service.
5. Actuators shall include motor winding protection, integral disconnect switch (NEMA 4X), manual override and limit switch feedback to allow monitoring of valve position and whether valve is open or closed.
6. Actuators shall include local controls, including push buttons for opening / closing, selector switches for placing actuator in hand or remote, and indicator lights to identify if valve is open / closed and if the valve is in a fault mode.
7. Modulating electric motor actuators shall include the following control signals, at minimum:
    a. Discrete outputs:
        (1) Dry contacts rated 5A, 120Vac.
        (2) Signals:
            (a) Open limit switch.
            (b) Closed limit switch.
            (c) In-Remote status.
    b. Discrete inputs:
            (a) Open/Close.
    c. Analog output:
        (1) 4-20mA range.
            (a) Position control.
            (b) Position feedback.

2.06 HORIZONTAL END-SUCTION CENTRIFUGAL PUMPS:

A. Equipment supplier shall furnish the following horizontal end-suction centrifugal pumps for sludge, supernatant, and WLC service.

B. All pumps shall be manufactured by Gorman Rupp.

C. Materials of Construction:

1. Construct motor housing, pump casing, and major pump components of cast iron conforming to ASTM A48.
2. Casing:
   a. Designed to withstand a hydrostatic pressure of 150% of the shutoff head.
   b. Single-stage, single-suction, volute type.
   c. Provide flanged hand hole for inspection of casing interior.
   d. Inside face contoured to match volute.
   e. Bolted to casing.
   f. Provide with rigid mounting assembly to support motor weight, assure proper pump and motor alignment, and dampen vibration within the specific tolerance.
   g. Provide flanged suction and discharge flanges to match the connecting pipe flanges.
   h. Provided with casing vent and drain connections
3. Impeller:
   a. Open design with smooth water passages to prevent clogging.
   b. Balanced statically and dynamically to eliminate vibration and minimize hydraulic end thrust.
   c. Castings shall not have been repaired by plugging, welding, or other means.
   d. Securely fitted and keyed or screwed to the shaft
4. Shaft:
   a. Ample diameter to assure first critical speed will occur at not less than 150% of rated pump speed.
   b. Provide shaft with sleeves designed to prevent water leakage between shaft and sleeves. Adequately anchor sleeves to the shaft to prevent rotation relative to shaft.
   c. Completely encase shaft along its entire length within the pump by the impeller and sleeves.
   d. Proportioned to transmit all loads and torque without deflection or twisting.
5. Bearings:
   a. Bearings shall be permanently lubricated.
   b. Inboard bearings shall be roller, while outboard bearings may be ball or roller.
   c. Designed for all radial and thrust loads imposed by hydraulically unbalanced impellers.
   d. Have provisions for shaft and casing expansion movement.
   e. Designed for a minimum L-10 life of 100,000-hour minimum in accordance with ABMA standards.
6. Shaft Seals:
   a. Pump shall have a single self-contained mechanical seal.
7. Drive Coupling:
   a. Provide adequate spacer length to allow removal of end suction pump internals or mechanical seal from horizontal split-case pumps without disturbing casing.
   b. Rigidly fastened to the base plate. Guard shall be arranged to allow ease of disassembly or removal for access to the coupling.
   c. Prevent any thrust from being transmitted to the drive motor shaft under any operating condition.
   d. Rated for at least 150% of drive motor horsepower.

8. Base Plate:
   a. Provide each pumping unit with a separate base plate.
   b. Provide for rigid anchoring of pump, motor, coupling guard including all blocks and leveling plates.
   c. Have a raised drip lip around the perimeter with a threaded drain connection.
   d. Provide all necessary bolting to attach all components to the base plate.
   e. Cast-iron or steel base plates shall be designed rigid enough for no grout, but shall be suitable for field grouting under the entire plate.
9. Motors:
   a. Shall be in accordance with Section 46 05 13 and herein.
   b. All motors shall be of single-speed, premium-efficient, squirrel cage induction design.
   c. All motors shall be rated for 480V, 3-phase, 60-Hz operation with the service factor of 1.15. RPM rating shall be as required.
   d. Designed for operation with variable frequency drive.
   e. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. Switches shall be rated for use with 120Vac.
   f. Provide factory installed, maintenance free, circumferential, conductive micro fiber shaft grounding ring to discharge shaft currents to ground.
   g. Rated horsepower as required at 40° C ambient with Class F insulation.
   h. Comply with the applicable provision of NEMA with a minimum B-10 bearing life of 100,000 hours.
10. Materials:
   a. The materials specified below indicate a standard of quality. Substitutions may be made or recommended by Supplier upon approval of Purchaser, if deemed necessary due to quality of fluid being pumped, start-up system flushing chemical additives, or other reasons.
      (1) Base Plate: ASTM A36 structural steel or ASTM A48 cast iron.
      (2) Casing: Cast iron, cast steel, or ductile iron.
      (3) Impeller: ASTM A395 or ASTM A536 cast-ductile iron.
      (4) Shaft: AISI 1045 carbon steel or ASTM A322 Grade 4140.
      (5) Shaft Sleeve: ASTM A276 Type 416 Condition A.

D. Sludge Pumps:
1. Description of Service: Sludge pumps shall be used to transfer thickened sludge layer from Sludge Buffer Tanks to the Thin Sludge Tanks (provided by Others). Pumps shall be provided with one unit dedicated to each of two (2) Sludge Buffer Tanks, with a third pump available as a standby unit.
2. Number of Units: 3 Pumps (2 Duty / 1 Standby).
3. Design Capacity, each:
   a. Flow: 185 gpm.

E. Total Dynamic Head: 42.3 feet.
1. Maximum Motor Size: 7.5 HP.

F. Supernatant Pumps:
1. Description of Service: Supernatant pumps shall be used to transfer supernatant layer from Sludge Buffer Tanks following withdrawal of the thickened sludge layer. Supernatant shall be pumped to the AGS Influent Header (provided by Others). Pumps shall be provided with one unit dedicated to each of two (2) Sludge Buffer Tanks, with a third pump available as a standby unit.
2. Number of Units: 3 Pumps (2 Duty / 1 Standby).

3. Design Capacity, each:
   a. Flow: 740 gpm.
   b. Total Dynamic Head: 30 feet.
4. Maximum Motor Size: 15 HP.

G. WLC Pumps:
1. Description of Service: WLC pumps shall be used to transfer liquid from the WLC tank. WLC liquid shall be pumped to the AGS Influent Header (provided by Others). Pumps shall be provided in a 1 Duty / 1 Standby configuration.
2. Number of Units: 2 Pumps (1 Duty / 1 Standby).
3. Design Capacity, each:
   a. Flow: 485 gpm.
   b. Total Dynamic Head: 30 feet.
4. Maximum Motor Size: 15 HP.

2.07 ELECTRICAL:

A. Electrical material and equipment shall have UL listing wherever standards have been established by that agency.
B. Complete electrical assembly shall meet all requirements of the National Electrical Code, the National Electrical Manufactures Association (NEMA), the National Fire Protection Association (NFPA), all applicable state and local codes.
C. Three phase, 480V, 60 Hz power will be available for all Treatment System equipment, except instruments.
D. Unless specifically noted otherwise, all the power distribution equipment including the motor control center, variable frequency drives, motor starters and panelboards etc. for the Treatment System equipment shall be provided by Others.

2.08 PROCESS CONTROL PANEL:

A. Provide and program a Programmable Logic Controller (PLC) based system with an operator interface to control the operation of the Treatment System including all ancillary equipment as specified in this section.
B. Programmable Logic Controllers (PLC):
1. Refer to Section 40 67 00 – Process Control Panels and Hardware for all requirements of the AGS control system PLC.
2. Provide Allen-Bradley ControlLogix series PLC hardware as specified and required for application.
3. The PLC shall communicate with the Plant Control System over an EtherNet/IP communications network.
4. The PLC shall each include spare parts as well as memory sufficient to implement all application software plus 100% spare capacity as minimum.
5. The PLC should be capable of communicating and controlling the following treatment processes at the minimum in addition to the Treatment System.
   a. All automatic valves that are associated with the Treatment System.
   b. Aeration Blowers.
   c. Sludge Pumps.
   d. Supernatant Pumps.
   e. WLC Pumps.
   f. Instrumentation, sampling pumps, and sampling panels, as required.

C. PLC I/O:

1. Refer to the I/O List at the end of this Section for a list of I/O required to be provided for the AGS control system.
2. Refer to Section 40 67 00 for requirements of PLC input and output modules for the consumption of all AGS PLC I/O.

D. Main Control Panel (AGS-MCP-001):
1. Provide a Main Control Panel (MCP) to house the PLC and associated control panel components that conform to Section 40 67 00 – Process Control Panels and Hardware.
   a. The MCP shall operate from a 120 VAC, single phase, 60Hz power supply.
   b. MCP shall be NEMA 12 rated cabinet located in a dedicated electrical room in the Blower Building.
   c. Motor and valve controls shall be a combination of hardwired control and network controls via the plant control system connection. The communications shall be by EtherNet/IP protocols. Refer to plans and schematics for specific control cabling and communication requirements.
2. Provide and configure an Operator Interface Terminal (OIT) installed within the door of the Main Control Panel. The OIT shall be as specified in Section 40 67 00 – Process Control Panels and Hardware.
3. Provide and configure a panel mount managed Ethernet switch within the main control panel for connection of the Plant Control System and all applicable AGS equipment. The network switch shall be as specified in Section 40 66 00 Process Control Networks.
4. Spare Parts: In addition to the general spare parts defined by Section 40 70 00, the following shall be provided specifically for the supplied main control panel PLC.
   a. One spare ControlLogix PLC processor as specified in Section 40 67 00.
   b. One spare I/O module of each type used.

E. Process Control
1. Unless otherwise specified, all equipment shall be capable of being controlled at the OIT and local controls including push buttons and pilot devices with the following functionality as minimum:
   a. For each Aeration Blower:
      (1) Manual/Auto.
      (2) Start/Stop.
      (3) Alarm reset.
      (4) Speed adjustment.
   b. For each Pump:
      (1) Manual/Auto.
      (2) Start/Stop.
      (3) Alarm reset.
      (4) Speed adjustment.
   c. For each Motor-Actuated Valve:
      (1) Manual/Auto.
      (2) Open/Close.
      (3) Alarm reset.
      (4) Position adjustment (for modulating valves).
2. The PLC shall be capable of receiving initial run-time values for existing and proposed equipment. Initial run-time shall not automatically be assumed to be zero.
3. Unless otherwise specified, all flows and equipment run-times shall be totalized in the PLC and displayed on the HMI for current day, prior day, weekly, monthly, and annual totals.

F. HMI Screen Development:

1. Refer to Section 40 61 96 - Process Control Software Programming and Reports for requirements of HMI operator screen development.
2. HMI screens shall be developed for control interface and monitoring of AGS systems and related equipment.
3. The AGS System Supplier shall coordinate with the Systems Integrator to establish HMI development standards to ensure the HMI screens developed by the AGS supplier and the System Integrator share the same typical graphics, faceplates, and function blocks to meet the project standards.
4. The AGS System Supplier shall develop and provide a complete set of HMI screens with all system application files to the Systems Integrator. The screens shall be integrated into the Plant Control System HMI screen set.
5. The AGS System Supplier shall provide the necessary coordination with the Systems Integrator to ensure a fully functional application. Refer to Part 3 of this Section for minimum coordination requirements with the Systems Integrator.

2.09 AQUANEREDA SERVER:

A. Provide a Process System Server for monitoring, calculations, and modification of control system parameters.
B. The server shall communicate control system updates to the main control panel PLC over the Ethernet network.
C. The servers shall be rack mount design and provided with sliding rack rails. The server shall be installed in the plant control system network rack (by others). The server shall include the following as minimum.
   1. The processor shall be an Intel® Xeon E2334, 3.4GHz, 8MB Cache or greater.
   2. Provide 132.0 Gigabytes (minimum) of registered UDIMM.
   3. Provide a minimum of two fully rated power supplies for redundant operation.
   4. Provide with dual on-board 10/100/1000 Base-T network interface card. The dual NIC card shall be configurable to serve as a primary and secondary fail-over.
   5. Provide Dell Power Edge R250 Server or approved equal.
D. The graphics card shall be integrated with a minimum of 16 MB of video memory.
E. Disk Drives:
   1. Provide two (2) 1TB SATA Drives, 7200 rpm, 6Gbps, 3.5”.
   2. Provide C22, RAID 1 for S140 SATA.
F. Operating System and Software:
   1. Provide Microsoft Windows Server 2022 with five client access licenses (CAL’s) as necessary. Provide and install the latest service packs and patches available that are compatible with the supplied control software.
   2. The servers shall have a clean install of the operating system and hardware drivers. Non-essential applications, such as manufacturer provided trial software and utilities, shall not be loaded on the system.
   3. Provide Remote Desktop Services (RDS) client access licenses (CAL’s) as required.
   4. Provide one copy of the latest version of Microsoft Office Professional for each server.

2.10 DESCRIPTION OF OPERATIONS:

A. Equipment Supplier shall provide any additional automatic valves and instrumentation as required to provide a complete, functional system. Any additional items shall be coordinated with the Design Engineer and Contractor to be incorporated into this Section and Contract Drawings, including Process & Instrumentation Diagrams.

B. Equipment Supplier shall tag all provided equipment as specified herein, and as shown on the Contract Drawings and Section 40 70 00. Any additional items required by Equipment Supplier shall be coordinated with Design Engineer to develop appropriate tagging.

C. System Components and Functions:
   1. Equipment denoted with "*" symbols is to be provided by the Contractor / System Integrator. Refer to Section 40 61 96 and Section 40 70 00 for additional requirements.
   2. AGS Main Control Panel AGS-MCP-001.
      a. Equipment Supplier provided control panel for control of the Treatment System containing a PLC, operator interface, and other ancillaries necessary for control of the equipment.
   3. AGS Nereda Controller AGS-SVR-001.
      a. Equipment Supplier provided software-based controller running on a host server located in the Blower Building Electrical Room network rack.
   4. AGS Influent Header:
      a. *Influent Header Analytical Transmitter AGS-AIT-001 for the following*:
         (1) *Analytical element AGS-AE-001 for measuring influent total suspended solids*.
   5. AGS Basins:
      a. AGS Basin No. 1:
         (1) Basin No. 1 Influent Valve A AGS-VLV-101:
            (a) Motor actuated valve with open/close service.
         (2) Basin No. 1 Influent Valve B AGS-VLV-103:
            (a) Motor actuated valve with open/close service.
         (3) *Basin No. 1 Influent Flow Meter Transmitter AGS-FIT-101 for monitoring the following*:
            (a) *Basin No. 1 Influent Flow Meter AGS-FE-101*:
               i) Magnetic flow meter for measuring influent flow into the basin.
         (4) Basin No. 1 Thermal Mass Flow Meter AGS-FIT-101:
            (a) Measures process air flow to Basin No. 1.
         (5) Basin No. 1 Aeration Header Air Valve AGS-VLV-105 :
            (a) Motor actuated valve with modulating service.
         (6) Basin No. 1 Air Valve AGS-VLV-108:
            (a) Motor actuated valve with open/close service.
         (7) Basin No. 1 Air Valve AGS-VLV-109:
            (a) Motor actuated valve with open/close service.
         (8) Basin No. 1 Sludge Withdrawal Valve AGS-VLV-110:
            (a) Motor actuated valve with modulating service.
         (9) Basin No. 1 WLC Withdrawal Valve AGS-VLV-111:
            (a) Motor actuated valve with modulating service.
         (10) Basin No. 1 Level Indicating Transmitter AGS-LIT-101:
            (a) Submersible pressure transducers for measuring basin water level.
         (11) Basin No. 1 Analytical Transmitter AGS-AIT-110:
            (a) Transmitter/controller for monitoring the following basin probes:
               i) Analytical element AGS-AE-111 for measuring Ammonium (NH_4^+).
         (12) Basin No. 1 Analytical Transmitter AGS-AIT-120:
            (a) Transmitter/controller for monitoring the following basin probes:
               i) Analytical element AGS-AE-121 for measuring pH/Temperature.

ii) Analytical element AGS-AE-122 for measuring dissolved oxygen (DO).
iii) Analytical element AGS-AE-123 for measuring total suspended solids (TSS).
iv) Analytical element AGS-AE-124 for measuring oxidation-reduction potential (ORP).

b. AGS Basin No. 2:
(1) Basin No. 2 Influent Valve A AGS-VLV-201:
(a) Motor actuated valve with open/close service.
(2) Basin No. 2 Influent Valve B AGS-VLV-203:
(a) Motor actuated valve with open/close service.
(3) *Basin No. 2 Influent Flow Meter Transmitter AGS-FIT-201 for monitoring the following*:
(a) *Basin No. 2 Influent Flow Meter AGS-FE-201*:
i) Magnetic flow meter for measuring influent flow into the basin.
(4) Basin No. 2 Thermal Mass Flow Meter AGS-FIT-201:
(a) Measures process air flow to Basin No. 2.
(5) Basin No. 2 Aeration Header Air Valve AGS-VLV-205:
(a) Motor actuated valve with modulating service.
(6) Basin No. 2 Air Valve AGS-VLV-208:
(a) Motor actuated valve with open/close service.
(7) Basin No. 2 Air Valve AGS-VLV-209:
(a) Motor actuated valve with open/close service.
(8) Basin No. 2 Sludge Withdrawal Valve AGS-VLV-210:
(a) Motor actuated valve with modulating service.
(9) Basin No. 2 WLC Withdrawal Valve AGS-VLV-211:
(a) Motor actuated valve with modulating service.
(10) Basin No. 2 Level Indicating Transmitter AGS-LIT-201:
(a) Submersible pressure transducers for measuring basin water level.
(11) Basin No. 2 Analytical Transmitter AGS-AIT-210:
(a) Transmitter/controller for monitoring the following basin probes:
i) Analytical element AGS-AE-211 for measuring NH_4^+.
(12) Basin No. 2 Analytical Transmitter AGS-AIT-220:
(a) Transmitter/controller for monitoring the following basin probes:
i) Analytical element AGS-AE-221 for measuring pH/Temperature.
ii) Analytical element AGS-AE-222 for measuring DO.
iii) Analytical element AGS-AE-223 for measuring TSS.
iv) Analytical element AGS-AE-224 for measuring ORP.

c. AGS Basin No. 3:
(1) Basin No. 3 Influent Valve A AGS-VLV-301:
(a) Motor actuated valve with open/close service.
(2) Basin No. 3 Influent Valve B AGS-VLV-303:
(a) Motor actuated valve with open/close service.
(3) *Basin No. 3 Influent Flow Meter Transmitter AGS-FIT-301 for monitoring the following*:
(a) *Basin No. 3 Influent Flow Meter AGS-FE-301*:
i) Magnetic flow meter for measuring influent flow into the basin.
(4) Basin No. 3 Thermal Mass Flow Meter AGS-FIT-301:
(a) Measures process air flow to Basin No. 3.

(5) Basin No. 3 Aeration Header Air Valve AGS-VLV-305:
(a) Motor actuated valve with modulating service.
(6) Basin No. 3 Air Valve AGS-VLV-308:
(a) Motor actuated valve with open/close service.
(7) Basin No. 3 Air Valve AGS-VLV-309:
(a) Motor actuated valve with open/close service.
(8) Basin No. 3 Sludge Withdrawal Valve AGS-VLV-310:
(a) Motor actuated valve with modulating service.
(9) Basin No. 3 WLC Withdrawal Valve AGS-VLV-311:
(a) Motor actuated valve with modulating service.
(10) Basin No. 3 Level Indicating Transmitter AGS-LIT-301:
(a) Submersible pressure transducers for measuring basin water level.
(11) Basin No. 3 Analytical Transmitter AGS-AIT-310:
(a) Transmitter/controller for monitoring the following basin probes:
i) Analytical element AGS-AE-311 for measuring NH_4^+.
(12) Basin No. 3 Analytical Transmitter AGS-AIT-320:
(a) Transmitter/controller for monitoring the following basin probes:
i) Analytical element AGS-AE-321 for measuring pH/Temperature.
ii) Analytical element AGS-AE-322 for measuring DO.
iii) Analytical element AGS-AE-323 for measuring TSS.
iv) Analytical element AGS-AE-324 for measuring ORP.

d. AGS Basin No. 4:
(1) Basin No. 4 Influent Valve A AGS-VLV-401:
(a) Motor actuated valve with open/close service.
(2) Basin No. 4 Influent Valve B AGS-VLV-403:
(a) Motor actuated valve with open/close service.
(3) *Basin No. 4 Influent Flow Meter Transmitter AGS-FIT-401 for monitoring the following*:
(a) *Basin No. 4 Influent Flow Meter AGS-FE-401*:
i) Magnetic flow meter for measuring influent flow into the basin
(4) Basin No. 4 Thermal Mass Flow Meter AGS-FIT-401:
(a) Measures process air flow to Basin No. 4.
(5) Basin No. 4 Aeration Header Air Valve AGS-VLV-405 :
(a) Motor actuated valve with modulating service.
(6) Basin No. 4 Air Valve AGS-VLV-408:
(a) Motor actuated valve with open/close service.
(7) Basin No. 4 Air Valve AGS-VLV-409:
(a) Motor actuated valve with open/close service.
(8) Basin No. 4 Sludge Withdrawal Valve AGS-VLV-410:
(a) Motor actuated valve with modulating service.
(9) Basin No. 4 WLC Withdrawal Valve AGS-VLV-411:
(a) Motor actuated valve with modulating service.
(10) Basin No. 4 Level Indicating Transmitter AGS-LIT-401:
(a) Submersible pressure transducers for measuring basin water level.
(11) Basin No. 4 Analytical Transmitter AGS-AIT-410:
(a) Transmitter/controller for monitoring the following basin probes:
i) Analytical element AGS-AE-411 for measuring NH_4^+.
(12) Basin No. 4 Analytical Transmitter AGS-AIT-420:
(a) Transmitter/controller for monitoring the following basin probes:

i) Analytical element AGS-AE-421 for measuring pH/Temperature.
ii) Analytical element AGS-AE-422 for measuring DO.
iii) Analytical element AGS-AE-423 for measuring TSS.
iv) Analytical element AGS-AE-424 for measuring ORP.

e. The AGS Basins receive and treat influent wastewater. The basins include Equipment Supplier provided instrumentation and all required tank internals for a complete functional system.

6. Sludge Buffer Tanks:
   a. Sludge Buffer Tank No. 1:
      (1) Waste Sludge Header Valve AGS-VLV-511
         (a) Motor actuated valve with open/close service.
      (2) Sludge Buffer Tank No. 1 Level Transmitter AGS-LIT-510.
         (a) Submersible pressure transducers for measuring the Sludge Buffer Tank level.
      (3) Sludge Buffer Tank No. 1 Level Switches AGS-LSLL-510, AGS-LSL-510, and AGS-LSH-510.
         (a) Float level switches for tank level alarms and automatic shutoff of the Sludge Pumps and Supernatant Pumps in REMOTE AUTO.
   b. Sludge Buffer Tank No. 2:
      (1) Waste Sludge Header Valve AGS-VLV-521
         (a) Motor actuated valve with open/close service.
      (2) Sludge Buffer Tank No. 1 Level Transmitter AGS-LIT-520.
         (a) Submersible pressure transducers for measuring the Sludge Buffer Tank level.
      (3) Sludge Buffer Tank No. 1 Level Switches AGS-LSLL-520, AGS-LSL-520, and AGS-LSH-520.
         (a) Float level switches for tank level alarms and automatic shutoff of the Sludge Pumps and Supernatant Pumps in REMOTE AUTO.
   c. Sludge is wasted from the AGS Basins to the Sludge Buffer Tanks for gravity thickening and subsequent pumping of sludge and supernatant.
7. Supernatant Pumps:
   a. Supernatant Pump No. 1 AGS-PMP-610:
      (1) Horizontal centrifugal pump controlled by a VFD (by Others).
      (2) Associated with Sludge Buffer Tank No. 1.
   b. Supernatant Pump No. 2 AGS-PMP-620:
      (1) Horizontal centrifugal pump controlled by a VFD (by Others).
      (2) Associated with Sludge Buffer Tank No. 1 or Sludge Buffer Tank No. 2, dependent on position of manual pump valves and Operator selection at the Equipment Supplier HMI.
   c. Supernatant Pump No. 3 AGS-PMP-630:
      (1) Horizontal centrifugal pump controlled by a VFD (by Others).
      (2) Associated with Sludge Buffer Tank No. 2.
   d. *Supernatant Flow Transmitter AGS-FIT-601 for monitoring the following*:
      (1) *Supernatant Flow Meter AGS-FE-701*:
         (a) Magnetic flow meter for measuring supernatant flow from Sludge Buffer Tanks.
   e. Supernatant Pumps transfer supernatant from the Sludge Buffer Tanks to the AGS Influent Header after the sludge layer has been discharged to the Solids Processing Building.

8. Sludge Pumps:
    a. Sludge Pump No. 1 AGS-PMP-710:
        (1) Horizontal centrifugal pump controlled by a VFD (by Others).
        (2) Associated with Sludge Buffer Tank No. 1.
    b. Sludge Pump No. 2 AGS-PMP-720:
        (1) Horizontal centrifugal pump controlled by a VFD (by Others).
        (2) Associated with Sludge Buffer Tank No. 1 or Sludge Buffer Tank No. 2, dependent on position of manual pump valves and Operator selection at the Equipment Supplier HMI.
    c. Sludge Pump No. 3 AGS-PMP-730:
        (1) Horizontal centrifugal pump controlled by a VFD (by Others).
        (2) Associated with Sludge Buffer Tank No. 2.
    d. Sludge discharge header Analytical Transmitter AGS-AIT-701 for monitoring the following probes:
        (1) Sludge discharge header Analytical Element AGS-AE-701 for measuring TSS.
    e. *Sludge Flow Transmitter AGS-FIT-701 for monitoring the following*:
        (1) *Sludge Flow Meter AGS-FE-701*.
            (a) Magnetic flow meter for measuring waste sludge flow from Sludge Buffer Tanks.
    f. Sludge Pumps transfer thickened sludge from the Sludge Buffer Tanks to the Solids Processing Building.
9. Water Level Correction (WLC) Tank:
    a. WLC Tank Level Transmitter AGS-LIT-801.
        (1) Submersible pressure transducers for measuring the WLC Tank level.
    b. WLC Tank Level Switches AGS-LSLL-801, AGS-LSL-801, and AGS-LSH-801.
        (1) Float level switches for tank level alarms and low water cutoff of the WLC Pumps.
    c. WLC is transferred from the AGS Basins to the WLC Tank for reprocessing through the Treatment System.
10. WLC Pumps:
    a. WLC Pump No. 1 AGS-PMP-810:
        (1) Horizontal centrifugal pump controlled by a VFD (by Others).
    b. WLC Pump No. 2 AGS-PMP-820:
        (1) Horizontal centrifugal pump controlled by a VFD (by Others).
    c. *WLC Return Flow Transmitter AGS-FIT-801 for monitoring the following*:
        (1) *WLC Return Flow Meter AGS-FE-801*:
            (a) Magnetic flow meter for measuring WLC return from WLC Tank.
    d. WLC Pumps transfer liquid from the WLC Tank to the AGS Influent Header.
11. Aeration Blowers:
    a. Aeration Blower No. 1 AGS-BLOW-910.
        (1) Rotary lobe blower package controlled by a VFD (by Others).
    b. Aeration Blower No. 2 AGS BLOW-920.
        (1) Rotary lobe blower controlled by a VFD (by Others).
    c. Aeration Blower No. 3 AGS-BLOW-930.
        (1) Rotary lobe blower controlled by a VFD (by Others).
    d. Aeration Blower No. 4 AGS-BLOW-940.
        (1) Rotary lobe blower controlled by a VFD (by Others).
    e. Aeration Blower No. 5 AGS-BLOW-950.

(1) Rotary lobe blower controlled by a VFD (by Others).

f. Aeration Header Pressure Transmitter AGS-PIT-901:

(1) Pressure transmitter used for monitoring common aeration header pressure.

D. Description of Operation:

1. Equipment Supplier shall provide complete control system for integrating all process equipment, instrumentation, and required control sequences for complete operation of the Treatment System. The following descriptions of operation are not intended to be complete. Equipment Supplier shall incorporate functionality described herein and coordinate with Design Engineer on any items that conflict with ability of Equipment Supplier control system to perform properly.

2. AGS Basin Feed System:

a. Equipment Supplier shall develop operating sequences for controlling AGS Basin Influent Valves based on influent conditions and historical treatment performance.

b. When transitioning influent feed to a subsequent AGS Basin, the programming shall not allow the previous AGS Basin Influent Valve to close until the current AGS Basin valve is confirmed. For example, if the control system is transitioning between AGS Basin No. 1 and AGS Basin No. 2, the following sequence shall be considered:

(1) AGS Basin No. 2 Influent Valve A AGS-VLV-201 shall be called to open. Once confirmed open, AGS Basin No. 1 Influent Valve A AGS-VLV-101 shall be called to close.

c. AGS Influent Valve Automatic Rotation

(1) The two (2) AGS Influent Valves associated with each AGS Basin shall be programmed in a Duty and Standby configuration.

(2) The Duty valve shall be automatically opened and closed as needed per the Equipment Supplier's control requirements.

(3) The Duty valve shall operate as the control valve for an adjustable number of hours prior to automatic alternation of the Influent Valves. The timer shall be adjustable by the operator and initially set at 168 hours.

(4) The Influent Valves shall be rotated automatically by the Equipment Supplier control system. Manual rotation of the Influent Valves shall also be available to the plant operator at the Equipment Supplier operator workstation.

(a) When the rotation timer elapses, the control system shall queue the rotation of the valves and perform the transition during the next influent cycle when both valves are in the open position. At the end of that cycle, the previous Standby valve shall transition to the Duty valve and close as required.

(5) The Standby valve shall be maintained open at all times during normal operation.

3. AGS Basin Cycle Times:

a. Equipment Supplier shall develop operating sequence for controlling all cycle times, including fill/draw phase, react phase (including aerated and non-aerated operation, as necessary), and settle / decant phase.

b. Equipment Supplier shall provide operator adjustable setpoints for process inputs, including DO, ORP, pH, TSS or other parameters that are assocaited with automatic control of air flow, cycle time, or settling time.

4. AGS Basin Air Flow Control and Blower Control:

a. Equipment Supplier shall include air flow control process for a common aeration header serving all reactors. Each reactor shall utilize the dedicated modulating Aeration Header Valve to deliver air as needed.
b. Blower Control:
    (1) Equipment Supplier shall provide complete control system for managing air flow to the AGS Basins.
    (2) The Aeration Blowers shall be capable of being controlled at the associated blower VFD or remotely by the Equipment Supplier control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
    (3) Local Control:
        (a) When the blowers are in LOCAL control, starting, stopping, and speed adjustment shall be controlled at the associated VFD.
    (4) Remote Control:
        (a) When the blowers are in REMOTE control, starting, stopping, and speed adjustment shall be controlled from the Equipment Supplier main control panel (AGS-MCP-001) PLC.
        (b) When a run command associated with the blower is communicated to the VFD, the corresponding blower shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
        (c) HMI screens shall be developed to allow the operators to select from the following modes of operation:
        (d) Remote Manual Control Mode:
            i) Starting and stopper of each of the blowers is initiated by the operator at the MCP OIT.
            ii) The operator shall set the speed as a percentage of full speed for each of the VFD controlled blowers.
        (e) Remote Automatic Control Mode:
            i) The control system shall automatically start, stop, and adjust the speed of the blowers based on DO, ORP, pH, ammonium, or other parameters as required by the Equipment Supplier to maintain process performance.
            ii) The blowers shall be configured in a four (4) Duty and one (1) Standby configuration. At Equipment Supplier's discretion, the blowers may be programmed to allow all five (5) blowers to operate simultaneously if recommended for process performance.
            iii) The blowers shall be rotated automatically by the control system. All available blowers shall be assigned a sequential priority. After each blower stop cycle, the stopped blower shall automatically be moved to the last priority assignment, with remaining blowers moving up one priority assignment.

5. AGS Water Level Correction (WLC) and Sludge Withdrawal:
    a. Equipment Supplier shall provide programming to automatically open/close/modulate the WLC and sludge withdrawal automatic valves as needed during the settling phase of the biological process.
    b. Valve percent open setpoints shall be developed by Equipment Supplier during commissioning and startup.
6. Sludge Pump Control:

a. Equipment Supplier shall provide complete control system for managing sludge withdrawal from the Sludge Buffer Tanks. All Sludge Pumps are configured to pump into a shared discharge header. Flow monitoring is available on the shared discharge header only.
b. The sludge pumping system is provided with one (1) common TSS analytical element installed on the common sludge discharge header.
c. The pumps shall be capable of being controlled at the associated pump VFD or remotely by the Equipment Supplier control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
d. Local Control:
    (1) When the pumps are in LOCAL control, starting, stopping, and speed adjustment shall be controlled at the associated VFD.
e. Remote Control:
    (1) When the pumps are in REMOTE control, starting, stopping, and speed adjustment shall be controlled from the Equipment Supplier main control panel (AGS-MCP-001) PLC.
    (2) When a run command associated with the pump is communicated to the VFD, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
    (3) HMI screens shall be developed to allow the operators to select from the following modes of operation:
    (4) Remote Manual Control Mode:
        (a) Starting and stopper of each of the pumps is initiated by the operator at the MCP OIT.
        (b) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.
    (5) Remote Automatic Control Mode:
        (a) The control system shall automatically start, stop, and adjust the speed of the pumps based on tank level, total suspended solids, and/or sludge discharge flow.
        (b) No more than one (1) pump shall be called to run at a time.
        (c) Sludge Pumps shall be shut off if low low level is reached in the associated Sludge Buffer Tank. Sludge Pump No. 2 shall shut off only if the tank it is assigned to reaches low low level.
    (6) Sludge Pump No. 2 (AGS-PMP-720) operation:
        (a) The HMI screen shall allow the operator to select the Sludge Buffer Tank with which the pump is associated. The allowable assignments shall be as previously defined in the System Components and Functions section above.
            i) A warning pop-up shall be programmed to ensure the operator has confirmed the manual valve changes for the selected pump assignment. The pop-up shall read as follows:
                a) "Warning: Pump assignment change requires operator confirmation of manual valve positions for intended usage! Are valve positions correct (YES) (NO)?"
                b) If "YES" is selected the assignment change shall be executed. If "NO" is selected the assignment change shall be ignored and remain unchanged.

(b) When two (2) pumps are assigned to one (1) Sludge Buffer Tank, the following automatical controls shall be additionally applicable to other automatic operations:
i) The two (2) pumps shall be programmed in a Duty and Standby Configuration.
ii) The pumps shall be rotated automatically by the control system or manually by the operator. Selections shall be made available on the OIT for enabling and disabling this function.
a) If automatic rotation is enabled, the pumps shall rotate Duty and Standby assignment ater each pump stop cycle.
b) If automatic rotation is disabled, the pumps shall rotate Duty and Standby assignment manually by the operator.

7. Supernatant Pump Control:
a. Equipment Supplier shall provide complete control system for managing supernatant withdrawal from the Sludge Buffer Tanks. All Supernatant Pumps are configured to pump into a shared discharge header. Flow monitoring is available on the shared discharge header only.
b. The pumps shall be capable of being controlled at the associated pump VFD or remotely by the Equipment Supplier control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
c. Local Control:
(1) When the pumps are in LOCAL control, starting, stopping, and speed adjustment shall be controlled at the associated VFD.
d. Remote Control:
(1) When the pumps are in REMOTE control, starting, stopping, and speed adjustment shall be controlled from the Equipment Supplier main control panel (AGS-MCP-001) PLC.
(2) When a run command associated with the pump is communicated to the VFD, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
(3) HMI screens shall be developed to allow the operators to select from the following modes of operation:
(4) Remote Manual Control Mode:
(a) Starting and stopping of each of the pumps is initiated by the operator at the MCP OIT.
(b) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.
(5) Remote Automatic Control Mode:
(a) The control system shall automatically start, stop, and adjust the speed of the pumps based on tank level, and/or supernatant discharge flow.
(b) No more than one (1) pump shall be called to run at a time.
(c) Supernatant Pumps shall be shut off if low low level is reached in the associated Sludge Buffer Tank. Supernatant Pump No. 2 shall shut off only if the tank it is assigned to reaches low low level.
(6) Supernatant Pump No. 2 (AGS-PMP-620) operation:
(a) The HMI screen shall allow the operator to select the Sludge Buffer Tank with which the pump is associated. The allowable assignments

shall be as previously defined in the System Components and Functions section above.

i) A warning pop-up shall be programmed to ensure the operator has confirmed the manual valve changes for the selected pump assignment. The pop-up shall read as follows:
   a) "Warning: Pump assignment change requires operator confirmation of manual valve positions for intended usage! Are valve positions correct (YES) (NO)?"
   b) If "YES" is selected the assignment change shall be executed. If "NO" is selected the assignment change shall be ignored and remain unchanged.

(b) When two (2) pumps are assigned to one (1) Sludge Buffer Tank, the following automatical controls shall be additionally applicable to other automatic operations:
   i) The two (2) pumps shall be programmed in a Duty and Standby Configuration.
   ii) The pumps shall be rotated autoatically by the control system or manually by the operator. Selections shall be made available on the OIT for enabling and disabling this function.
      a) If automatic rotation is enabled, the pumps shall rotate Duty and Standby assignment ater each pump stop cycle.
      b) If automatic rotation is disabled, the pumps shall rotate Duty and Standby assignment manually by the operator.

8. WLC Pump Control:
   a. Equipment Supplier shall provide complete control system for managing liquid withdrawal from the WLC Tank. All WLC Pumps are configured to pump into a shared discharge header. Flow monitoring is available on the shared discharge header only.
   b. The pumps shall be capable of being controlled at the associated pump VFD or remotely by the Equipment Supplier control system when the LOCAL/OFF/REMOTE switch is in REMOTE.
   c. Level switches associated with the WLC Tank will be incorporated into an external low water cutoff (LWCO) system to shut the WLC Pumps off if the low low level is reached.
   d. Local Control:
      (1) When the pumps are in LOCAL control, starting, stopping, and speed adjustment shall be controlled at the associated VFD.
   e. Remote Control:
      (1) When the pumps are in REMOTE control, starting, stopping, and speed adjustment shall be controlled from the Equipment Supplier main control panel (AGS-MCP-001) PLC.
      (2) When a run command associated with the pump is communicated to the VFD, the corresponding pump shall start and run. When a stop command associated with the pump is communicated to the VFD, the corresponding pump shall stop.
      (3) HMI screens shall be developed to allow the operators to select from the following modes of operation:
      (4) Remote Manual Control Mode:

(a) Starting and stopping of each of the pumps is initiated by the operator at the MCP OIT.
(b) The operator shall set the speed as a percentage of full speed for each of the VFD controlled pumps.

(5) Remote Automatic Control Mode:
(a) The control system shall automatically start, stop, and adjust the speed of the pumps based on tank level, and/or discharge flow.
(b) No more than one (1) pump shall be called to run at a time.
(c) The two (2) pumps shall be programmed in a Duty and Standby configuration.
i) The pumps shall be rotated autoatically by the control system or manually by the operator. Selections shall be made available on the OIT for enabling and disabling this function.
a) If automatic rotation is enabled, the pumps shall rotate Duty and Standby assignment ater each pump stop cycle.
b) If automatic rotation is disabled, the pumps shall rotate Duty and Standby assignment manually by the operator.

E. Setpoints and Ranges:
1. For air flow meters, level transmitters, and all analytical devices, Equipment Supplier shall provide a display of instrument range with measurement on HMI screens.

F. System Upsets and Procedures for Recovery:
1. If an abnormal system condition is detected, the control system shall alarm the operator via the operator workstation. Abnormal system conditions shall be as recommended by the Equipment Supplier and the following as minimum:
a. Analytical instrument measurement is out of normal operating range.
b. High level for each basin.
c. Low level for each basin.
d. Reverse flow.
e. Pump, valve, or blower failure.
2. System in Remote Automatic control mode:
a. If a low level is detected by either sludge buffer or water level correction basin level transmitter while the basin is in service, all associated pumps shall be called to stop pumping. The associated pumps shall be allowed to run when the level rises above the pump run setpoint.
b. If a low-low level is detected by either sludge buffer or water level correction basin level switch while the basin is in service, all associated pumps shall be called to stop pumping. The associated pumps shall be allowed to run if the level switch returns to normal state and the alarm is cleared at the operator workstation.
c. In the event a Duty pump becomes unavailable, fails to start, or drops off-line, the Standby pump in the starting sequence shall be automatically selected to operate as the lead pump.
d. In the event an influent valve fails or becomes unavailable, the available valve shall close and the reactor operation shall stop. The AGS control system shall alarm the operator via the operator workstation. The reactor shall be allowed to resume automatic operation after the operator has acknowledged the following message: “Has the malfunctioning influent valve been manually opened and locked out?” If the operator selects “Yes”, the available valve shall be selected as duty and the reactor processes shall restart. If the operator selects “No”, the reactor shall remain out of operation.

3. Unless otherwise specified, all equipment shall automatically restart after a power failure utilizing adjustable start delay timers in PLC control logic. Unless otherwise specified, all PLC control strategies shall be based upon automatic restart after a power failure and shall return to a normal control mode upon restoration of power. Monitoring of power failure shall be through the plant control system network communications.
    a. If operating prior to the power failure in automatic mode, the Aeration Blowers shall be sequentially restarted by the AGS control system. No more than one blower shall be started simultaneously. Operator adjustable time delays shall be programmed between the enabling of each blower to operate.

2.11 INSTRUMENTATION:

A. All instrumentation shall be as specified in Section 40 70 00. Provide instruments as specified herein and as shown on the AGS Instrument List provided as an Appendix to this Section.
B. All analytical instrumentation shall be manufactured by Hach, unless otherwise specified.
C. Temperature/pH Transmitter:
    1. Function: Continuously, measure, indicate, and transmit water temperature and pH of AGS Basin. Each temperature/pH transmitter shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
    2. Provide one temperature / differential pH transmitter for each AGS Basin. The probe shall use two measuring electrodes to compare the process value to a stable internal reference. The sensor shall have a built-in preamplifier, and include an integral temperature sensor. The pH sensor shall automatically compensate measured values for changes in temperature.
    3. Temperature/pH instrument shall be provided with pole mount assembly and handrail support attachments. Equipment Suppler shall provide complete mounting and support assembly.
D. Dissolved Oxygen Transmitter:
    1. Function: Continuously, measure, indicate, and transmit dissolved oxygen (DO) concentration of AGS Basin. Each DO transmitter shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
    2. DO probe shall be a continuous-reading probe utilizing luminescent sensor technology, and shall provide electrolyte-free operation without requiring sample conditioning.
    3. DO probe shall be provided with pole mount assembly and handrail support attachments. Equipment Suppler shall provide complete mounting and support assembly.
E. Level Transmitters/Switches:
    1. Function: Continuously measure, indicate, and transmit the level of water in each AGS Basin, Sludge Buffer Tank, and WLC Tank.
    2. Provide one (1) submersible pressure transducer for each reactor, sludge buffer basin, and water level correction basin as indicated. The transducers shall provide continuous level monitoring for each location
    3. Provide the transducers and accessories as follows:
        a. Transducer body shall be constructed of stainless steel.
        b. Loop-powered, 4-20mA signal output.
        c. Transducer model shall be Keller Levelrat or Engineer-approved equal.
        d. Provide a local display indicator within a NEMA 4X 304 SST enclosure as a complete and pre-wired assembly.
        e. Provide moisture-excluding bellows supplied loose for installation in the display indicator enclosure. The Contractor shall install the bellows in the enclosure per manufacturer recommendations.

f. All mounting and support materials shall be 304 stainless steel.
g. Equipment Supplier shall provide complete mounting and support assembly per recommendations, unless otherwise indicated. The Contractor shall be responsible for installing the mounting and support assembly per manufacturer recommendations, Specifications, and Contract Drawings.

4. Provide level switches as follows and as indicated:.
   a. One (1) level switch for each reactor.
   b. Three (3) level switches for each sludge buffer basin.
   c. Four (4) level switches for each water level correction basin.
   d. Level switch shall be float-type as specified in Section 40 70 00. Provide with the indicated mounting brackets and weight kits for locations indicated. Suspending float switches from support masts shall not be allowed.

F. Oxidation-Reduction Potential Transmitter:
   1. Function: Continuously measure, indicate, and transmit the ORP of the liquid in the AGS Basins. Each ORP transmitter shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
   2. Provide one ORP probe per AGS Basin.
   3. ORP probe shall use two measuring electrodes to compare the process value to a stable internal reference. The sensor shall have a built-in preamplifier, and include an integral temperature sensor.
   4. ORP probe shall be provided with pole mount assembly and handrail support attachments. Equipment Suppler shall provide complete mounting and support assembly.

G. Ammonium Probe:
   1. Function: Continuously measure, indicate, and transmit the ammonia concentration of the liquid in the AGS Basins. Each nitrate probe shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
   2. Provide one Ammonium Analyzer per basin.
   3. Ammonium probe shall be model HC-200NH, as manufactured by Horiba Process & Environmental.
   4. Ammonium probe shall be provided with pole mount assembly and handrail support. Equipment Supplier shall provide complete mounting and support assembly.

H. Orthophosphate Analyzer
   1. Function: Provide routine measurement, indication, and transmittance of orthophosphate concentration of the liquid in a common AGS effluent location. Each orthophosphate analyzer shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
   2. Provide one Orthophosphate Analyzer to be installed in the UV Disinfection influent channel.
   3. The analyzer shall be an Phosphax sc Orthophosphate Analyzer, as manufactured by Hach. The analyzer shall include an ASA UV-resistant, lockable housing, rated to IP55. It shall feature automatic cleaning and calibration, and adjustable extensive self-diagnostics.
   4. Furnish one (1) Hach Filtrax sampling system to be installed for use with the Phosphax analyzer. The sampling system shall consist of a IP55 rated control unit with 120V power supply, submersible module holder and sample delivery hose. Sample hose shall be heated type that is powered from the control unit enclosure. Unit shall be provided with minimum 20 feet of heated suction tubing and 60 feet of heated discharge tubing.

I. Total Suspended Solids Probe:

1. Function: Provide routine measurement, indication, and transmittance of total suspended solids in each AGS Reactor and the discharge of the sludge pumping system. Each total solids probe shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
2. Provide four (4) immersion-style total solids probes to be installed in AGS Basins No. 1 through No. 4, and one (1) pipe insertion-style total solids probe to be installed on the sludge discharge line.
3. The immersion-stype probes shall be Hach model TSS EX1 sc sensor. The insertion style probe shall be Hach model Solitax sc with wiper.
4. Each immersion-style probe shall be provided with pole mounting kit to be field mounted.
5. Each pipe-insertion-style probe shall be provided with installation armature and isolation valve to allow removal of probe from service. Equipment Supplier shall coordinate installation detail with Contractor.

J. Universal Controller Probe Modules:
1. AGS Basins:
   a. One (1) Hach SC1000 Multi-Parameter Universal Controller Probe Module shall be provided for each AGS Basin. The probe module shall receive input from each Hach instrument sensor provided in each basin.
   b. Each module shall be provided with a Hach SC1000 Display module provided in an IP65 enclosure.
2. Sludge Pumping:
   a. One (1) Hach SC4500 Universal Controller Probe Module shall be provided for use with the Solitax sc inline probe adajcent to the Sludge Pumps.
3. Effluent Sampling:
   a. One (1) Hach SC4500 Universal Controller Probe Module shall be provided for use with the Phosphax analyzer mounted in the UV Disinfection Building.
   b. Provide all required accessories for connection of Phosphax instrument to SC4500 Controller, including power junction box.
4. An analog output (4-20mA) card in the probe module shall provide analytical instrumentation signals to the PLC. Quantity of analog outputs per module shall be as required by the instrument and I/O lists. The probe module shall be provided in IP65 enclosure with corrosion resistant finish. Probe module shall include internal 125 VAC power supply and EEPROM memory back-up.

K. Universal Controller Probe Modules – Horiba:
1. One (1) Horiba HD-200NH transmitter shall be provided for each AGS Reactor Basin. The probe module shall receive input from each Horiba instrument sensor.

L. Air Flow Meter:
1. Function: Continuously measure, indicate, and transmit signals proportional to air flow being supplied to each AGS Basin. Each air flow meter shall be integrated with the Equipment Supplier PLC for monitoring, data recording, and process control.
2. Provide one (1) air flowmeter for each AGS Basin.
3. Air flow meter shall be thermal dispersion type, with 1/2-inch compression fitting fabricated of stainless steel and appropriate for pipe insertion into a 14” SCH STD carbon steel pipe. Equipment Supplier shall coordinate appropriate length of insertion probe with Contractor to ensure flow meter manufacturer requirements are met.
4. Each air flow meter shall be provided with integral transmitter. Refer to Contract Drawings for location of meter and transmitter.

a. Power supply to the transmitter shall be rated for 120Vac, single phase, 60Hz operation.

5. All cable fittings required for a complete installation to the transmitter shall be supplied.
6. Aeration piping design includes 24-feet of unobstructed straight pipe run upstream of flow meter and 12-feet of unobstructed straight pipe run downstream of flow meter. Flow conditioners shall not be used unless approved by Design Engineer.
7. Air flowmeter shall be Model ST51A as fabricated by Fluid Components International.
8. Air flowmeter shall be configured to allow mounting to sidewall of 14-inch aeration pipe.

2.12 SPECIAL TOOLS AND SPARE PARTS:

A. Provide the following spare parts at a minimum:
1. Refer to Section 43 11 13 for blower spare parts requirements.
2. Spare diffuser assemblies totaling a minimum of 3% of installed diffuser count.
3. Minimum ten (10) diffuser grid joint assemblies and couplings.
4. One (1) crimping tool.
5. One set of new and unused special tools required for installation, operation, and maintenance.
6. Provide electric motor actuator manufacturer recommended shelf spare parts to limit downtime following actuator failure.
7. One complete set of reagents/chemicals, calibration sets, and spare parts as specified for individual equipment items or instruments.
8. Provide one (1) spare, fully-programmed, and operation-ready PLC controller such that a malfunctioning controller may be replaced in-place and the AGS system will immediately resume operation.
9. Provide at least one (1) spare for each piece of PLC Equipment provided, including but not limited to:
   a. Power supply.
   b. Communications interface module.
10. Provide spare I/O cards in quantities corresponding to 10% (rounded up) of the total quantity of each type of card provided. At least one (1) spare shall be provided for each type of I/O card.
11. Two spare LED indicating lamps for each type and color used.
12. Two spare indicating light assemblies.
13. Provide ten (10) spare fuses of each type used including those used in power supplies, processor, and I/O cards.
14. Ethernet Switches: Provide one (1) spare of each type of switch used.

B. Provide a list of critical recommended and maintenance parts with pricing.
C. Provide prices for all replaceable parts associated with the Treatment System.
D. Guarantee availability of appropriate spare parts as listed above for a period no less than 20 years. If the company or product line no longer exists, the Supplier shall make provisions such that the Treatment System shall continue to operate at the spcified conditions using comparable equipment or products.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. The installing Contractor shall install the Treatment System in strict accordance with Equipment Supplier's instructions and recommendations. Equipment Supplier shall provide written instructions with their submittal on installation requirements.
B. The Equipment Supplier shall provide to the Purchaser a listing of Goods that require protection. Special storage, protection, and handling instructions shall be provided.
C. The Equipment Supplier shall supply all necessary control system addresses, control logic, and OIT screens in order for the Owner's System Integrator to program the plant control system operator screens, database, trends, reports, and alarms, as applicable.
D. Equipment Supplier shall provide a Certificate of Proper Installation to the Owner following installation to certify that the system (inclusive of all equipment specified herein) has been installed correctly.
E. Equipment Supplier shall coordinate exchange of information to the Owner's System Integrator to allow for integration of Treatment System into client SCADA system.

3.02 COMMISSIONING:

A. Refer to SECTION 01757 for additional commissioning requirements.
B. Once written Certification of Proper Installation has been issued, the Equipment Supplier shall coordinate with the Purchaser to perform functional testing of the Treatment System. It will be the responsibility of the Equipment Supplier to coordinate with the Contractor and Owner to arrange the times for testing and startup activities.
C. The Equipment Supplier shall check all valves, controls, and other devices to ensure they are functional and ready for performance testing.
D. The Equipment Supplier shall field calibrate all instruments and be responsible for integration with the Equipment Supplier software programming.
E. Commissioning shall not be considered complete until influent wastewater has been processed through the Treatment System and all equipment and instrumentation has been verified to be working properly.
F. The Equipment Supplier shall complete all commissoning to the satisfaction of the Contractor and Owner prior to commencing the Performance Test.
G. The purpose of commissioning shall be to demonstrate the effectiveness of the following AGS system components and features:
    1. Automatic flow control of the Treatment System, including proper transition between AGS Basins.
    2. Start and stop of air system, and modulation of air flow control valves to maintain operational parameters.
    3. Monitoring of operating data as allowed by Owner.
    4. All control functions.
    5. Operation of all monitoring instruments.
    6. Operation of all associated pumping systems for the sludge blend tank and water level correction tank.

3.03 PERFORMANCE TEST:

A. Following completion of commissioning, the installing Contractor shall conduct the Performance Test (PT) with supervision assistance provided by the Equipment Supplier.
B. Successful completion of the PT shall constitute Initial Acceptance and commence warranty.

C. The Equipment Supplier shall provide the IPT Report within 7 days of completion of the test period.
D. To perform the test, the Equipment Supplier shall assist with operation of the system continuously over a sixty (60) calendar day test period, and collect and summarize data to demonstrate that the system meets the performance test requirements as specified in the warranty.
E. Water quality sampling shall be completed by the Contractor for the PT period.
F. In all cases, compliance with the requirements of this specification shall be determined for each calendar day, and to successfully pass the test, the Treatment System must comply with the requirements for each of the 60 calendar days of the PT.
G. Successful completion of the PT shall be defined as 60 continuous calendar days of operation without a major failure in the system and demonstration that the Treatment System meets all performance requirements established herein. A major failure in the system is one that interrupts system operation for more than 1 hour.
H. If the Treatment System fails to successfully complete the PT, the Equipment Supplier shall have the option of repeating the test over a second 60-day period. All water quality testing during a second, or subsequent PT period shall be the responsibility of the Equipment Supplier. If the system fails to successfully complete the PT during the second test period, the Equipment Supplier shall prepare a written plan for modifying or supplementing the system to meet all test requirements. The Equipment Supplier shall submit the written plan within 7 calendar days after the second unsuccessful test period ends.
I. During the PT, the Owner shall have the option of collecting samples for independent analyses to confirm measurements and analyses conducted by the Equipment Supplier. The Contractor and Owner shall have the option of witnessing all testing performed by the Equipment Supplier. The Equipment Supplier shall notify the Contractor a minimum of two weeks in advance of testing.

3.04 MONITORED TEST PERIOD (MTP):

A. Compliance with the requirements for treatment capacity, and Treatment system effluent water quality use shall be determined during the Monitored Test Period (MTP).
B. The MTP shall begin immediately after successful completion of the PT.
C. Duration shall be 180 calendar days.
D. The Owner shall operate the plant during the MTP; however, the Equipment Supplier shall be allowed to provide onsite or remote assistance.
E. The Equipment Supplier is responsible for monitoring the operating conditions and performance during the MTP. The Owner shall be responsible for providing the Equipment Supplier access to plant data under agreed upon authorized window times. Additionally, the Owner shall be responsible for providing water quality testing data and transfer of logged process data to the Equipment Supplier.
F. The Equipment Supplier shall summarize the data at the end of the MTP and report the results in writing to the Contractor and Owner. The report shall include a narrative description, tables and graphs of influent and effluent water quality parameters, air flow, and flow rates for all monitored liquid streams to document the performance of the system. The Equipment Supplier shall submit the report within 30 days following the end of the MTP.
G. The Treatment System shall exhibit development of granulation by the end of the MTP. To be considered a granular sludge, ninety (90) percent of the sludge shall have a particle size greater than 200 um.

H. The Contractor and Owner may conduct their own monitoring and record-keeping during the MTP. Any monitoring and record-keeping data shall be provided to the Equipment Supplier if requested.

I. The following parameters shall be evaluated during the MTP to determine compliance with the Equipment Suppliers stated performance in the Bidding Documents and submittals. Penalties that shall be owed to the Owner by the Equipment Supplier are as described below.

1. Effluent Water Quality and Treatment Capacity: If the system fails to comply with the requirements for effluent water quality and treatment capacity as shown in Section 2.02 Biological System Design Criteria, the Equipment Supplier shall provide to the Purchaser a written plan of modifications to the Treatment System (such as repairing damaged components, replacing seals, complete replacement of components, etc.) to achieve compliance with the requirements. Upon implementation of the plan of modifications, the MTP shall recommence in its entirety.

3.05 ONSITE SERVICES:

A. The Equipment Supplier shall furnish qualified field personnel to observe and guide the installation, testing and placement of the Treatment System into successful operation. Trips in excess of those described below, which are required for placement of the Treatment System into successful operation shall be at Equipment Supplier's sole expense. The field personnel shall demonstrate experience with installation, start-up, and operation of Treatment Systems of comparable size, application, and complexity.

B. Equipment Supplier's Representative: In addition to the time necessary to complete the requirements established elsewhere within these Specifications, the Equipment Supplier's Representative shall also provide onsite services at times designated by the Owner, for the minimum person-days listed below. Equipment Supplier shall account for travel time outside of these days in their Proposal. The Equipment Supplier's Representative shall be a qualified individual who has previously provided onsite services for the installation, testing, and startup of identical unit processes at a minimum of one wastewater treatment plant of similar size.

1. Electrical/I&C
   a. 4 trips, 16 days. Includes 1 float trip.
   b. Approx. 3.5 days per reactor, 1 day for SB/WLC
   c. Includes:
      (1) Electrical/I&C checkout – aeration system, valves, instrumentation
   d. Electrical/I&C checkout – controller/PLC installation, wiring, phase checks
   e. Manufacture Standard SAT – Site Acceptance Testing – controller and PLC final checkout
2. Mechanical
   a. 4 trips, 16 days. Includes 1 float trip.
   b. Approx. 3.5 days per reactor, 1 day for SB/WLC
   c. Includes:
      (1) Mechanical checkout, dry – basin internal piping, aeration system, valves
      (2) Mechanical checkout – instrumentation
      (3) Mechanical checkout – clean water submerged
3. Process
   a. 4 trips, 16 days. Includes 1 float trip.
   b. Approx. 3.5 days per reactor, 1 day for SB/WLC
      (1) Includes:
      (2) Process startup, checkout
      (3) Process training, sampling, classroom & field instruction

(4) Seeding – oversight, process optimization

3.06 COORDINATION WITH THE SYSTEM INTEGRATOR:

1. The HMI screens associated with the AGS system shall be developed by the AGS System supplier.
2. The AGS System supplier shall coordinate with the System Integrator to establish HMI development standards to ensure the HMI screens developed by the AGS supplier and the System Integrator share the same typical graphics, faceplates, and function blocks to meet the project standards.
3. The System Integrator and AGS supplier shall work together to ensure required control and monitoring signals are communicated correctly between the AGS PLC and the plant PLCs.
4. The AGS system "AquaNereda Controller" shall be supplied by the AGS System Supplier in the form of a rack mounted host server. The server shall be installed and connected to the network by the SI. The AGS supplier shall be responsible for programming and configuration of the server. Coordination shall be provided for this work as required.
5. The System Integrator shall work with the AGS system supplier to establish communication with the aeration drive VFDs.
6. As a minimum the AGS system supplier and System Integrator shall participate in three web conferences setup by the System Integrator and attended by the Engineer to determine programming standards, verify proper application of the standards and coordinate communicated signals.
    a. The first web conference shall occur a minimum of one month prior to the System Integrator or AGS system supplier starting system development and shall serve to discuss development standards and develop an action item list for information needed to properly develop the systems.
    b. The second web conference shall occur one week prior to the AGS system supplier starting system development and shall serve as the meeting to communicate development standards to all parties.
    c. The third web conference shall occur after the oxidation system supplier has completed their initial screen development and PLC program and shall serve as a review meeting to verify that proper standards have been followed and proper points are being communicated.
    d. Follow up conferences shall occur as required during development and after initial development is completed to ensure the agreed to standards are being followed, discuss progress, verify communicated points and address any outstanding communication questions.

3.07 TREATMENT SYSTEM TRAINING:

A. Refer to SECTION 01664 for additional training requirements.
B. Training for the AGS system will take place at Aqua-Aerobic Systems, Inc. (AASI) in Loves Park, IL.
C. On-site training will take place at the Four Rivers Sanitation Authority (FRSA) in Rockford, IL.
D. Training sessions at AASI and FRSA will not conform to the format and content requirements specified in SECTION 01664 and must be approved by the Owner.
E. The Equipment Supplier shall furnish the services of qualified field personnel for 10 person-days to formally instruct the Owner's personnel on proper operation, installation, sampling,

cleaning, maintenance, and troubleshooting for the Treatment System. Time spent with the Owner's personnel during the functional testing and PT does not count toward the training requirements. The training provided by the Equipment Supplier shall be recorded by the Contractor (provide 2 DVD copies and 2 thumb drives containing video files) for further use by the Owner. Equipment Supplier shall cover the following topics at a minimum:

1. Process Overview
    a. Provide introductory training on Treatment System including:
        (1) Definitions.
        (2) Advantages.
        (3) Limitations.
        (4) Required pretreatment.
    b. Discuss the performance criteria, including treatment capacity, and water quality.
    c. Provide a detailed overview of the entire process and the purpose of each process component.
    d. Describe independent processes in detail.
2. Equipment and System Controls:
    a. OIT:
        (1) Provide training on the features and use of each OIT.
        (2) Summarize and demonstrate features provided on each control screen.
    b. Integration with plant controls:
        (1) Discuss fail-safe features, alarms, and integration of the Treatment System with other process equipment.
        (2) Discuss integration with the remainder of plant controls. The Purchaser can assist with this portion of the training.
    c. Local control:
        (1) Demonstrate/discuss use of local controls for each component.
    d. Instrumentation maintenance/calibration:
        (1) Provide "hands-on" training and discuss maintenance requirements as defined in the O&M manual for each unique instrument provided as part of this Procurement Agreement Document.
        (2) Demonstrate calibration of each type of instrument.
        (3) Review/identify documentation provided in O&M manuals
3. Operation:
    a. System Startup/Shutdown Procedures:
        (1) Discuss startup of the Treatment System and level of automation.
        (2) Provide detailed procedures for inspection during and after startup.
        (3) Discuss appropriate shutdown procedures.
        (4) Discuss automated shutdown procedures.
    b. Normal operation:
        (1) Provide detailed sample control screens demonstrating 'normal operation', and displaying the position of each valve during normal operation.
        (2) Discuss operational activities that must be conducted during normal operation to ensure proper operation of the system.
    c. Manual operation:
        (1) Describe/demonstrate operation of any components equipped with manual features.
    d. Typical Treatment Cycle:
        (1) Describe purpose of each treatment cycle.
        (2) Discuss process variables and monitoring aspects of each cycle.

(3) Conduct field observation of all system transitions.

4. Monitoring/Troubleshooting:
   a. Describe methods of troubleshooting process equipment.
   b. Discuss parameters considered critical when troubleshooting problems.
5. Inspection Procedures/Maintenance:
   a. Review inspection procedures for critical components
   b. Review routine maintenance requirements for the entire Treatment System and ancillary components.
6. Proper record keeping:
   a. Discuss the importance of record keeping.
   b. Discuss critical parameters to be monitored and recorded.
   c. Provide sample forms.
7. Interpretation of data relative to operation:
   a. Discuss methods for interpreting data and identifying operational problems based on recorded data. This shall include (but not be limited to) changes in the following parameters:
      (1) Sludge granule size.
      (2) Effluent total solids.
8. Discuss any deficiencies identified during PT.
9. Provide contact information (including the toll-free number) where Owner's personnel can obtain assistance with operation/maintenance issues that may arise.

3.08 LONG-TERM OPERATIONS ASSISTANCE:

A. Equipment Supplier shall provide monitoring and remote operations support for a period of one (1) year after successful commissioning of the Treatment System, at no cost to the Owner.

END OF SECTION 46 53 60

SECTION 46 66 00 – ULTRAVIOLET LIGHT DISINFECTION EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section includes the supply, delivery, installation, and commissioning of the inclined, open-channel low-pressure/low-intensity Ultraviolet (UV) Disinfection System as specified herein. Contractor shall supply all equipment, materials, and labor required for the installation and operation of the UV Disinfection System. Systems utilizing horizontal or vertical lamp configurations are unacceptable.

B. Related Work Specified Elsewhere.
   1. General Requirements: Division 1.
   2. Protective Coatings: Section 09 90 00.
   3. Process Control Panels and Hardware: Section 40 67 00.
   4. Electrical: Division 26.

1.02 REFERENCES:

   7. Underwriters Laboratories Inc. (UL).

1.03 SUBMITTALS:

A. Submit in accordance with Division 1.

B. Technical Submittal includes, but not limited to, the following:
   1. All submittal data shall be labeled in English units. All Drawings shall be drawn to scale, and text shall be in English.
   2. Submit drawings for the UV Disinfection System equipment and accessory equipment including principal dimensions and locations of fittings, electrical connections, electrical equipment, control panels, and remote monitoring equipment.
   3. Technical description of equipment.
   4. Plan and section drawings of proposed system with projected headloss at all specified flows. Headloss shall be represented based on a fixed weir level control. The resulting water level elevations at the fixed weir, downstream of the last UV bank, and upstream of first UV bank shall be clearly shown.
   5. Hydraulic calculations demonstrating compliance with the required hydraulic characteristics.
   6. All structural loads imparted onto the structure.
   7. Anchor bolt design calculations sealed by a Professional Engineer licensed in the state of Missouri.

8. Recommended spare parts list including guaranteed unit costs for five (5) years. The unit costs shall be the same for each year.
9. Material Safety Data Sheet (MSDS) for cleaning chemicals.
10. Submit calculations and Certified Testing Laboratory results indicating the UV Disinfection System can provide the design UV dose at the maximum design flow rate, specified lamp age, and specified UV lamp output. The bioassay shall be signed and sealed by a Missouri licensed Professional Engineer with relevant experience. Calculation package shall include, but not be limited to:
    a. Bioassay report summary
    b. Bioassay validated design UV dose
    c. Reactor retention time
    d. End of lamp life factor, including supporting documentation
    e. Quartz sleeve fouling factor, including supporting documentation
11. Certification of the UV-C output at 254 nm for the proposed lamp. The certification shall be performed by an independent testing laboratory and also certified by the lamp manufacturer. The certification shall include a graph indicating lamp output from 0 to 12,000 hours of operation.
12. Control schematics and wiring diagrams for power, control, and instrumentation that clearly indicate factory and field wiring requirements. All field wiring shall terminate on terminal blocks clearly marked with identification matching control schematics.
13. System control center, power distribution centers, and ballast enclosure elevation drawings showing construction and placement of operator interface devices and other elements.
14. Electric power requirements, wiring diagrams, schematics and datasheets for all electrical equipment and devices.
15. Panel layout including dimensions, bill of materials, and catalog data sheets. Provide power and control wiring diagrams and schematics to clearly show factor and field wiring.
16. Touch screen layouts (for each screen) subject to Engineer approval.
17. Control wiring diagram showing wiring into and out of the control panel and terminal landing points.
18. Functional description of internal and external instrumentation and controls to be supplied including list of parameters monitored, controlled, and alarmed.
19. Submit certification that proposed UV disinfection system will meet the specified *E. Coli* limits and UV dosage requirement(s).

C. Quality Assurance Submittal includes, but not limited to, the following:
1. Submit contact names, addresses, and telephone numbers of at least five (5) similar municipal wastewater installations having a capacity of 12.3 MGD or greater and that have been in operation for at least two (2) years. The systems shall be the same as those specified in Paragraph 2.02.A.
2. Submit maximum electrical demand (kW) for the proposed system at all current conditions and design conditions for 65% UVT, appropriate end of lamp life factor, and appropriate quartz sleeve transparency reduction factor. The appropriate end of lamp life factor and appropriate quartz sleeve transparency reduction factor in accordance with this specification.
3. Performance/disinfection guarantee including terms and conditions of the guarantee (see Article 1.06).
4. A statement indicating the Manufacturers understanding of the bonding and warranty requirements (see Article 1.06).

D. Operation and Maintenance Manual includes, but not limited to, the following:

1. Special shipping, storage, protection, and handling instructions including dimensions of each container or package shipped.
2. Recommended unloading method at project site including implement (e.g., forklift, etc.) and maximum container or package weight.
3. Manufacturer's printed installation instructions.

E. Certifications
1. Field performance test procedures.
2. Submit complete, signed report of results of field inspection, operation, adjustments, and tests. Include the Manufacturer's certificate that the equipment is ready for permanent operation and that nothing in installation will affect Manufacturer's warranty in any manner or render warranty null and void.

1.04 DELIVERY, STORAGE, AND HANDLING MATERIALS:

A. Equipment shall be shipped pre-assembled to the degree that is practicable.
B. Manufacturer shall provide storage instructions indicating specific requirements to ensure there is no damage to or deterioration of components.

1.05 QUALITY ASSURANCE:

A. All items of equipment specified herein shall be furnished by one Manufacturer. This Manufacturer shall have the responsibility of providing the equipment, accessories, installation supervision, and testing services required to provide a functioning system.
B. Like items of equipment provided hereunder shall be the end products of one Manufacturer to achieve standardization for appearance, operation, maintenance, spare parts, and Manufacturer's service.
C. Products used in the Work of this Section shall be produced by the Manufacturer regularly engaged in the manufacture of inclined, open-channel, UV light disinfection systems for municipal wastewater of at least 12.3 MGD for a minimum of five (5) years and with a history of successful installations.

1.06 WARRANTY AND PERFORMANCE/DISINFECTION GUARANTEE:

A. Warranty:
1. The lamps shall have a 100% replacement term (including materials and shipping) of 8,760 operational hours. This warranty is required regardless of whether it is the manufacturer's standard.
2. The manufacturer shall warrant that all Equipment shall be free of defects caused by faulty material or workmanship and shall replace those parts for at least a period of one (1) year from the date of start-up.
3. In the event that the equipment fails to perform as specified, the manufacturer shall promptly repair or replace the defective equipment at no additional cost to the Owner.
4. Multiple warranties for individual components not shall not be acceptable, unless specified otherwise.

B. Performance/Disinfection Guarantee:
1. The Manufacturer shall guarantee that the proposed UV disinfection system will produce an effluent that meets or exceeds the requirements of this specification regardless of the *E. Coli* concentration entering the disinfection process. The effluent quality exiting the UV system must be equal to or better than the specification requirements. The guarantee shall be applicable for a duration of twenty (20) years from the date of startup as long as the wastewater flow and quality remain in the range(s) specified in Paragraph 2.03.

2. In the event that the equipment is not meeting the guaranteed performance requirements specified, alter the equipment to meet the guaranteed performance requirements. All costs associated with modifications shall be done by the Manufacturer. Upon modifying the equipment, the performance verification tests must be repeated. All costs associated with the retesting, including Engineer's cost, shall be borne by the Manufacturer.
3. If the equipment has not demonstrated compliance with performance requirements stated herein within 150 days following start-up of the equipment, the manufacturer shall replace all equipment and ancillary devices specified with the affected equipment (including costs for demolition, removal, and installation of new equipment). Replaced equipment will be returned to, and be the property of the manufacturer. All costs associated with the modifications will be the responsibility of the manufacturer.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS:

A. The following Manufacturers are acceptable and the minimum equipment requirements that are allowed to meet the specified performance include:
   1. Trojan Technologies, Inc., UVSigna.
   2. Wedeco, Duron.
   3. Engineer-approved equal.

B. Since the Manufacturer is ultimately responsible for meeting the specified performance requirements, if based on historic performance and testing, the Manufacturer requires additional equipment than the minimum specified to meet the performance requirements, then the Manufacturer shall be required to propose and bid such additional equipment. In no case shall the Manufacturer propose and bid less than the minimum equipment specified.

C. By listing a specific Manufacturer, the Owner and Engineer do not unconditionally accept that the minimum equipment specified is capable of achieving the performance requirements specified. The Manufacturer is responsible for bidding, supplying, and demonstrating the equipment required to meet the performance requirements.

2.02 GENERAL REQUIREMENTS

A. The UV Disinfection System shall inactivate E. coli in the treatment plant effluent by irradiation with UV light.

B. The UV Disinfection System shall include all equipment shown on the Contract Drawings and as specified herein. The system shall include, but not be limited to, the following equipment:
   1. UV germicidal lamps and electronic ballasts.
   2. UV transmitting sleeves.
   3. UV lamp enclosures (banks or modules).
   4. UV intensity monitor(s).
   5. Low level probe(s).
   6. Power distribution enclosure(s).
   7. UV Disinfection System control center(s).
   8. On-line UVT analyzer.
   9. Lifting Device (if required).
   10. All items necessary for complete assembly.
   11. All appurtenances and safety devices required for proper operation.
   12. Spare parts as required for the complete installation and operation of the system.

2.03 DESIGN REQUIREMENTS (EFF-UV -1, EFF-UV-2, EFF-UV-3, EFF-UV-4):

A. Each channel (Channel 1 = EFF-UV-1, EFF-UV-2) (Channel 2 = EFF-UV-3, EFF-UV-4) shall be sized for the following Design Flow Conditions:
   1. Design Flow Conditions:
      a. Average Daily Flow: 4.6 MGD (with two total banks in service).
      b. Maximum Month Flow: 8.0 MGD (with two total banks in service).
      c. Peak Hourly Flow: 12.3 MGD (with four total banks in service).
      d. Future Peak Hourly Flow: 30.0 MGD (with two channels in service, no redundant banks).

B. Design Water Quality:
   1. Total Suspended Solids: ≤30 mg/L.
   2. BOD_5: ≤30 mg/L.
   3. UVT @ 254 nm: ≥65%.
   4. Effluent Temperature Range: 40 to 80ºF.

C. Design Effluent Quality:
   1. Active *E.Coli*:
      a. < 1,030 / 100 mL (Weekly Geometric Average: October – April)
      b. < 206 / 100 mL (Monthly Geometric Average: April – October)

D. Minimum Equipment Requirements:
   1. Number of Channels: 2
   2. Number of Banks per Channel: 2

E. Water Level Control:
   1. Type: suppressed (finger) weir to be provided by UV system Manufacturer.

F. Design Approach:
   1. The delivered UV dose of the system shall be >30 mJ/cm^2 as measured in the effluent with a maximum UV transmission of 65%.
   2. An independent, third-party bioassay shall be used to verify that for the design UVT and peak flow per lamp, the UV system will deliver the target dosage.
      a. The Manufacturer shall submit supporting independent third-party documentation consistent with one of the following protocols:
         (1) National Water Research Institute's Ultraviolet Disinfection Guidelines for Drinking Water and Water Reuse (May 2003)
         (2) NSF International, the Public Health and Safety Company, 40CFR35.6450 Environmental Technology Verification Protocol
         (3) USEPA Design Manual: Municipal Wastewater Disinfection, EPA/625/1-86/021 (1986).
         (4) USEPA Ultraviolet Disinfection Guidance Manual for the Final Long Term 2 Enhanced Surface Water Treatment Rule, 815-R-06-007.
      b. Design end of lamp life factors and quartz sleeve fouling factors shall be verified by an independent, third testing organization using current protocols issued or approved by the National Water Research institute.
   3. The headloss through the channels with all restrictions factored shall be equal to or less than 0.5 feet at 12.3 MGD. The headloss includes channel baffles, UV banks or modules (including lamps and framework), any other equipment or restrictions, which may be required. The headloss does not include the water level variation associated with the water level control device (i.e., weir).

2.04 MATERIALS:

A. All metal components in contact with the effluent shall be Type 304 or 316 stainless steel.
B. All wiring exposed to UV light shall be Teflon or Polyurethane coated.

C. All material exposed to UV light shall be Type 316 stainless steel, Type 214 quartz, Teflon, Polyurethane, or Viton.

2.05 UV LAMPS:

A. Lamps shall be low-pressure mercury amalgam donated, low intensity type.
B. Low pressure-low intensity UV lamps and systems with no variation capability of the UV energy shall not be permitted.
C. Skin temperature of the UV lamp shall not exceed 130° C.
D. The filament shall be clamped design, significantly rugged to withstand shock and vibration.
E. Lamp life shall be guaranteed for a minimum of 8,760 hours at full power.
F. Electrical connection shall be at one end through a PTFE connector.
G. Lamp bases shall be of a metal and ceramic construction resistant to UV and ozone.
H. Maximum allowable lamp output after 100-hour burn in period (subject to certification by independent testing laboratory):
    1. 1000 watts.
    2. Lamp output shall be average maximum and not peak maximum.
    3. Lamp output shall not fluctuate more than 3% due to water temperature variations between 40-80ºF.

2.06 LAMP SLEEVES:

A. Lamp sleeves shall be Type 214 clear fused quartz circular tubing as manufactured by General Electric or equal.
B. Lamp sleeves shall be rated for a minimum UV transmission of 90 percent and shall not be subject to solarization over the useful life.

2.07 LAMP END SEAL AND LAMP HOLDER:

A. The open end of the lamp sleeve shall be sealed by means of a protective retainer cup designed with dual O-rings to seal and hold the sleeves in parallel alignment. The retainers shall remain in place to protect the quartz sleeve ends against accidental damage without impeding the removal and replacement of the UV lamps.
B. The lamp socket shall be centered against the inside of the quartz sleeve and shall be retained by a cap nut with a ribbed surface providing a positive handgrip for tightening/loosening without the need for any tools. The lamp and socket assembly shall be sealed independently from the quartz sleeve.
C. The lamp mounting and lamp connectors shall permit individual connection or removal under all of the following conditions.
    1. Lamp cable only, with UV lamp and quartz sleeve remaining in place.
    2. Lamp cable and UV lamp with quartz sleeve remaining in place.
    3. Lamp cable, UV lamp, and quartz sleeve.

2.08 LAMP ARRAY CONFIGURATION:

A. The lamp array configuration will be in a staggered inclined arrangement.
B. The single array pattern shall be continuous and symmetrical throughout the reactor.
C. The system shall be designed for complete immersion of the UV lamps including both electrodes and the full length of the lamp tube in the effluent. Both lamp electrodes shall operate at the same temperature and be cooled by the effluent.
D. To maximize performance and ensure safety, bank light locks will be used in each bank to prevent potential short circuiting over the top of the lamps.

E. For any UV inclined system that does not contain UV bank mechanical features to prevent short circuiting, the system shall be supplied with one additional UV bank to compensate for short-circuiting over the top of the lamps.

2.09 ULRAVIOLET LAMP MODULES OR BANKS:

A. Each UV bank shall consist of rows of UV lamps integrated into a 316 stainless steel frame with 316 stainless steel cover shields over the UV radiation area.
B. Each lamp shall be enclosed in its individual quartz sleeve, with the lamp end sealed by O-rings.
C. The ends of the lamp sleeve shall not protrude beyond the stainless-steel frame of the UV bank.
D. The UV bank or module shall be connected to the power distribution center by means of a multi-conductor cable with modular repairable quick disconnect for ease of removal.
E. Each UV bank or module shall be equipped with an automatic wiping and cleaning system. Cleaning shall take place while the bank or module remains in service.
F. The UV banks or modules shall be designed such that operating personnel at the plant can change the lamps and quartz sleeves without requiring special tools.
G. All lamp to ballast cables shall be provided by the UV manufacturer. All terminations shall be coordinated with the Contractor.

2.10 CLEANING SYSTEM:

A. An automatic wiping system shall be furnished. Wiping frequency shall have an adjustable number of strokes and an adjustable timer interval. Cleaning cycles shall be able to be initiated both automatically and manually. The wiping system shall be PLC controlled and fully automatic unattended operation. The cleaning system shall maintain uniform wiping tension and cleaning over complete wiping length of the quartz sleeve. The manufacturer shall guarantee performance of the cleaning system.
B. The wiped length of the quartz sleeve shall be no less than the complete arc length of the lamp.
C. The wiper blade brush or other cleaning device in contact with the quartz sleeve shall be non-metallic and shall not damage or scratch the quartz sleeve in any way.
D. All equipment necessary to power the mechanical wipers shall be provided by the manufacturer (i.e., hydraulic pumps, air compressors, air receivers, controls, etc.). This equipment shall include a NEMA 4X enclosure or be installed in the manufacturer-provided climate-controlled enclosure, and all air or hydraulic lines necessary to connect to the cleaning system. The maximum distance of the equipment from the cleaning system shall be 50 feet.
E. The automatic wiping system shall be equipped with a chemical feed system as designed by Manufacturer for cleaning if required.

2.11 WATER LEVEL CONTROL:

A. The Manufacturer will provide and install a fixed weir level control device (see contract drawings) to maintain water level in the channels.
B. One low-level sensor shall be included for each UV channel, provided by the Manufacturer. The level sensor shall be point level, conductivity type. Refer to Section 40 70 00 for requirements.
C. If the level sensor detects a low water level in any mode of operation, then all associated lamps shall be extinguished, and the operator shall be alarmed via HMI indication and I/O annunciation.

2.12 ELECTRICAL:

A. Electrical supply to UV system shall be as follows:
   1. Main control panel: 120Vac, 1 phase, 60Hz.
      a. SCCR: 22 kA.
   2. All other equipment: 480 volts, 3 phase, 3 wire.
      a. SCCR: 65 kA.

B. The power distribution panels shall have a single input circuit breaker rated at 480V, 3 phase.
   1. Circuit breakers shall be supplied with an external operator that allows system de-energization without having to open the panel.

C. Main control panel and components shall conform to Section 40 67 00. Provide a main input circuit breaker supplied with an external operator that allows system de-energization without having to open the panel.

D. The power distribution panels and control panel shall have Surge Protection Devices as specified in Section 40 67 00 – Process Control Panels and Hardware.

E. The UV disinfection system shall be supplied with all required power distribution and ballast panels, control panel and shall include all components for the power distribution, protection, regulation, control and monitoring.
   1. Manufacturer shall provide power distribution and control power transformers if required to provide a fully operational system.

F. The ballasts shall be electronic microprocessor controlled, high power factor type (0.95 or higher) designed for ease of maintenance and shall include the following features.
   1. Ability of automatic re-start attempts three times before giving a lamp failure indication to the monitoring system.
   2. Variable power settings adjustable manually or by means of the UV system PLC. Each bank shall have the ability to vary power output with a minimum range of 60% to 100%.
   3. Total harmonic current distortion shall not exceed 10% and total harmonic voltage distortion shall not exceed 5% measured at input terminals to UV system.

G. Provide electrical demand (kW) transducer to measure system output power. The UV system PLC shall monitor the demand and transmit to the Plant Control System.

H. Provide electrical enclosure in accordance with Section 40 67 00. NEMA ratings shall be as follows:
   1. NEMA 12 - System Control Center.
   2. NEMA 4X Stainless Steel - Hydraulic System Centers, and Power Distribution Centers.

I. If external ballasts are used, the Manufacturer shall provide a climate-controlled enclosure, including climate controls (i.e., temperature, humidity), in the equipment package as specified. Refer to Section 40 67 00 for requirements.

J. The Manufacturers equipment package shall include all electrical equipment necessary to convert the available power to the necessary voltage to operate the system (i.e., autotransformers).

K. Provide all required power, control, and instrumentation cables from the power distribution panel to each associated lamp bank and hydraulic system center.

2.13 UV DOSAGE CONTROL:

A. UV system input flow rate will be provided to the UV control system by the Plant Control System via the Ethernet network.

B. A submersible UV sensor shall continuously sense the UV intensity produced in each bank of UV lamp modules and shall only sense the germicidal portion of the light emitted by the UV lamps as measured at 254 nm. Sensors whose sensitivity to other wavelengths amounts to more than 5% of the total sensitivity shall not be allowed.

C. The UV disinfection system shall utilize the UV sensor and/or UVT analyzer output in conjunction with the UV system input flow rate to automatically control the UV system based on the applied UV dose.
D. The average UV dose shall be calculated using bioassay based on one of the approved third-party bioassay's method and be continuously displayed. Input data for calculation of UV dose shall include transmissivity, lamp fouling, lamp aging, and flow rate.
E. The UV intensity monitoring system shall be field or factory calibrated.
F. The sensor shall be automatically cleaned at the same frequency as the lamp sleeves.
G. Systems that utilize UVT for dose pacing shall include a continuous on-line UVT unit monitor to continuously and automatically track the transmissibility of the effluent at the 254 nm germicidal wavelength.
    1. Manually entering UVT values for dose pacing is unacceptable.
    2. The UVT unit shall include an automatic calibration sequence using 100% distilled water.
    3. The unit shall measure from 0 to 100% with an accuracy of ±1%.
    4. The UVT monitor shall be housed in a NEMA 4X enclosure.
H. The UV Control System shall modulate the lamp output in response to the effluent UV transmission.
I. UV Control System: The UV control panel shall contain all components for a fully functional system. All control panel components shall be completely factory wired. Control panel components and construction shall meet the requirements of Section 40 67 00 – Process Control Panels and Hardware or as listed below.
J. Control panels shall be PLC-based.
    1. PLC shall be Allen-Bradley CompactLogix as specified for vendor-supplied packaged control panels in Section 40 67 00.
K. The control panel shall contain an OIT for local control.
    1. Provide Allen-Bradley PanelView Plus 7 series as specified in Section 40 67 00. All manufacturer supplied graphics and applications shall be developed with FactoryTalk View Machine Edition.
    2. Operator interface shall be menu driven with automatic fault message windows appearing upon alarm conditions.
    3. The screens developed shall conform to ISA 101 "high performance" standards. High use of color and animation graphics will not be accepted.
L. Provide I/O surge suppressors for all I/O points to and from the control panel. See Section 40 67 00 for all requirements.
M. The UV control system shall include the necessary PLC I/O modules for all required equipment, including but limited to:
    1. Influent slide gate actuator for each channel
        a. Discrete Outputs:
            (1) Open
            (2) Close
        b. Discrete Inputs:
            (1) Opened
            (2) Closed
            (3) In-Remote
            (4) Common Alarm
    2. UV transmittance 4-20mA analog input

N. A System Inhibit signal shall be provided to each main control panel from the Plant Control System. The signals shall be communicated via the Ethernet/IP network. If an inhibit signal is received, all associated system equipment shall be prevented from running.

O. Effluent flow signal shall be provided to each main control panel from the Plant Control System. The signals shall be communicated via the Ethernet/IP network.

P. The UV control system shall communicate with the plant PLC via an Ethernet/IP network, all controller I/O shall be accessible via the Ethernet network to the Plant Control System, including but limited to:
   1. Bank Status
   2. Module Status (if required)
   3. Lamp Status
   4. UV Intensity/Transmissivity
   5. UV Dose
   6. Minor alarms, to indicate to plant operators that maintenance attention is required:
      a. Low UV intensity warning.
      b. Individual lamp failure.
      c. Low UV transmittance.
   7. Major alarms, to indicate an extreme alarm condition in which the disinfection performance may be jeopardized:
      a. Remote wiper system inoperable or inhibited (malfunctioned or blocked).
      b. Multiple lamp failure.
      c. Module or bank failure:
         (1) When a current leakage to ground occurs, or excess current draw.
         (2) If a module or bank is unplugged without first being placed in the OFF position.
      d. Low UV intensity.
      e. Low UV transmittance (for UVT dose pacing systems).
      f. Low UV dose.
   8. Run time of each bank shall be monitored and displayed.
   9. Start/stop cycle per bank shall be monitored and displayed.
   10. The system shall be capable of being placed in manual, auto, or off.
   11. Alarms shall identify the affected lamps by an address system and shall specify the lamp (i.e., Lamp No. ##). Individual lamp status shall be displayed on the operator interface.
   12. The following signals will be calculated at the plant PLC based on other inputs:
      a. Low UV Intensity/Transmissivity Alarm
      b. Low UV Intensity/Transmissivity Warning
      c. Low UV Dose

Q. The panel manufacturer shall provide a data/memory map to the project's systems integrator which includes all produced tags and coordinated IP addresses as required in order to enable communication between the control panel and the communication network.
   1. The manufacturer shall be responsible for programming and verifying the IP Addresses, Subnet, and Default Gateways, when applicable, for all devices on the network.
   2. The network IP addresses shall be defined and provided by the Systems Integrator based on the Ethernet Network TCP/IP Addresses provided later. Contractor to coordinate between Systems Integrator and Manufacturer accordingly.

R. The System Control Center shall cycle banks for equal wear and timed off to minimize bank cycling.

2.14 SPARE PARTS:

1. The following spare parts and safety equipment shall be furnished:
   a. 5% UV lamps.
   b. 5% ballasts.
   c. 5% lamp sleeves.
   d. 5% lamp sealing rings.
   e. 100% wiper housings and wiper rings.
   f. Forty (40) gallons of recommended cleaning solution (if required).
   g. Two face shields shall be provided to block UV light wavelength between 200 nm and 400 nm.
   h. Two pairs of gloves for handling UV lamps and sleeves.

B. The Manufacturer shall provide a lamp disposal program that includes accepting spent lamps at no cost to Owner. Owner shall pay for shipping costs for return of lamps to the Manufacturer.

2.15 ANCHOR BOLT ASSEMBLY:

A. Complete anchor bolt assembly (studs, nuts, washers, etc.) to be designed by the manufacturer and provided by the Contractor. Anchor material shall be 316 SST. Anchor size and embedment shall be clearly shown on the equipment drawings.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. The Contractor shall install equipment in conformance with the Manufacturer's written instructions.

B. The Contractor shall accurately place anchor bolts using templates furnished by the Manufacturer.

C. The Contractor shall coordinate and arrange with Manufacturer an appropriate time to verify and accept proper installation. Manufacturer shall provide certificate of proper installation to Contractor, Owner, and Engineer prior to performance testing.

3.02 FIELD QUALITY CONTROL:

A. Installation Check:
   1. The Manufacturer shall provide the services of a factory field engineer to initially check installation of the equipment, make electrical control panel modifications as necessary, and to place the equipment in service.
   2. The field engineer shall also be responsible for instructing operating personnel as to proper operational process and maintenance procedures.

B. Mechanical Startup Tests:
   1. After equipment is completely installed and the qualified representative of the Manufacturer has checked the installation and found it to be in accordance with the Manufacturer’s recommendations, a field mechanical startup test shall be performed by the Contractor with the assistance of the Manufacturer’s field representative. The Owner and Engineer will observe all tests. The date for the start of testing shall be set in mutual agreement with the Owner.
   2. All equipment shall be calibrated in the presence of the Engineer before and after the tests. Contractor and equipment manufacturer shall provide any information requested by the Engineer.
   3. All labor, materials, and test apparatus necessary for conducting the field acceptance test shall be furnished by Manufacturer at no additional cost.

3.03 PERFORMANCE AND DESIGN VERIFICATION:

A. Performance testing shall be conducted during startup at the project site to verify performance of the UV disinfection system and ensure compliance with this specification.
   1. At a minimum, the testing shall include a measurement of UV dose and influent/effluent *E. Coli* counts. The testing shall be at a minimum frequency of once every two hours for a duration of three days. All testing shall be completed during an eight-hour day shift.
   2. The Manufacturer is responsible for all costs associated with performance and design verifications with the exception of providing flow to the UV system, which will be provided by the Contractor.
   3. In the event the UV disinfection system does not meet the design criteria specified, the Manufacturer shall provide, at no cost, all equipment necessary to ensure compliance with this specification.

3.04 MANUFACTURER'S SERVICES:

A. Refer to Division 1.
B. The equipment shall be started by a manufacturer's representative, who shall certify to the Engineer that all equipment is properly installed and the plant operator has been instructed concerning proper operation and maintenance. Operator training shall include all items contained in the operation and maintenance manual.
C. Manufacturer's Authorized Representative: Present at work site or classroom designated by the Owner, for the minimum person-days listed below, travel time excluded.
   a. Two (2) person-days for installation assistance, inspection, and certification of installation.
   b. Two (2) person-days for testing.
   c. One (1) person-days for pre-startup classroom or job site training. Training shall include, at a minimum, proper operation, proper maintenance, troubleshooting, handling/disposal of lamps, safety, and calibration of instrumentation. The session shall also be attended by the local equipment manufacturer's representative.

END OF SECTION 46 66 00

SECTION 46 71 33 – ROTARY DRUM THICKENER EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY:

A. This Section covers design calculations, process guarantee, labor, materials, equipment, and incidentals required for delivery to the project site ready for installation, testing and startup for two (2) complete rotary drum thickener systems, with components and accessories, as specified herein.

B. The equipment package shall include:
   1. Two complete rotary drum thickeners (RDTs) with motors, drives, flocculation tanks, spare parts, sludge hoppers, and special tools.
   2. Each complete RDT package shall include a dedicated main control panel and a remote OIT control panel.
   3. Any additional equipment accessories not specified but that are required to achieve the minimum specified performance.

C. The RDT system will be served by three (3) Thin Sludge Pumps. Pump No. 1 will be dedicated to RDT No. 1, and Pump No. 3 will be dedicated to RDT No. 2. Pump No. 2 will be a swing pump capable of feeding either RDT. Thin sludge will be transferred from aerated Thin Sludge Storage Tanks. The RDT will be located in the Solids Processing Building. Construction materials shall be as specified and as required for corrosion resistance.

D. The specified equipment furnished under this section shall be fabricated, assembled, and tested in full conformity with the Specifications, engineering data, instructions and recommendations of the equipment Manufacturer.

E. Related Work Elsewhere:
   1. Painting and Coating: Section 09 90 00.
   2. Pressure Piping: Section 33 11 00.
   3. Process Control Panels and Hardware: Section 40 67 00.
   4. Instrumentation for Process Systems Section 40 70 00.
   5. Progressive Cavity Pumps Section 43 23 57.
   6. Rotary Lobe Pumps: Section 43 23 58.
   7. Common Motor Requirements for Water and Wastewater Equipment: Section 46 05 13.
   8. Polymer Preparation and Feed System: Section 46 33 33.

1.03 SUBMITTALS:

A. Submit in accordance with Division 1.
B. All submittal data shall be labeled in English units. All Drawings shall be drawn to scale, and text shall be in English.
C. Submit contact names, addresses, and telephone numbers of at least two (2) similar municipal wastewater installations that have been in operation in North America for at least two (2) years. Referenced installations shall have RDT specifically designed for municipal thickening of waste activated sludge only (no primary or blended sludge).
D. Submit copies of process performance testing requirements and performance guarantee.
E. Manufacturer shall provide a statement indicating the Manufacturer's understanding of the warranty requirements.
F. Submittals shall include, but not limited to, the following:
1. Dimensional layout for RDT, flocculation tank, sludge hopper, bypass system components, and electrical components, including control panels.
2. Manufacturer's specifications.
3. Rated capacity for all components under anticipated operating conditions. Manufacturers that submit a RDT rated capacity not adequate per design requirements will not be accepted.
4. Fabrication and erection drawings.
5. Detailed equipment drawings.
6. Detailed equipment foundation drawing sealed by Missouri Licensed Engineer.
7. Parts listing.
8. Protective coating systems.
9. Electrical schematic control diagrams, wiring diagrams.
a. All diagrams shall be complete and have uniquely numbered terminals, wires and devices.
b. Control wiring diagram showing wiring terminations for all external connections.
c. External connection diagrams between plant and vendor control panels.
10. Process and instrumentation diagrams (P&IDs).
11. Control panel layout with devices and nameplates shown.
12. Motor nameplate data.
13. Performance Testing Program.
14. Operating weight of unit and load distribution.
15. Past performance test on sludge type being dewatered, that shows unit meeting performance requirement of this specification.
16. Bearing life calculations based on design load sealed by Missouri Licensed Engineer.

17. Catalog cut sheets for all electrical devices which completely indicate all electrical ratings.
18. Electronic and paper copy of the PLC operating program, control screens and complete documentation for approval and Owner's use in installation and integration with the plant control system.
19. Submit a complete list of all PLC I/O addresses used. Each address shall have description that completely identifies what the corresponding address represents, (i.e. "Drum Drive Speed") and what the status of this address corresponds to.
20. Written work plan for field erection.
21. Refer to Section 40 67 00 for additional submittal requirements pertaining to control panels.
22. Refer to Section 46 05 13 for additional submittal requirements pertaining to motors.

G. Operation and Maintenance Manuals.
   1. The manuals shall be prepared specifically for this installation and shall include all required catalog cuts, drawings, equipment lists, descriptions, and other information that is required to instruct operation and maintenance personnel unfamiliar with such equipment.
   2. Special shipping, storage, protection, and handling instructions including dimensions of each container or package shipped.
   3. Recommended unloading method at project site including implement (e.g., forklift, etc.) and maximum container or package weight.
   4. Manufacturer’s printed installation instructions.
   5. Descriptions of system components.
   6. Overview of RDT design that meet these Specifications, including, but not limited to:
      a. Feed capacity.
      b. Acceptable loading conditions.
      c. Design flow and total solids for thickener feed, filtrate, and thickened solids under design operating conditions.
      d. Typical polymer feed rates.
      e. Wash water supply requirements.
   7. Specific instructions for typical laboratory procedures for operation control testing or references to published sources of such instructions.
   8. Descriptions of process control systems.

H. Manufacturer’s Certificate of Proper Installation in accordance with Section 01757 - Commissioning.

I. Submit complete, signed report of results of field inspection, operation, adjustments, and tests. Include the Manufacturer’s certificate that, as a result of Manufacturer’s inspection(s), the Manufacturer’s equipment has been found to be ready for permanent operation and is installed in accordance with the Manufacturer’s instructions.

1.04 QUALITY ASSURANCE:

A. All items of equipment specified herein shall be furnished by one Manufacturer. This Manufacturer shall have the responsibility of providing the equipment, accessories, installation supervision, and testing services required to provide a functioning system.

B. Like items of equipment provided hereunder shall be the end products of one Manufacturer in order to achieve standardization for appearance, operation, maintenance, spare parts, and manufacturer's service.

1.05 DELIVERY:

A. Equipment shall be shipped pre-assembled to the degree that is practicable.

B. Manufacturer shall provide storage instructions indicating specific requirements to ensure there is no damage to or deterioration of components.

1.06 PERFORMANCE GUARANTEE:

A. Provide a written guarantee that the thickener shall meet the specified operating requirements described in PART 2.

B. The ability of the equipment to accomplish the results stipulated shall be determined by a performance testing program using laboratory tests by standard laboratory procedures as outlined in the latest edition of Standard Methods.

C. Performance testing program shall be as described in PART 3.

1.07 WARRANTY:

A. The manufacturer shall warrant that all Equipment shall be free of defects caused by faulty material or workmanship and shall replace those parts for at least a period of one (1) year from the date of start-up.

B. Multiple warranties for individual components shall not be acceptable.

PART 2 - PRODUCTS

2.01 MANUFACTURERS:

A. Materials, equipment, and accessories specified in this section shall be products of, or provided by:

1. FKC.
2. Parkson.
3. Andritz
4. JWC.

2.02 GENERAL:

A. The RDT shall thicken sludge by means of a rotating wedge-wire or perforated drum. The rotary drum thickener shall continuously receive and thicken sludge, passing filtrate through the openings in the drum. The thickened sludge shall be conveyed towards the discharge end of the drum. Thickened sludge will discharge at the end of the drum and be directed to an attached sludge hopper. The sludge hopper discharge shall consist of a 6-inch flanged connection.

B. Each rotary drum thickener shall be a complete thickening unit consisting of, but not limited to:

1. A structural frame, support structure.
2. A flocculation tank with variable speed mixer.
3. A thickening drum with variable speed drive.
4. An automatic drum wash system.
5. A drainage system.
6. Main Control Panel with PLC and OIT.
7. Remote Mounted OIT Control Panel.
8. All appurtenances required for the operation of the unit.

C. Primary control for the rotary drum thickner, and polymer preparation and metering system shall be through the rotary drum thickener control system. The RDT Control System will have

the ability to control all elements of the thickening process including: the Thin Sludge Pumps, flocculation tank, rotary drum thickener, polymer feed system, and wash water system.

1. The RDT Control System will interface with the polymer system local control panel for feed start/stop, system fail, metering pump feed rate, and polymer pacing rate via an Ethernet/IP communication link

D. All equipment shall be furnished by the manufacturer of the rotary drum thickener. The manufacturer shall provide a standard design, modified as necessary to meet the specifications herein.

E. The rotary drum thickener manufacturer shall be responsible for the proper operation and integration of all equipment provided under this Section.

F. The thickener shall be designed for disassembly of all components, including removal of rollers, and to provide accessibility for lubrication, inspection, mechanical adjustment, replacement of parts, and all other maintenance activities.

2.03 DESIGN AND PERFORMANCE CRITERIA:

A. Sludge Characteristics:

1. The wastewater treatment plant includes influent screening by 6 mm perforated plate screens, grit removal, and granular activated sludge biological treatment. Sludge from the biological treatment system is stored in the aerated Thin Sludge Holding Tanks prior to thickening.
    a. The rotary drum thickener system will be designed to receive waste sludge from the Thin Sludge Holding Tanks, with a total solids concentration between 0.5-2.0% wt.

B. Design Criteria:

1. Feed Sludge (Thin Sludge):
    a. Design Solids Loading: 1250 dry lbs/hr.
    b. Expected Feed Solids: 0.5-2.0%.
    c. Maximum Hydraulic Loading: 250 gpm.
    d. Minimum Thickener Solids Recovery: 95%.
    e. Minimum Thickened Solids Concentration: 5%.
2. Maximum Polymer Consumption: 14 lbs/dry ton solids based on 100% active product. Polymer consumption shall be determined by the quotient of the actual weight of polymer used/dry ton solids divided by the published % active product and the specific gravity of the emulsion.
3. Thickener Solids Recovery:
    a. Minimum 95% solids recovery with feed solids between 0.5-1.0% total solids.
    b. Minimum 97% solids recovery with feed solids between 1.0-2.0% total solids.
    c. Minimum 98% solids recovery with feed solids greater than 2.0% total solids.
4. Thickener shall be able to operate at a feed solids concentration up to 3.5% total solids at a reduced hydraulic loading rate.

2.04 MATERIALS OF CONSTRUCTION:

A. Materials used during manufacture of the RDT equipment shall be on the highest quality used in general commercial practice. Material shall be free from all defects and imperfections that may affect serviceability of the finished product. Used equipment, material, or parts will not be allowed.

B. Structural steel support members supplied by the rotary drum thickener manufacturer shall be 304L stainless steel.

C. Materials used shall conform to ASTM standards where such standards exist. Materials used shall be selected based on their continuous and successful use under similar service conditions.

D. Structural frames, plates, and shapes shall have a minimum thickness of 1/4-inch, unless otherwise specified. Bolts shall have a minimum diameter of 5/16-inch.
E. All wetted components, including, but not limited to, frames, flocculation tank, thickener cover, drain pans/trays, drain piping, wash piping, wash shower header and nozzles, and discharge hopper shall be fabricated of Type 304L stainless steel, or be of other, engineer-approved acceptable corrosion-resistant material.
F. All fasteners, pins, anchor bolts, washers and other hardware shall be Type 304L stainless steel.

2.05 SLUDGE CONDITIONING:

A. General:
1. The rotary drum thickener shall be furnished with a sludge conditioning system, designed to efficiently mix polymer with thickener feed sludge and to adequately condition the sludge for optimum thickener performance.
2. Sludge conditioning shall be initiated by injection of polymer through an injection ring located directly upstream of flocculation tank on the sludge feed piping. An additional polymer feed injection point is provided around 20-25-ft upstream of the flocculation tank. Sludge conditioning shall be completed in the flocculation tank upstream of the rotary drum thickener.
3. The manufacturer shall supply the polymer injection ring loose for installation by Contractor.
4. All wetted parts of the sludge conditioning system shall be constructed of 304L stainless steel.
   a. Aluminum shall not be acceptable.
5. All parts requiring regular maintenance, operational adjustment, lubrication or cleaning shall be readily accessible.
6. Components associated with polymer injection ring shall be hydrostatically tested by the manufacturer at the factory. Any components that associated with the polymer injection ring that exhibit leaking or decreases in pressure under field testing shall be repaired or replaced by the rotary drum thickener manufacturer at no additional cost to the Owner. Repaired systems shall be retested.

B. Polymer Injection Ring:
1. The injection ring shall have four separate injection points located 90 degress from each other for injection of polymer solution into the sludge feed piping.

C. Polymer Manifold:
1. The polymer manifold shall split the polymer feed line into four distinct injection lines for connection to the polymer injection ring.

D. Flocculation Tank:
1. The flocculation tank shall be constructed of 304L stainless steel throughout. The flocculation tank shall be self-supporting and shall have furnished stainless steel supports as required. The final dimensions of the concrete pad shall be coordinated during shop drawing review.
2. The flocculation tank will be designed for a hydraulic retention time of one (1) minute or greater under the design conditions specified herein.
3. The flocculation tank shall be equipped with a 6-inch flanged inlet connection located at or near the bottom of the tank, and a 6-inch outlet connection between the flocculation tank and rotary drum thickener. Final elevation of the inlet and oulet connection shall be coordinated during Submittal review.

4. The flocculation tank shall be supplied with a double vertical, flat blade impeller, mechanical mixer.
5. The mixer shall be equipped with a drive motor in accordance with Section 46 05 13.
   a. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. A high temperature detection shall be interlocked to prevent the VFD from powering the motor.
   b. Provide motor shaft grounding ring to discharge shaft currents to ground.
6. The mixer motor speed shall be adjustable with a manufacturer supplied VFD.
7. The top of the flocculation tank shall be covered with a removable, hinged access cover to allow regular inspection and maintenance. The access cover shall be facing south. Refer to drawings for orientation of floc tank.
8. Provide a point level switch with 2" NPT connection on tank lid for detection of high tank level. Manufacturer shall provide necessary equipment and recommendations for install to prevent false high level readings from splashing of liquid. Refer to Section 40 70 00 for other point level instrument requirements.Flocculation tank shall be connected to the rotary drum thickener in a manner that allows foul air to flow with the sludge to the hopper.

E. Thickener Distribution:
   1. The thickener inlet shall be designed to evenly distribute flow to the rotary drum thickener. Rods or bars that will trap stringy material shall not be used.

2.06 ROTARY DRUM THICKENER:

A. Main Structural Frame:
   1. The main structural frame shall be of electrical weld construction fabricated of 304 stainless steel structural members of sufficient design to support all components and accessories.
   2. The stainless steel frame shall be designed in accordance with the AISC Manual of Steel Construction, 15th Edition, ANSI/AISC 360-16, and AISC Design Guide 27 – Structural Stainless Steel, as applicable. Frame shall be designed for the loading from the equpiment under all possible opreations states, and for loadign as specified in ASCE 7-16.
   3. The structural frame shall be designed for installation on multiple 304L stainless steel legs anchored to a grout leveling pad with anchor bolts. The final dimensions of the stainless-steel support legs shall be coordinated during shop drawing review.
   4. Base frame disassembly shall not be required for removal of the drum or other mechanical components.
   5. No disassembled component, excluding the thickener frame, shall weigh more than 6,000 pounds. Lifting lugs shall be provided as necessary, but shall not restrict maintenance access points for the thickener.

B. Spray Shields/Cover:
   1. The drum shall be fully enclosed by removable spray shields located along each side of the thickener and a removable cover shall be mounted on the top. The cover hood shall be fabricated with handles to allow manual removal.
   2. The spray shields shall be designed to contain any fugitive spray and minimize mist emissions.
   3. The spray shields and cover shall be constructed of 304L stainless steel, with minimum 14-gauge thickness. Inspection doors shall be provided with neoprene seals around all openings to provide a water-tight fit. The thickener enclosure shall be equipped with a 6-inch diameter, flanged port on top of the cover to accommodate a future vent connection. A 6-inch blind flange and neoprene gasket shall be provided.

4. Manually removable doors or covers shall be equipped with handles and fastened with wing nuts, or another fastening system that allows for operator removal without special tools. If special tools are required for removal, manufacturer shall provide tools required for removal of doors or covers.

C. Rotary Drum System:
1. The drum shall be fabricated with a filter screen on the drum support structure, which rotates horizontally around a center feed assembly. The filter screen shall consist of stainless steel woven-wire mesh, wedge wire, or other filter material selected on the basis of porosity or percent openness, the opening size, and wire diameter used in the weaving process. The wire mesh, wedge wire, or other filter material shall be selected on the basis of maximizing flow and producing a high-quality filtrate.
2. The filter screen shall be changed from the drum support structure with simple tools. If special tools are required, manufacturer shall provide tools for complete disassembly of filter screen.
3. The rotary drum structure shall be constructed of 304L stainless steel.
4. The rotary system shall be equipped with internal mechanisms to influence shear, water release, and drainage rate independent of flow.
5. The inside of the drum shall have a series of angled flights welded to the interior to transport solids through the length of the drum.
6. Trunnion wheels, if required, shall be constructed of high-density polymer with an aluminum hub and dual-sealed, press fit steel tapered roller bearings. The bearings shall be lubricated by means of an external grease zerk and internal grease cavity located in the trunnion wheel shafts. The bearings shall remain sealed on the outer face with lubrication seals. Grease relief ports shall be provided to the exterior unit to confirm that proper lubrication of the bearing has been achieved.
7. The trunnion wheels shall be removable without the need for the drum to be removed from the unit. Cantilevered trunnion wheels shall not be allowed.
8. The drum may be constructed with a structural shaft along the centerline of the drum supported by pillow blocks and bearings on either end of the machine outside the process environment. The center shaft design shall not require internal trunnion wheels.
9. The rotary drum shall be equipped with a drive motor in accordance with Section 46 05 13.
    a. Provide two normally closed temperature switches embedded in each phase winding for high temperature protection. A high temperature shall prevent the VFD from powering the motor.
    b. Provide motor shaft grounding ring to discharge shaft currents to ground.
10. The rotary drum motor speed shall be adjustable with a manufacturer-supplied VFD.

D. Thickened Sludge Discharge Hopper:
1. Thickener manufacturer shall provide fully removable thickened sludge discharge hopper.
2. The thickened sludge hopper shall be constructed of minimum 14 gauge 304L stainless steel.
3. The structural design of the hopper, connections to the rotary drum thickener,and/or its floor supports shall be designed in accordance with the requirements for structural steel.
4. The hopper shall be designed to be supported off the rotary drum thickener frame, or with floor supports. At design conditions, the weight of the hopper and its contents shall not be transferred to the connected thickened sludge piping or pumps.

5. Hopper interior and exterior surfaces shall be smooth and free of sharp edges and burrs. All welds shall be ground smooth.
6. The discharge end of the thickener shall be supplied with covers which prevent splashing of thickened sludge outside of the hopper. The covers shall be hinged and gasketed to allow observation and inspection of the thickened sludge discharge.
7. The sludge discharge hopper shall be designed and fabricated by the thickener manufacturer. The discharge hopper shall be constructed with one (1) 6-inch diameter flanged connection at the bottom of the hopper to connect to the suction piping for thickened sludge pumps. The flanged connection at the bottom hopper shall be at an elevation approxiamtely 32 inches from finished floor. Final elevation shall be coordinated during Submittal review.
8. The discharge hopper shall be sized to provide adequate working volume for operating thickened sludge pumps without running dry.
9. At the top of discharge hopper, a conductive type point level switch for high sludge levels shall be provided. Manufacturer shall provide necessary equipment and recommendations for install to prevent false high level readings from splashing of sludge. During startup and commissioning, the switch on each hopper shall be field verified to function. Refer to Section 40 70 00 for other point level instrument requirements.
10. Thickener manufacturer shall provide one (1) minimum 2-inch flanged connections on discharge hopper for mouting of a hydrostatic pressure transducers. Manufacturer shall provide pressure transducer in accordance with requirements of Section 40 70 00.
11. Thickener manufacture shall provide one (1) 1 ½-inch NPT connection for a wash water connection on the discharge hopper.
12. Discharge hopper shall be designed to allow near-complete drainage through bottom flanged connections.
13. The final sizing and dimensions of the thickened sludge discharge hopper shall be coordinated during shop drawing submittal review.

E. Drum Wash System:
1. The washing system shall be designed to utilize:
    a. Process water (wastewater treatment plant effluent), supplied at a minimum pressure of 50 psig and maximum pressure of 75 psig.
    b. If wash water system requires a pressure greater than 75 psig, a booster pump shall be provided with the RDT system.
2. If necessary, design and supply for Contractor installation, a pressure reducing valve and 40 mesh strainer system.
    a. Pressure reducing valve shall be capable of reducing maximum potable water or plant service process water pressure to required pressure.
    b. Strainer shall be oversized to accommodate the flow equivalent to twice the normally required wash water flow. Strainer shall be easy to remove for inspection and maintenance cleaning.
3. The spray tube and nozzle assembly shall be readily removable.
4. Nozzle spacing and spray pattern shall be such that the spray patterns from adjacent nozzles overlap one another at the drum surface.
5. Wash water supply to the drum and sludge hopper shall each be automatically controlled with a dedicated manufacturer-supplied solenoid valve.
    a. Solenoid valve shall have minimum NEMA Type 4X enclosure, 120 VAC operation, and minimum Class F coil insulation.
    b. Solenoid valve shall be furnished with manual/bypass operators.

6. Spray header shall be fitted with stainless steel pressure gauge, liquid filled type with a 1/4-inch NPT back connection, 2-1/2 inches dial scaled at 0/160 psi.
7. Washing system shall include an adjustable flow or pressure switch that shall relay an alarm if the solenoid valves on the the wash water system fails and water can no longer be supplied to the spray header or sluge hopper.
8. All structrual components of the wash system shall be constructed of 304L stainless steel.

F. Filtrate Drainage:
1. A drainage pan shall be designed and attached to the structural frame underneath all elements of the rotary drum system and supporting frame. The pan shall be accessible for cleaning.
2. The drainage pan shall be constructed of 304L stailess steel. Drainage piping shall be corrosion resistant and rigidly secured to the frame.
3. Drainage pan shall be of adequate thickeness and have suitable reinforcement to not allow bending, creasing, or tearing from water loads during design conditions and from removing from the frame for service or access.
4. Delivery of collected filtrate water shall be by gravity through one 8-inch flanged pipe stub. Provide a 1-inch flange stub on the bottom of the filtrate drain pipe connection for sampling purposes.

G. Zero Speed Detection:
1. The rotary drive shall be provided with a zero-motion detector. In the event that movement is not detected, an alarm shall be relayed from the zero-motion detector.
2. The zero-motion detector shall be calibrated to operate between the minimum and maximum recommended speeds of the rotary drum system.

2.07 ROTARY DRUM THICKENER CONTROL PANELS:

A. Main Control Panel:
1. Two (2) main control panels shall be furnished in accordance with Section 40 67 00.
   a. Panel mounted combination main disconnect switch and circuit breaker shall be accessible without opening the door.
2. The control panels shall adhere to the following specifications:
   (1) Enclosure Rating: NEMA 12, painted steel, ventilated.
   (2) Voltage: 480 Volt.
   (3) Phase: 3 Phase.
   (4) Frequency: 60 Hz.
   (5) SCCR: 65 kA.
   (6) Mounting: Free Standing or Floor Mounted.
   (7) Logic: PLC.
3. Each Control panel shall contain all timers, starters, VFDs, switches, indicator lights, and other components necessary to operate the following equipment:
   (1) One (1) Flocculation Tank Mixer Motor.
   (2) One (1) RDT Drum Drive Motor.
   (3) One (1) Drum Wash System.
   (4) One (1) Hopper Flush Water System.
4. The point level switch control relays shall be installed within the associated main control panel.
5. Control panel shall be PLC based.
   a. PLC shall be Allen-Bradley CompactLogix according to Section 40 67 00.
6. The main control panel shall contain a door mounted OIT for local control.
   a. OIT shall be Allen-Bradley Panel View. Refer to Section 40 67 00.

b. All manufacturer supplied graphics and applications shall be developed with FactoryTalk View Machine Edition.
c. The screens developed shall utilize a "High Performance" design conforming to ISA 101.01 – Human Machine Interfaces for Process Automation Systems to provide situational awareness to the operator. HMI design and associated color schemes shall conform to those listed in Section 40 61 96 – 3.02 HMI STANDARDS AND SCREEN DEVELOPMENT.
d. In addition to controlling the Manufacturers equipment the supplied PLC and OIT shall be used for interfacing specified I/O with the Plant Control System screens.
(1) Coordinate with the Systems Integrator for exchange of the necessary I/O.
e. The RDT supplier shall provide a copy of the supplied OIT screens for use in the plant control system operator screens.
(1) Manufacturer shall provide the necessary coordination with the Systems Integrator to ensure a fully functional application for use in remote monitoring.

7. The RDT control panel PLC shall communicate with the plant control system PLC via an Ethernet/IP network, all controller I/O shall be accessible via the Ethernet network to the Plant Control System.
8. The control panel shall be supplied with a 480-120V control power transformer to provide power to 120V devices in the panel.
9. The control panel shall include provisions for connection of one (1) 120Vac, 20-Amp field supplied circuit and the internal derived 120Vac circuit from the specified 480V-120V CPT. The CPT derived circuit shall be used as "House" power for lights, fans, receptacles, etc. The field connected circuit shall be derived from the centralized UPS system and shall power all PLC, network, OIT, and control system related loads within the control panel.
10. The following devices shall also be provided in the control panel door at minimum.
a. Push-to-test Power On indicating light.
b. System Emergency Stop push button.

B. The control panel shall be supplied with applicable control relays and time delay relays with a minimum one extra normally closed and one extra normally opened contact is provided for each relay.

C. Remote OIT Enclosure:
1. Each RDT shall be supplied with a remote OIT enclosure for local control of the RDT equipment. The enclosure shall include the following as minimum:
a. Operator interface terminal mounted to the face of the enclosure.
b. Door mounted push-to-test control power indicating light.
c. Emergency stop push button.
d. Additional physical interfaces may be provided as recommended by the manufacturer.
e. Provide with the necessary 120Vac main circuit breaker, Power Supply, Terminal Blocks, OIT, and other internally mounted accessories as required.
f. Enclosure and all externally-mounted accessories shall be rated NEMA 4X SST. Refer to Section 40 67 00 - Process Control Panels and Hardware for enclosure requirements.

D. RDT System OIT:
2. All local operator interface with the rotary drum thickener shall be accomplished via an operator interface panel mounted in the face of the RDT Main Control Panel in

accordance with Section 40 67 00. Each RDT shall be provided with a Remote OIT Enclosure that can access the same functionality.

3. As a minimum, the following control functions shall be accessible via the OIT interface:
   a. System:
      (1) Alarm silence and reset.
      (2) Hand/Off/Auto selector switch.
      (3) Auto Start and Stop buttons.
      (4) System reset push button.
      (5) Emergency stopped indication.
      (6) Elapsed time meter.
   b. Washdown/Wash water System:
      (1) Hand/Off/Auto selector switch.
      (2) Cycle on indication.
      (3) Start and Stop (open) buttons.
      (4) Valve open indication.
      (5) Failure indication.
      (6) Low pressure alarm.
   c. Hopper water flush system:
      (1) Hand/Off/Auto selector switch.
      (2) Cycle on indication.
      (3) Start and Stop (open) buttons.
      (4) Valve open indication.
      (5) Failure indication.
   d. Rotary drum thickener:
      (1) Hand/Off/Auto selector switch.
      (2) Start and Stop buttons.
      (3) Speed adjustment.
      (4) Speed indication.
      (5) Thickener ready indicator.
   e. Flocculation tank:
      (1) Hand/Off/Auto selector switch.
      (2) Start and Stop buttons.
      (3) Running indication.
      (4) Speed adjustment.
      (5) Speed indication.
      (6) Alarm/failure indication.
   f. Polymer system:
      (1) Pump No. 1 selection.
      (2) Pump No. 2 selection.
      (3) Hand/Off/Auto selector switch.
      (4) Start and Stop push buttons.
      (5) Running indication.
      (6) Speed adjustment.
      (7) Speed indication (0-100%).
      (8) Alarm/failure.

E. The following I/O points will be read/write from others to the RDT control panel via an Ethernet/IP communication link. Each point shall be changeable via the OIT.
   a. Thickened Sludge Pumps:
      (1) Thickened Sludge Pump Remote Manual Start (Discrete).

(2) Thickened Sludge Pump Remote Auto Start (Discrete).
(3) Thickened Sludge Pump Off (Discrete).
(4) Thickened Sludge Pump Speed Control (Analog, 0-100%).

F. The following signal inputs will be provided by the RDT control panel to others via an Ethernet/IP communication link.
   a. System:
      (1) Emergency stopped indication (Discrete).
      (2) System failure (Discrete).
      (3) System Running In-Auto (Discrete).
   b. Washdown/Wash water System:
      (1) Low pressure alarm (Discrete).
   c. Discharge Hopper:
      (1) Level (Analog, 4-20mA)
      (2) High level alarm (Discrete).
   d. Rotary drum thickener:
      (1) In-Auto indication (Discrete).
      (2) Running indication (Discrete).
      (3) Common alarm (Discrete).
      (4) Zero speed alarm (Discrete).
      (5) Speed indication (Analog, 0-100%).
   e. Flocculation tank:
      (1) In-Auto indication (Discrete).
      (2) Running indication (Discrete).
      (3) Common alarm (Discrete).
      (4) High level alarm (Discrete).
      (5) Speed indication (Analog, 0-100%).
   f. Thin Sludge Feed:
      (1) Thin Sludge Pump Start/Stop (Discrete).
      (2) Thin Sludge Pump Speed Control (Analog, 0-100%).
   g. Polymer System:
      (1) Feed Pump No. 1 Start/Stop (Discrete).
      (2) Feed Pump No. 1 Speed Control (Analog, 0-100%).
      (3) Feed Pump No. 2 Start/Stop (Discrete).
      (4) Feed Pump No. 2 Speed Control (Analog, 0-100%).

G. The following signal inputs will be provided by others to the RDT control panel via an Ethernet/IP communication link.
   a. System:
      (1) System Inhibit.
         (a) Discrete signal which prevents all associated system equipment from running.
   b. Polymer system:
      (1) Feed pump run status.
      (2) Feed pump failure.
      (3) Feed pump in "AUTO" mode.
      (4) Feed pump motor overload.
   c. Thin Sludge Feed:
      (1) Thin Sludge Pump run status.
      (2) Thin Sludge Pump speed indication (0-100%).
      (3) Thin Sludge Pump failure.

(4) Thin Sludge Pump in "AUTO" mode.
(5) Thin Sludge Flow.
(6) Thin Sludge TS Concentration.

d. Thickened Sludge Feed:
(1) Thickened Sludge Pump run status.
(2) Thickened Sludge Pump speed indication (0-100%).
(3) Thickened Sludge Pump failure.
(4) Thickened Sludge Pump in "REMOTE" mode.
(5) Thickened Sludge Flow.
(6) Thickened Sludge TS Concentration.

H. The panel manufacturer shall provide a data/memory map to the project's systems integrator which includes all produced tags and coordinated IP addresses as required in order to enable communication between the control panel and the communication network.
1. The manufacturer shall be responsible for coordinating, programming, and verifying the IP Addresses, Subnet, and Default Gateways, when applicable, for all devices on the network.
2. The network IP addresses shall be defined based on the Ethernet Network TCP/IP addresses provided by the Systems Integrator.

2.08 RDT CONTROL SYSTEM DESCRIPTION OF OPERATION:

A. Each RDT control panel shall include a control system capable of independent operation.
B. Each rotary drum thickening system and associated components shall be started and stopped at the HMI by Hand/Off/Auto operation selection.
C. In general, each piece of equipment is provided with a Hand / Off / Auto switch. To operate the system from the Thickener HMI, all equipment should be placed in "AUTO". During normal operation, the switches will be left in the Auto position. There is a light indication for each item if it is running.
D. HAND Mode:
1. When any RDT equipment is in HAND control, starting and stopping of motors, the speed of motors, and opening and closing of valves shall be manually controlled at the control panel HMI.
E. AUTO Mode:
1. The following equipment shall be confirmed to be In-Auto before initiating the AUTO operation sequence:
a. Flocculation Tank Mixer Drive
b. Rotary Drum Thickener Drive
c. Wash Water Solenoid Valves
2. The following equipment shall be confirmed to be remotely available via the Plant Control System before initiating the AUTO operation sequence:
a. Thin Sludge Pumps
b. Polymer Feed System
c. Thickened Sludge Pumps
3. The rotary drum thickening control system AUTO mode shall be initiated at manufacturer control panel HMI.
4. Once the start sequence is activated, the Thin Sludge Pumps, Polymer Feed System, and the Flocculation Tank shall start.
a. The manufacturer provided PLC shall send a start command to Thin Sludge Pumps with the pump speed input selected via the PCS.

b. The manufacturer PLC shall send a start command the flocculation tank mixer. The flocculation tank speed is based on the user defined setpoint at the RDT control panel HMI.

c. The polymer feed system shall receive control signals from the RDT control panel via the PCS to initiate pump start and pump speed. The pump speed will be based on the user defined setpoint as a ratio of the sludge flow.

(1) When "Polymer Pacing Mode" is selected, the polymer pump speed shall be determined by the following equations to be included in the PLC:

(a) $$Neat\ Polymer\ Flow\ Rate\ (0-5gph) = Polymer\ Ratio\ \left(\frac{lbs\ active\ polymer}{DT\ of\ WAS}\right) * \frac{1DT}{2000\ lbs} * Influent\ Flow\ (gpm) * \frac{60\ minutes}{hour} * \frac{Influent\ Total\ Solids\ \left(\frac{mg}{L}\right)}{119826\ (conversion\ factor)} * \frac{1}{Specific\ Gravity * 8.34\frac{lbs}{gal}} * \frac{1}{Active\ Polymer\ Content\ (\%)}$$

(b) $$Polymer\ Pump\ Speed\ from\ RDT\ Control\ Panel\ (0\%-100\%) = \frac{Calculated\ Neat\ Polymer\ Flow\ Rate}{Pump\ Capacity\ at\ 100\%}$$

(c) $$Dilution\ Water\ Flow\ Rate\ (gpm) = Neat\ Polymer\ (gph) * \frac{1}{\%\ Polymer\ Diltuion} * \frac{1\ hr}{60\ minutes}$$

(2) In "Polymer Pacing Mode", the feed flow and total solids inputs into the control loops shall be relayed by 4-20 mA signals from the PCS to the RDT control system. There shall be an option in the RDT control system to manually input a total solids value (0-80,000 mg/L) for control rather than a communicated value from the PCS.

d. The rotary drum thickener shall start with the Thin Sludge Pumps, Polymer System, and Flocculation Tank. The speed of the thickener will be based on the user defined speed setpoint at the RDT control panel HMI.

e. The Thickened Sludge Pumps shall have the option to be operated independently from the rest of the system and shall operate based on level in the hopper. These pumps shall vary their speed to maintain the volume of solids in the discharge hopper based on the operator level setpoint.

f. The solenoid valve controlling wash water for rotary drum thickener shall open when the thickening is running.

5. The operator interface display shall have a readout of the following but not limited to:
   a. Neat Polymer feed rate (0-5 gph)
   b. % Speed of the rated capacity of the polymer feed pumps (0%-100%)
   c. Recommended dilution water flowrate for polymer feed system(gpm).
6. The submenu in the PLC shall have the following inputs but not limited to and shall be adjustable at the RDT control panel HMI:
   a. Active polymer ratio (0-14 lbs of active polymer / dry ton of solids)
   b. Polymer specific gravity (1.00-1.20)
   c. Active polymer content (0%-100%)
   d. Dilution water % (0-1%)
7. The rotary drum thickening control system and associated equipment shall have three options for shutdown, all of which are operator selected.
   a. Manual Shut-Off
      (1) The system shall stop when the "System Stop" is selected at the RDT control panel HMI.

b. Timed Shut-Off
   (1) The system shall stop after an operation timer has elapsed. Timer shall be adjustable from 0-24 hrs.
c. Totalized Flow Shut-Off
   (1) The system shall stop after an operator-adjustable, totalized thin sludge flow set point has been reached.

8. The normal shutdown sequence shall stop the sludge pump, polymer system and flocculation tank. The rotary drum thickener shall run for the additional time manually inputted and adjusted at the RDT control panel HMI (Thickener Shut-down Delay) and then set to off. The wash water solenoid valve for the rotary drum thickener shall automatically close when the thickener is off but shall remain on during the system clean out delay shutdown sequence. The thickened pump will continue to run until the volume in the hopper reaches the desired hopper level setpoint.
   a. When "Flush Mode" is enabled, the solenoid valve supplying wash water to the sludge hopper shall open after Thickener Shut-down Delay timer has elapsed.
   b. The solenoid valve shall close after an adjustable Flush Mode wash water timer has elapsed.

2.09 PAINTING:

A. All steel surfaces, excluding the structural frame and those specified to be stainless steel or galvanized, shall be completely painted in the shop with the protective coating normally recommended by the manufacturer for the service intended.
B. Provide field touch-up paint kit for each manufacturers coating system used.

2.10 SPARE PARTS:

A. Manufacturer shall provide a complete parts list, showing current price and anticipated delivery time for each part. Prices shall be held firm for at least one year after the date of equipment startup.
B. The manufacturer shall furnish recommended spare parts and special tools required to minimize rotary drum thickener system downtime. All tools and spare parts shall be packaged and labeled as to be clearly identified for their intended purpose and as labeled as spare parts.
C. One set (each) of any other parts recommended by manufacturer.
D. If specials tools are required for the service and maintenance of any component furnished by the rotary drum thickener system manufacturer, one complete set of special tools shall be provided.
E. All spare parts shall be in waterproof packages suitable for export service labeled with the description and parts number. Each item or set of parts expected to be installed at one time shall be individually packaged.
F. Furnish all required lubricants along with a maintenance schedule showing the required maintenance and frequency of maintenance for the first year of operation, including standard oils and grease, break-in lubricants, special lubricants, and required containers, pumps, hand pumps, or other devices necessary to store and apply the lubricants.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. The rotary drum thickener and accessory equipment as specified herein shall be installed as recommended by the manufacturer. Any additional power, piping or accessories recommended

by the thickener manufacturer shall be provided by the Contractor and shall be the responsibility of the Contractor.

B. Equipment delivered to the site in advance of installation shall be stored in accordance with the manufacturer's requirements and in accordance with the requirements of Division 1.

C. Factory representative shall be present when rotary drum thickener are initially moved into the Sludge Process Building and shall provide a written certificate of no machine damage upon completion of the move. The manufacturer shall coordinate all PLC programming with the installing contractor for verification and checkout of all I/O addressing prior to equipment startup.

3.02 PERFORMANCE TESTING:

A. After installation and prior to performance testing, the rotary drum thickeners shall be completely tested functionally in both AUTOMATIC and HAND modes. Included in the testing shall be a complete test of the PLC and interlock functions.

B. Performance tests shall be run to ensure that each rotary drum thickener perform as specified for peak loading conditions.

C. Performance testing shall be conducted to simulate peak solids and hydraulic loading, as permitted by field conditions. The rotary drum thickener shall be run at the maximum hydraulic loading rate as specified in this specification.

D. Performance testing shall establish the peak hydraulic flow rate, up to the rated capacity of the feed pumps, through the rotary drum thickener without degrading the thickener performance.

E. During the testing period, the rotary drum thickener shall be operated by the Owner's personnel under the direction of the supplier's field representative.

F. Performance testing shall include selection of optimal polymer and determination of optimal polymer dosing rate.

G. Testing period shall begin only after the manufacturer's field representative has instructed the Owner's personnel on equipment operation and the field representative confirms that these personnel are qualified to operate the equipment.

H. Testing period shall begin after the rotary drum thickener is in full operation.

I. Performance Testing:

1. Testing program shall consist of tests taken during a consecutive two-day period of operation. Duration of test each day shall be four hours.
    a. Samples shall be grab samples taken hourly during working day.
    b. Locations of where samples are to be taken shall be determined by the Engineer at the beginning of the testing program.
2. Laboratory tests shall be done by an Engineer-approved independent testing laboratory. Engineer shall receive a copy of laboratory test results direct from laboratory.
3. Laboratory tests shall be those required to determine if the design requirements specified in PARTS 2 and 3 are met.
4. Solids concentrations shall be based on total solids.
5. Chemicals and power supplied by Owner. Any other costs associated with the performance testing will be the responsibility of the Contractor.

J. Submit four copies of a written report of the results to the Engineer within 10 days after completion of the testing program. Report shall include all data required to calculate unit performance.

K. If the results of the performance tests are unsatisfactory, the Contractor shall make the necessary modifications to comply with the requirements at no additional cost to the Owner. After the modifications are made, the performance tests shall be repeated at no

additional cost to the Owner up to three times in order to meet performance requirements. If the results of the performance tests are unsatisfactory after three trials the Owner may at his option keep all or part of the performance withholding.

L. If the equipment fails to meet the requirements of the performance tests, the Contractor may, at his option, install equipment of another manufacturer in order to meet the performance tests. Any equipment changes and additional performance testing shall be done at no additional cost to the Owner.

M. Unsatisfactory performance shall be determined by Engineer based on written report and laboratory data of performance testing, for minimum thickened solids concentration, minimum solids recovery and polymer requirements as specified in PART 2.

N. Compliance with the performance requirements of these specifications will not relieve the Contractor from his responsibilities to supply a rotary drum thickener with the structural, mechanical and operational characteristics specified.

3.03 MANUFACTURER'S FIELD SERVICE:

A. Field service shall be provided by experienced representatives of the equipment supplier.

B. Services are to be provided:

1. As required during installation to ensure proper installation of the equipment. To include, but not be limited to, four (4) 8-hour days.
2. As required to ensure proper start-up to include but not limited to two (2) 8-hour days.
3. During the full length of the performance testing period.
4. Training of Owner's personnel in operation and maintenance of equipment shall be prior to performance testing and shall be a minimum of one (1) 8-hour day.

END OF SECTION 46 71 33
